THE BUILDING NEWS

AND ENGINEERING JOURNAL.

NATIONAL COMPETITION DRAWINGS, SOUTH KENSINGTON.

TO have brought under our notice the results of a nation's activity in any branch of industry or in any acquirement, displayed in such a way as to give us an opportunity of judging of its merits and defects, its weakness or its strength, must surely be a matter of interest to everyone who pays attention to what is going on around him. The annual art competition at South Kensington has peculiar claims upon our attention, not only in this respect, but because we have here the means of examining and comparing, from year to year, the progress and development of an uniform system of education, comprehensive in its character and national in its distribution and operation. Probably there is no other country in which such a gathering as this takes place, or in which such an opportunity is afforded of studying the working of a national scheme of education. Those who have watched the School of Art movement from its origin, 33 years ago, at Somerset House, as the School of Design, down to the present time, must have been struck with the facility with which the first idea of training up a small number of men as designers for our native manufactures has been merged into the more catholic aim of providing a certain amount of art tuition for all. Government art-teaching is now, in fact, provided at the most moderate sum, not only for the children of our national schools, but also for those of the wealthiest classes, and to all of them alike is annually offered a long series of medals and prizes.

Before proceeding to notice this year's competition in detail, we must protest against the arrangement of the drawings. The revolving frames, though they provide us doubtless with a very clever and successful method of economising space, are anything but suitable for such an exhibition as this. It is of paramount importance, for purposes of study and comparison, that the works should be so set out that each class or stage may be separately and minutely examined and referred to. Now with the present plan this is all but impossible, and in order to find out the premiated work in the Antique, we had to turn over about 20 frames, at the risk, as it was, of missing the drawing we were in search of. We may suggest, even now, that it would be as well to remove the gold medal works, and to assign to them a more prominent position, say on a screen by themselves.

The prizes at the disposal of the examiners were 10 gold, 20 silver, and 50 bronze medals, and such minor prizes of books as might be called for by excellence of the works submitted. Of the ten gold medals, eight only have been awarded, three of which fall to the Central School at Kensington. To Mr. T. M. Rooke is due the honour of gaining this year the gold medal for the Antique, for a very clever and careful drawing of the Laocoon. He has made considerable use of the stump, and avoided entirely the mannerism in his shading which has been of late years rather the fault of the chalk drawings in this stage. Four silver medals have been awarded for drawings from the Antique to Messrs. J. Blair, Edinburgh, and C. H. Macpherson and Miss F. L. Sothern, of South Kensington. Mr. Blair and Mr. Macpherson each take two silver medals, the former having gained one for a group in oil, both of the latter gentleman's awards being from the Antique. As examples of conscientious and careful drawing, the premiated works may well be studied. The head of the Laocoon forms the subject of the work both of Miss Sothern and Mr. Macpherson, while Mr. Blair's drawing is from the Cymbal Player, Mr. Macpherson's second medal being obtained for a study of the Discobolus. The gold medal in Stage 15, for painting from still life, is awarded to a charming group of fruit and china, by Mr. John Bathe, of Manchester. The Manchester School is very strong this year in this stage, a silver medal falling to Mr. J. A. Hague, and a bronze one to Mr. Somerset, the other medallists in painting being Miss. M. N. Webb, of the Bloomsbury School, and Mr. E. J. Parker, of Carlisle. No gold medals have been adjudged to the oil-paintings from the life, though there is a very creditable display of works. Miss E. Gregory obtains a silver medal for a delicate and beautifully executed head of an Italian peasant woman, and bronze medals are awarded to the female heads by Miss Kate Seymour and Mr. M. D. Webb, of the Dublin School. The sculpture and modelling are certainly below the mark, and there is a dearth of works in this stage; in fact, we are at a loss to understand, even as it is, why some of the works here have been sent forward for competition. In one corner of the room, however, is the really clever work of Mr. Tinworth, of Lambeth School, Hercules strangling Antæus, not in competition, this gentleman having gained the silver medal of the Royal Academy, and being thus rendered ineligible to compete except in the stage of Applied Design. The strong competition, after all, is as it should be in Stage 23, Applied Design, and in this stage the whole of the remaining gold medals have been awarded. It is interesting, in going over the drawings, to find how strongly local manufactures have provided subjects for the ingenuity of the designers. This, we take it, is a very healthy sign, and proves that the Schools are doing good work in educating designers, and preparing them, by a systematic course of training, for future usefulness to our manufacturers. Thus from Nottingham, the larger proportion of the designs are for lace, from Coventry, ribbons; from Birmingham, metal work and jewellery; from Coalbrookdale, encaustic tiles; from Kidderminster, carpets, &c.

We cannot do better than commence our notice of this stage with the Architectural designs, which come more specially into our province. Mr. Andrew F. Brophy, whose name we have had to notice on several former occasions, takes off the chief honours—a gold medal, for a set of drawings for a drinking fountain. It is more, we imagine, for the care and study which Mr. Brophy has bestowed upon the details and enrichments of his work than for the design itself that the medal has been awarded, the composition, as a whole, being feeble and nondescript in style. We suppose that it would be called Italian. An octagonal grey granite basin, supported by eight columns, with white marble caps and red shafts, stands upon a granite plinth, and is surmounted with a solid and rather clumsy finial, from the sides of which the water issues from four shells of the most ordinary and commonplace character. The enrichments consist of four allegorical heads above, representing the Seasons, and four typical panels of flowers and fruit below them, all to be executed in mosaics, some ornamental ironwork being introduced in the recesses between the panels and as cresting above the water jets. The whole of these decorations are very carefully drawn, and coloured on the sheet of details (where is the third sheet?) with an amount of power and vigour which must make most architectural draughtsmen envious. A silver medal has been awarded to Mr. James J. Woodsend, a builder's clerk at Nottingham, for a perspective and sectional view of a church. By removing a portion of the transept and chancel, we are presented at once with a part exterior part interior view of the building. Drawings of this character seem to us always a species of architectural gymnastics, and perhaps for this reason we are tempted to be hard upon Mr. Woodsend. It would appear, however, that only one drawing of the set has been entered for competition, and as this gives anything but a favourable notion of the design, we will not form our opinion upon it. Bronze medals have been awarded to two students of the S. Martin's School for architectural designs —to Mr. George L. Luker, for a club-house, very neatly and carefully tinted in Indian ink, and to Mr. John A. Langston, for a design for civic buildings. This latter drawing is placed too high for minute inspection, but, at any rate, ought to have been accompanied by a plan of some kind. Mr. A. Reading, of Birmingham, has received a local medal for his design for a public library and museum, very good in execution and characteristic in style. Very noticeable also are the two sheets of designs for four shopfronts by Mr. W. T. Hollands, of Lambeth. Two of these fronts present us with an attempt to adapt the old half-timbered style to our modern requirements. We fear that not only would the District Surveyor step in, but that we should find a difficulty in constructing the over-hanging upper story in the manner indicated in the section. As endeavours to improve the normal state of things, we may welcome any attempt at novelty, though we fear Mr. Hollands will have to consult the Building Act before he goes in for woodwork and gables. Mr. James Smellie, of Glasgow, has a design for a mansion house in the Castellated style, which is the very essence of feebleness. We hoped the time had gone by for country villas with windows down to the ground and upper stories loop-holed for guns, and with battlements and angle turrets *ad libitum*. We cannot say much, either, for the church by Mr. W. Lake, of Norwich. Mr. Atkinson, of Chester, sends us a very creditable design for a shopfront in the half-timbered style. With such excellent Mediæval examples around him, Mr. Atkinson should, however, have learnt to avoid the tendency to a stone treatment which is manifest in some of his canopies and pendentives. Mr. G. Wormal's drawing of a

Norman gable at Lincoln Cathedral has gained him the prize-books; the fault of his work is that the shadows are too black. Mr. A. Foster, of Lincoln, has obtained a similar reward for his interior perspectives of a church, apparently his own design. Mr. John Howitt, of Nottingham, presents us with a design for a memorial-cross, in which a belt of very ordinary arcading is made to do duty thrice over at three different levels. Perhaps the three tiers of angels in Mr. G. G. Scott's monument in Hyde-park may have been considered a sufficient precedent for this repetition of details, but the effect in Mr. Howitt's case is not successful. There is not a better drawing in the room in point of manipulative excellence than Mr. C. W. Appelgren's Restoration of the Choragic Monument of Lysicrates, beautifully drawn and delicately tinted. The Gothic villa by Mr. T. B. Horsfield, of Halifax, is Gothic only because the windows happen not to be flat-headed. The engineering drawings are few in number, and have failed to obtain any of the principal honours. We notice very careful drawings by Messrs. D. Russell, of Carlisle; C. F. Curtis, of Lincoln; Wm. H. Evans, of South Kensington; and David Cameron, of Dundee. Mr. Talbert would be flattered if he could see what an ardent admirer he has in Mr. W. F. Randall, of South Kensington, whose designs for furniture, rewarded with a bronze medal, are surely founded upon a careful study of that gentleman's work. The pianoforte on Sheet I we should have liked better had the colouring been less forcible, but the pen-and-ink drawings on Sheet II are capital, especially the smaller cabinet, which is very original and good. The design for a chancel-screen of wrought iron by Mr. J. J. Trego, of Nottingham although unrewarded, is very characteristic and well suited to the material. So also is the design for iron gates by Mr. W. W. Clausen, of South Kensington; in fact, we are surprised that so excellent a drawing has been passed over by the examiners. The sheet of enlarged detail is beautifully drawn and tinted, and the enamelled iron work is suitably and judiciously introduced. To Mr. George Clausen, of South Kensington, has fallen the gold medal for surface decoration. His sheet comprises five designs for wall decorations, drawn to various scales, the central design only, founded upon the white lily, being drawn full size. This reduction in the scale of the designs gives him an advantage over some of his competitors. The examiners must have been much puzzled in awarding the prizes for decorations in such varied subjects among such a number of competitors, many of whom are so nearly equal in merit. From Coventry we have a group of designs for watch cases, for card backs, and for ribbons, evidently, from the similarity of their motive, inspired from the same source. Are we right in conjecturing that they have been consulting Mr. Westwood's very erudite and magnificently illustrated work? For the watch-cases Mr. James Friday receives a bronze medal, for the card backs Mr. J. Frost, and for the ribbon Mr. Walter Scott, the silver medal for ribbons being awarded to some admirable designs by Mr. E. A. Buckley. The lace designs from Nottingham are this year very numerous. We find that the practice of working in body colours on tracing paper, backed with some coloured paper, is almost universal, and results in a representation of the real material so natural in many cases as quite to deceive the observer, and to lead us to think we are examining the lace itself. Mr. F. B. Heald has obtained a gold medal, and also the Mayor of Nottingham's prize for the best design, while Miss Martha Metcalf, of Bradford, and Miss Agnes Schenk, of Lambeth, have each of them been rewarded with gold medals for designs for this material. Miss Metcalf's drawing, founded upon a very naturalistic treatment of the Dielytra Spectabilis, is especially elegant and pleasing. Messrs. G. F. Turton, G. Broadhead, and A. Read, of Nottingham, Miss M. Mansel, of Kensington, and Mr. F. Brett, of Dublin, likewise receive silver medals for designs for this fabric.* Some excellent drawings of encaustic tiles are sent up from the Coalbrookdale School. Mr. Charles Hughes takes the national prize books for a set of designs, and Mr. Charles Hinley must have run him him very close, for there is little to find fault with in his three very admirably drawn sheets, showing various arrangement of flooring tiles. The bronze medal in this class has been obtained by a student of the Lambeth School, Mr. E. Burbridge. In the same case as the drawings we have just been describing are some very fair designs for jewellery from the Birmingham School, and some elaborate lids for coal boxes or scuttles, likewise from Birmingham; one of them, the work of Mr. Alfred Taylor, is remarkable in that he has selected snow crystals for the motive of his ornament. What possible relation there can be between coal and snow we are at a loss to comprehend. From Birmingham we have also some very fair designs for ornamental metal-work, and some very poor designs for iron gates and grilles. Mr. Charles Emery has a well-studied drawing of a lectern and a candelabrum, but we give him but little praise for his gates. The set of designs for seven-light candelabra were, we presume, executed in competition for some local prizes. With the designs from Birmingham, taking them as a whole, we are anything but satisfied. The commercial flavour of that busy place seems almost to have influenced the art. In most of the designs from this school the idea seems to have been to work more for what would pay and what was suited to the trade than to try after what was good and true in art. In one word, the works are "shoppy," and this school, instead of endeavouring to raise the standard of Birmingham manufactures, has allowed itself to be dragged down and degraded to their level. This is a very bad track for a School of Art to get into, and is an abuse of art training which deserves the most severe censure. We sincerely hope that another year this tendency will be avoided. Mr. W. H. East, of Sheffield, has an excellent design for a silver tankard, and Mr. W. H. Macklen, one for an épergne. The designs by Mr. John Slater, of Stoke, for dessert plates, which fill two sheets, are many of them very novel and richly coloured. It is really impossible to do justice to the very numerous and varied examples in this stage, and we are compelled to pass over many meritorious works. There is as strong a competition as usual for the prizes offered by the Plasterers' Company. The numerous models are exhibited in the galleries south of the Horticultural Gardens. Mr. E. Foot, of Bristol, has an elaborate design for ceiling, and Mr. H. Higgins, of Glasgow, sends a scheme for the decoration of the side of a room. Mr. Foot's work is too gaily coloured, and the scale of the ornament and the panelling, out of keeping. To encourage the study of ornament the Department offers prizes for a sheet treating ornament historically, that is selecting characteristic fragments of the work of different styles and countries, and arranging them in their proper order and succession. Of course Mr. Owen Jones is largely drawn upon for this subject, and we come across a great many familiar details of his Egyptian and Assyrian styles. This kind of work appears to us to be a great waste of labour, and to be a good chance thrown away, for if the student were to study ornament for himself from buildings or works in his own neighbourhood he would do himself far more good than cribbing from a splendid collection like that by Mr. Owen Jones.

The ladies have it all their own way in the flower painting, and very beautiful indeed the works in this class are. The lovely and sweet-scented golden lily forms the subject of Miss A. A. Locke's bronze medal drawing, and similar rewards have been gained by Miss Jessie Field, of Oxford, and Miss C. N. Hill, of Edinburgh. The silver medal has been awarded to Miss F. Seymour, of Dublin, for a lovely watercolour group of wild flowers. Some orchids, by Miss Darling, of Manchester, though exquisitely drawn, have failed to obtain a reward. For drawings from prescribed examples, and for shaded drawings from the cast, several silver and bronze medals have been obtained. Noticeable here are the works of Messrs. R. Thomas, of Oxford, and G. C. Perkins, of Manchester, and a beautifully-drawn spandrel in sepia, by Miss Floyd.

We have thus endeavoured to give some idea of the nature of the exhibition, and to point out a few of the specially deserving works, though we fear we have left many first-rate drawings unnoticed. We began by protesting against the arrangement of the frames. At the risk of being thought ungracious, we must terminate by expressing our surprise at the choice of a gallery in which to place them. Surely the South Kensington authorities must have been at their very wits' end for space before they appropriated the room in which are hung the noble cartoons of Raphael to a collection, however excellent, of mere students' drawings. What a strange paradox to think that the cartoons should ever come to this—the noblest works Art has ever produced frowning down upon the school-work of Great Britain in this year of grace, 1870! Frowning, we say, for the wall space is actually partly taken up with the drawings, and it is impossible to see the cartoons properly on account of the great frames and cases. Surely, if nothing else shows how badly new buildings are wanted at South Kensington, a glance at the dishonoured cartoons would do more than hundreds of official complaints about overcrowding,

We may state, in conclusion, that the number of works sent up this year to be examined was 87,000. The preliminary selection was made by Messrs. S. Hart, R.A., F. B. Barwell, and Eyre Crowe; while the medals were awarded by Messrs. J. C. Horsley, R.A.; R. Redgrave, R.A.; R. Westmacott, R.A.; C. W. Cope, R.A.; E. J. Poynter, R.A.; and H. A. Bowler, Official Inspector; and for the architecture by Sir M. Digby Wyatt and Mr. Fergusson.

◆

THE ARCHITECTURAL EXHIBITION.

(Concluding Notice.)

We have kept our *bonne bouche* of this Exhibition to the last, and cannot take leave of it without noticing the designs for decorations, which form one of its most interesting and valuable features. In this department of decoration we are greatly indebted to Mr. S. Aitchison, who is the contributor of several drawings full of thought, novelty and refinement. We miss in them any decided characteristic style, but they may generally be described as a free treatment of Classic. No. 117, however, necessarily is otherwise, being a design for filling-in with coloured glass some Arab windows belonging to F. Leighton, Esq., R.A These are of a perforated description of slab, the holes arranged so as to form a representation of a flower vase and flowers, surmounted by Arabic writing. A sparkling and brilliant effect is thus produced, which Mr. Aitchison has enhanced by the manner in which he has varied the tints of each petal, while keeping to one colour for each flower. No. 118 is entitled, Decoration of Hall in Mansion at Kensington, for F. Leighton, Esq., R.A. A dado as high as the doorway, the cornices being continuous, with a range of square panels at the top, and long narrow ones below, is carried round the hall, and appears to be of ebonised wood, with sunk circular holes, coloured red in the frieze. Some arabesques of a slightly more lively character are cut into the doorway architrave as embellishments, but, as such, they are of a mild type. The upper part of the wall above the dado is covered with blue ornaments on white ground, executed in tilework brought, we believe, from the East by Mr. Leighton. As such, and valued relics, Mr. Aitchison's treatment of his accessories is commendably self-sacrificial; a strip of orange plain tiles at the angles is rather a startling contrast to the rest. Nos. 121, 122, 123, and 124 are designs by the same architect for pieces of furniture, most of them intended for the Thames Conservancy Board-room, in ebony, enriched with delicate mouldings and inlays of ivory or gilt lines; they are refined, with the exception of the chair, which is of a different and more clumsy type. The features are Classic or Renaissance. No. 116 is a work of a very different character, a startling sketch cartoon for staircase, Tempsford, by J. Moyr Smith. It illustrates Hugh de Payen and Geoffrey D'Adhemar founding the order of the Knights Templars under the patronage of Warmond, Patriarch of Jerusalem, A.D. 1118. Its contemplation has left upon us a vivid recollection of some violently blue legs, belonging to whom we could not aver. The two heroes seem maudlingly drunk, and the Patriarch mildly shocked at so unbecoming a proceeding; he is shaking his head, as if under the melancholy conviction that no good can come out of it, despite the frantic exertions of two acolytes, who look as if they would strain all their sinews in the efforts to swing their censers sufficiently for the occasion. The intention of the work is higher than its execution. No. 131, Sketches for Pottery and Wall Decoration—the Signs of the Zodiac—by the same, is better, as being less pretentious, and really humorous and comic, yet it is questionable if such broad farce is suitable for permanent decoration. The run of fashion, however, is very amusing. Mr. Herbert A. Gribble has an elaborate drawing, No. 119, Design for Bookcase and Decoration of Library, not without merit as a drawing and in some of the details, such as the wall decorations, but the bookcases are fussy and overdone. No. 120, Design for Organ Front, Melbourne, by Mr. Daniel Ruddle, we should have passed but that we regret to see it is said to be in course of actual execution. In No. 130 Mr. H. S. Marks gives us five exquisite bookplates, in which humour and high artistic qualities are combined. Mr. J. D. Crace sends a number of valuable sketches and studies of ancient decorations made abroad. No. 126 is from a ceiling by Ghirlandajo at Florence, from the Capella di S. Bernardo, Pal. Vecchio. The effect is produced by a gold ground, enriched by delicate painting, and contrasted by lines of deep blue in the mouldings surrounding the panels. We should like to know if the original work has the blue so strong an ultramarine. Nos. 133, 4, 5, 6, 7, and 8 are interesting studies of Eastern decorative inlaid and painted work at Damascus and Cairo, by the same hand. They bear the evidence of care and truth, and the colours are as remarkable for their delicacy as the designs for their intricacy. Nos. 138, 9, and 140 are equally interesting and careful studies of the same class in a still more remote field—that of India—by Mr. Emerson. He gives us therein a clear notion of the detail and effect of the wondrous floral inlays of the Taj Mahal. No. 132 is an important drawing by Mr. J. L. Pearson, showing his design for proposed sculpure and incised decoration of the narthex of S. Peter's Church, Vauxhall. Mr. Pearson deserves all credit for the endeavour to introduce art of such character amid plain brickwork, and the suggestions for the designs are good, but they would need to be entrusted to able hands to execute, and, indeed, to be re-cast. We cannot but question whether the incised band above the arches is not on too small a scale in itself, compared, for instance, with the bricks, which are as long as some of the figures; nor do we like the restlessness of effect produced by this band, or frieze, interfering with and interfered by the several arch and window-heads, and should have preferred a belt of sculpture carried in a line with the subjects in the three tympana of the western doorway. Drawing No. 141 is one that calls for notice; it is a part of a design for decoration of vestibule of No. 14, Fitzroy-square, the residence of Mr. Robert W. Edis, by H. S. Marks. Architecture, Painting, and Sculpture aré represented associated as three female figures in a group, and Poetry and Music but slightly separated, one on either side, with a vase holding a flowering shrub between each of these and the triple group in the midst. They each bear the insignia of their craft, and are dressed in flowing robes of sober colour, and the background is divided into four horizontal bands of quiet and retiring tints, various in width, and representing a dado against the sky. We hail this attempt at the improvement of the interior of our dwellings, both at the hands of the artist and the architect. No. 142, Sketch for Sculpture, Islip Reredos, Messrs. Slater and Carpenter, architects, exhibited by D. Bell and Almond, with Nos. 127, 8 and 9, designs for painted windows by the same artists, are in that conventional style of manufactured art which is too common. The figures look as if they would be full of affectation had they any brains for such ideas to enter, but, studied apparently from dressed dolls, we are willing to acquit them of all *malice prepense.* No. 144, Art tiles, and 145, Sketches for Glass, are exhibited under the name of G. E. Cook. We believe they are executed by him from cartoons from artists whose names should be given; they are very charming, and therefore the more reason to give full credit to whomsoever the credit of the various portions of the work is due.

---

* We are informed that the Nottingham manufacturers are very pleased with the designs, and that the best of them will all be executed.

Of another painted or inlaid panel of porcelain, No. 147, designed for the Society of Decorative Arts, by J. Moyr Smith, we are glad to be able to speak well after what we have had to say of other of that gentleman's works. It is somewhat too imitative of lead glazing, and the birds are evident copies of Japanese drawings, but it shows that Mr. Smith can do good work when he condescends to be simple, but when he will not, as in No. 148, sketch for wall decoration in flat tints, subject, Ode to Melancholy, he simply sets our teeth on edge. We turn back to No. 143, an old friend, Dromore Castle wall decoration, by E. W. Godwin, with intense satisfaction, its quiet refinement continuing to grow upon us. We feel we could live in such rooms with satisfaction. A screen in the middle of the large gallery bears six large drawings of furniture and decoration, by Owen Jones, executed by Messrs. Jackson and Graham. These are more to the present taste of the world, full, of course, of a certain facility of design and a certain harmony of effect, but yet lamentable and elaborate perpetrations of the most ordinary upholsterer's type. Nor can we even rest content with the colouring of some of the drawings, in which raspberry-jam, tinted panels surmount an orange-brown dado, and are surmounted by pink, drab, and blue in the cornice. We see here costliness without art, and deeply regret the result.

To "Works of Sculpture," by R. L. Boulton, of Cheltenham, we primarily object with reference to this name he gives them—the more modest title of woodcarver, assumed by Mr. J. Knox, who sends a figure of S. Peter, executed in wainscoat oak, is far more suitable to this class of work. When recommended to us as the meritorious attempts of working men we are disposed to criticise them leniently. It is well that our humbler carvers should strive their best to raise the tone of their work, and their ordinary foliage carving will doubtless be all the better for the practice of carving the figure occasionally; but sculpture such figures are not, and we protest against a contrary assumption, the more because we regret that many of our leading architects seem quite disposed to rest content with such carving instead of art in their works—witness the pulpit in Westminster Abbey, and the cross between puppies and lion-whelps which bark at the base of the Westminster column. If we are to have figures at all, let them have the usual number and position of the joints in the human figure, and though clothed, we seek to see that there are limbs beneath the folds of the drapery, and that the drapery falls according to the laws of nature, and that the pattern of the dress is after some conceivable model. We have yet to learn—perhaps we are inquisitive to ask—something about those of the angels about to decorate the church of Creach Grange, near Wareham, in Dorsetshire.

No. 231 is a cartoon of the Crucifixion, drawn by Mr. Ridley, for E. E. Cooke, Esq., which is effective and clever, and of a different stamp of art, far more promising for the future.

We have now completed our review of this exhibition, with the exception of two or three of the screens which contain the year's sketches of the Architectural Association Class of Design and some interesting photographs which have been sent over by some architects in France. Another screen is also creditably filled with the plates of the Architectural Association Sketch-book, of which we have previously reviewed several numbers.

THEORY OF THE ARTS.

(Continued from page 447, Vol. XVIII.*)*

ROMAN sculpture as a representative art was considerably influenced by the sensual and degrading character of the gross pantheism that prevailed. But besides this influence, there was the national taste for the baser appetites and qualities of humanity. The noble attributes so prized and encouraged by the Greeks in their public contests, and the innocent objects of rivalry of the Olympic games, ceased to have any pleasure for the cloyed Romans, satiated with warlike amusements. The sculpture naturally reflected those passions and distortions of the mind and body which express such emotions; and in the last days of the Republic the art sunk rapidly, notwithstanding the exertions of Augustus to revive it. It is well to note this retrogression in art and the causes which contributed towards it. It seems the first declension of art of which we have record; and every student of Roman history can tolerably well learn the reasons which led to it. In Greece every artist was respected; Socrates pronounced them the only wise men, and other eminent philosophers and statesmen took lessons of art and paid especial honour to artists. Their great artists were also maintained at public expense, as, for example, Polygnotus, the celebrated monumental painter. How different among the Romans! They were, among them, state tools, comparatively speaking. There was no commonwealth of genius and talent. Nor can we say even that in England such an honourable position is awarded to artists, who now frequently depend on the caprice of individuals. Under the Roman sway, there was a suspension of the better emotions and faculties of the mind, its loss of individual freedom, and its slavish subjection to state functionaries. Hence the individual was but a mere unit, existing for the State, not the State for him, as in Greece. In every respect there is a wonderful contrast between Greek and Roman tastes. Thus, in the Greek tragedy, suffering was ideal and ministrative to the soul, not, as in Rome, real torture and blood, to delight a depraved apelite. Roman literature, too, was of the same class, realistic and reflective of the loose morals and tastes of the age; the best authors were but imitators of Greek authors. Of the higher conceptive power the Romans had little or none; they were more perceptive and dictatorial by reason of the very subjection under which they existed.

All these peculiarities of physique and

mental character were reflected in the arts; thus Architecture was stern, stately, dignified, triumphant; sculpture expressed the same spirit, it gloried as being representative of victories, of exhibitions, of animal courage, suffering—brute force rather than intellectual power. Again, let us look at the efforts of the Romans to add to their predecessors' work. We find, for instance, multiplichtion instead of invention—the different orders, for example, piled one over the other; we observe, too, their modifications of the three Greek orders, the Doric, Ionic, Corinthian, and their own supplemental order, the Composite, combined of the elements of the two last. Again, in the Composite Arcade, they combined the Greek entablature and the arch. Hence their power of combination and adaptation was greater than their inventive faculties, or that nice discrimination, adjustment, and gradation of parts which we find in the construction of the Grecian temples. But their adaptation was slow in progress. In the case of the Composite Arcade, the Greek columnar trabeation was for a long time merely a mask placed in front of the arcade. In course of time the entablature yielded to the arched construction, and the first step was to cut away the intercolumnar bit of entablature, only leaving pieces over the columns for the springing of the arches. This double capital was at last superseded by springing the arches directly from the column or pier, thus, at last, arriving at the pure system of arcuation as a distinct method of construction.

Restless for conquest and dominion, the Romans devoted their best energies to military achievement and discipline, not, as with the Greeks, to the more leisurely and refined cultivation of the arts of peace. All they did was thus more to add to the stores of their predecessors, and to attain sumptuousness and splendour for their own aggrandisement, than for the sake of real improvement or for the advancement of the arts. Yet one principle, the arch, was destined to work a great change and revolution in all subsequent architecture; and this expedient they used as much from the demands of their actual requirements as from any other motive. From the Pantheon to the beautiful domed decagonal temple of Minerva Medica, we have a series of examples suggestive at least, if not the very germs, of that constructive system which was destined to change the architecture of the West and East, and give it all that flexibility and adaptation, and that mastery over mere material, and its simple static conditions which so wonderfully strike us in the structures of the Middle Ages. The vaulted basilicas of the Romans, indeed, embraced all the chief constructive points which the Gothic architects developed, though we shall mark an important change in the conceptive power or the expression of the latter's work.

In the East we find Eastern fancy, combined with the practical and regular construction of the Romans, producing quite an original style, devoid of the academic rules of Vitruvius, while in the West the tendency was to develop the most practical features, regardless of the ostentation and regularity of Roman art.

There was a mighty revolution in the modes of life, thought, and action when the dismemberment of the Empire began—a moral change which everywhere exercised a marked influence upon art conception. The dawn of Monotheism itself shed a new light which was soon felt. The world had hitherto been under the dominion of two powers—a free imagination and an unfettered intellect, sometimes in strange reconciliation, and sometimes in violent opposition. There was needed another force to balance them, to bring them to a just agreement. This was the moral power about to be inaugurated. In our next article we will show its influence upon Art, and conclude our historic sketch by a reference to modern art.

(*To be continued.*)

THE EXHIBITION BUILDINGS.

THE buildings in which the Exhibition of 1871 will be held have been designed by Lieut.-Col. Scott, R.E., and are to be of a permanent character. Those persons familiar with the Horticultural Gardens know the long ornamental arcades parallel with the Albert and Exhibition-roads. At the back of these arcades is a piece of waste ground, some 200ft. wide, extending to the road. On these strips of land the two main exhibition buildings are to be built. At their northern ends, these main buildings will be placed in communication with the conservatory of the Horticultural Gardens, and through it with the new Albert Hall of Arts (the grand promenade of which will be utilised for exhibition purposes, the educational collection being placed therein) by covered approaches, which are being made upon the top of the arcades connecting them with the conservatory. The southern ends of the main buildings will communicate with the permanent portion of the Exhibition building of 1862, which forms the southern boundary of the Horticultural Gardens. This building is now used for the exhibition of objects in connection with the South Kensington Museum. By this means, the building will completely surround the gardens, to which the public will be admitted at certain times, and under special conditions which have yet to be decided upon. It is also proposed to connect this series of buildings with the South Kensington Museum, by means of a covered way under the Exhibition-road, and also in the same manner with the Metropolitan Railway. Between the outer walls of each of the two exhibition buildings and the roads upon which they abut, there will still remain a long strip of waste ground, some 160ft. wide, which will allow of the buildings being laterally extended at some future time.

The length of the main buildings, on the ground floor at each side, will be 1100ft., on the upper floor at each side, 600ft. Their width throughout will be 30ft., and the height of the two floors 60ft. The level of such a length of building will be broken each side by four raised pavillions or dwarf towers; four of these on either side of the north and south extremities, will be 35ft. wide, the two centre ones being 65ft.

The ground floors of the building consist of a series of chambers, broken in equal lengths by the varying dimensions of the central portions, the light for which is obtained from large windows in the east and west sides of the respective buildings, but there can, of course, be no windows in the sides which adjoin and continue the present arcade walls.

The lower story will be set aside for the exhibition of woollen fabrics, manufactures, tools, and machinery. The upper floor will be a repetition, on a smaller scale, of the picture-gallery of the Exhibition of 1862; the galleries will have no side windows, but will be lighted with a single centre ridge glass roof. The floor will be fireproof, made on the Fox and Barret principle, of rolled iron girders filled in between with 10in. of concrete, and tiled on the upper surface. Provision is made in the built girders for heating the buildings by means of hot-water pipes, and also for ventilation. These galleries, which are to be 30ft. wide by 25ft. high, will be used exclusively for the exhibition of works of art and art-manufactures, such as painting, bronzes, sculpture porcelain, decorative furniture, jewellery; in fact, every kind of artistic work, whether applied to objects of ornament or domestic use.

On the side of the Albert and Exhibition roads, the buildings will not be excessively decorated. In the front overlooking the Horticultural Gardens, the greatest beauty of the new buildings will be seen. The arcades of the Horticultural Gardens which are only 12ft. wide, are being finished off entirely, and their massive stone capitals and cornices are being carved from designs by the South Kensington art-students. The arcades, which are at present only temporarily covered, are being roofed over in a solid and permanent manner, and will form a promenade on a level with the floor of the picture and art galleries of the upper saloons, with which they will communicate through wide doorway entrances. The side next the gardens will have a handsome terracotta balustrade, from which rise light ornamental carved wood columns, supporting a trellis-work of iron running along the whole length and breadth of the walk. This trellis-work will be interwoven with vines and creepers. The balustrade will contain vases filled with flowers, and a pleasant view will be obtained over the whole extent of the gardens beneath.

The buildings are in the Decorated Italian style, with mouldings, cornices, columns, and courses in buff-coloured terra-cotta; the brickwork being of the hard red Fareham bricks, so as to match the garden architecture, and harmonise with the new Museum buildings which are rising in front of them. The terra-cotta and red Fareham bricks are more durable against a London winter than even granite. The buildings altogether will accommodate 50,000 people.

◆

THE NEW ST. THOMAS'S HOSPITAL.

ALTHOUGH so much has been said and written with regard to Mr. Currey's new hospital at Stangate being perfect, from a sanitary point of view, in plan and arrangement, the *Medical Times and Gazette* regrets to find the communicating corridors running the whole length of the building level with the ground and first floors are not constructed for that amount of isolation it had at first supposed. Our contemporary had imagined that the corridors were the connecting links between the blocks, and that, in the event of erysipelas, fever, &c., appearing in a block, the windows and the corridors would be taken out and the passage closed, so that the only communication would be by the underground passage in the basement. This, however, is not possible, for the whole of the space between the central corridor on the ground floor and that which forms a continuous screen at the back of the first floor is filled up by rooms for the out-patients, dispensary, &c. In each case the light will be very deficient, being for the most part borrowed from the corridors between which they are situated. In the terminal blocks only, or that for the contagious diseases proper, will it be possible to isolate the wards by cutting off these channels of communication, for there are no offices fitted into the space between the corridors leading to this block.

Considerable progress has been made towards the completion of the exterior. The contractors expect to have the roofs completed and the scaffolding down by the middle of July. Two of the blocks are in this forward state now; the stonework has been washed, and they present a very imposing appearance. Up to the present time scarcely any plasterers or carpenters have been at work. Very little progress has been made in fitting up the interior; the walls are just as bare as they were twelve months ago.

According to the plans it is intended to have an open colonnade facing the river, linking together the front facets of each block, and forming the front boundary to the quadrangles. This our medical contemporary very much objects to—1st, because it shuts out some of the light and air from the wards; 2nd, because it is purely ornamental; and 3rd, because the building would be dwarfed by it. The blocks would undoubtedly look more imposing by appearing in relief. Our contemporary is also surprised to find that it is intended to "brick in" portions of the building which cannot be turned to account, and would rather have them left open as air shafts to assist in the ventilation. In some of these spaces water has been laid on, so that lavatories and water closets can be constructed, and there cannot be too many of these. Much has to be done before the building is complete, and the governors and staff may be congratulated if they get into their new building by the middle of next year.

◆

COMPETITIONS.

Bradford Church Literary Institute.—The plans prepared by Messrs. Milnes and France, Mr. W. Gay, Messrs. Andrew, Son, and Pepper, and Mr. S. Ellis, architects, Bradford, in competition for the proposed new buildings in North-parade for the above institute are now on view at the Church Institute, Albion-court, Bradford. The designs are all in the Gothic style, each differently treated. The house in Manor-row is not dealt with, the designers confining their plans to the space at the back of that edifice.

Thorngate Footbridge, Barnard Castle.—The committee for carrying out this work met last week, when the various designs submitted in competition were discussed, and, ultimately, the plan of Messrs. Nimmo and McNay, of London, was adopted, on condition that certain alterations and improvements in it can be made, and a committee was appointed to confer with the engineers on the subject.

Furniture & Decoration.

ON THE USE AND ABUSE OF ORNAMENT AND COLOUR IN THEIR APPLICATION TO HOUSE DECORATION.

(*Continued from page* 468, *Vol. XVIII.*)

A DRAWING ROOM, in the usual acceptation of the term, is substantially a lady's room. It is there she presides and reigns supreme as mistress of the mansion and queen of her company. As a rule, she fills it with articles of bijouterie and knick-knacks—articles which ladies of taste are sure to admire. Rare cabinets, beautiful and exquisite receptacles for everything and for nothing; shells, mounted in gold and ormolu, &c.; easy chairs, couches, ottomans, and every appliance for elegant comfort and cosy chat. The style of its decorations should be in accordance with its general aspect when in use—light, cheerful, and rich.

The ceiling, if it is a moderately-sized room and not enriched with ornament in relief, may be tinted cream colour. A stile may be added next to the cornice, five, six, or eight inches wide, according to the size of the room, which may be tinted of a warm grey; an ornament may be stencilled at each corner, and a smaller one in the centre of each side, between corner and corner, and connected by lines either broken and stencilled, or run continuous with a fitch or flat hoghair brush.

It is necessary to use caution in the choice and size of the ornaments used—caution as to the style, so that it may be in accordance with the architecture of the house, and as to size, so that the ornament shall not be either too large or too small for the room. Many gross mistakes are made in this respect. We often see ornaments on ceilings which are only fitted to adorn furniture, and which are utterly lost on a ceiling, and in other cases we may see ornaments put upon a ceiling ten or twelve feet high large enough for one twenty-five feet high, and of proportionate dimensions. This either proceeds from want of judgment or paucity of design, or, perhaps, what is quite as likely, from the fact that the decorator has the particular design by him ready cut, and therefore does not care to put himself to the expense and trouble of designing and cutting another. We know several cases where the decorator has a stock of stencil patterns, which he uses on all occasions, both in large and small rooms, suitable or not, and he takes care to cut new ones from them before the old ones are worn out—a profitable practice enough, but not very creditable or praiseworthy in the decorator—a practice we would wish to see abolished, as it has a downward tendency, repressing all invention and originality.

In the designing and connection of the corners and centre ornaments, care should be taken to cause the lines to flow out of the corners and form a part of them. A broad line and a fine line look better than a single line, or than two of the same width, either fine or broad. They may be either broken lines with stripes or dots, or interlace one with the other. Their colour, or the tints named above, may be, for the broad line, a dull warm gold or golden brown; the fine line may be either a tint made from vermilion and white, or a reddish mauve. The broad line should not be more than three-quarters of an inch broad on a ceiling of ordinary height, and the fine line about one-eighth. The ornaments may be done in two or three tints, as may be desirable. The larger portion, when the ornament will admit, such as a conventional leaf, may be stencilled from the top to the base with two, three, or four colours blending one into the other, or, in stencilling, the half of the leaf lengthways may be covered with a straight-edged slip of paper while one-half is coloured, then the stencilled half may be covered in the same manner, and the other half coloured, and so two shades of colour, forming light and shade, may be got on the same leaf or ornament. Many good effects may be thus got by very simple means. The cornice, whether plain mouldings or enriched, should be coloured with tints of cream colour and white on the projecting members, and tints of warm grey of different degrees of tone in the coves, quirks, and backgrounds, with suitable tints of red or pink on the under sides or fillets against the darkest grey tints. This causes the grey to look warm, and if the whole is properly balanced, the one colour will blend with the other, and the effect will be a sort of bloom of colour, equalised and toned to perfect harmony. The enrichments may be etched and gilt. A beautiful effect may be got by the judicious use of three colours of gold in conjunction with colour, namely, regular deep gold, middle shade, and lemon gold. The difference in shade of colour depends, of course, upon the amount of alloy in each—and it should be understood that the lighest colour has the most silver in it, therefore is the most likely to tarnish when exposed to contact with the atmosphere, especially on outside work, and it should therefore be well sized before being left for a finish. There is only a certain class or style of architectural ornament that will bear etching with advantage, although we see all sorts indiscriminately etched. The Corinthian capital, and many of the Greek, Italian, and Roman ornaments may be etched, but a very large proportion of architectural enrichments cannot be so treated, and it is wholly out of place on Gothic ornament. We therefore, as a rule, prefer parcel gilding, and those parts should always be selected for gilding which receive and reflect the light best; rounded projections, beads, and hollows, for instance. Flat surfaces seldom reflect the light, and when they do not the gold looks almost black. When only part of an ornament is gilt, the rest of it should be of a cream or gold colour, or other tone of yellow, as these tints blend with the gold, and we thus avoid an abrupt line.

The walls may be done in several ways: when the room is large enough, a good style is to divide each wall into proportional panels, with stiles and pilasters, and gold mouldings. The centre panel on each wall may be filled with a mirror of the same dimension, and finished in the same manner as the other panels. Much care is required in the selection of glass for this purpose, especially in cases where two glasses are exactly opposite each other; for if they are not perfectly level and equal in surface, they distort everything in the room; the cornices of the room and doorways will appear crooked, broken, and falling down, and as there is a double reflection, which causes, as it were, an endless vista of rooms, the distortion is multiplied each time, but if the mirrors are good and true, the effect produced is excellent. The panels and pilasters should be enclosed with two mouldings, or rather a mould and bead, the outside one about one inch wide, more or less, according to the size of room, either with or without corner pieces. The second or inner bead, about half an inch wide, should be placed about three or four inches apart from the outside moulding. We thus get space for three tints of colour. The panels may be of a light warm reddish grey tone; the three inches space between the mouldings may be light pink, and the style cream colour, or the pink and cream colour may be renewed. The panel colour is admirably adapted for the display of gold-framed water colours or engravings. The pilasters may be painted with arabesques of good design, on a cream colour ground. These should never be attempted except they can be well and carefully done, and they should always have a meaning. It is a senseless practice to paint a pretentious style of ornament, and when asked as to its meaning, to be told "Oh! it is an ornament, that is all!" The ornaments of a dining room should have some reference to the purpose for which it is used—fruit, game, implements of the chase, more especially of those animals which are used for food, &c. In the drawing room, we may have the seasons represented by the aid of flowers, birds, butterflies, &c. The wild flowers of the months are a very suitable decoration, unpretentious, and well adapted for arrangement. Large masses of flowers are objectionable. Coloured ornament, enclosing medallions, either of the seasons or classic heads, is also a good style. A less pretentious style of treatment is to put each wall or side of the room into one panel, with gold mouldings, as before, but in this case each panel should have a centre ornament of a proportionate size, placed exactly in the middle of the top lines of mouldings, in order to give elevation, and break the long straight line, which is always objectionable. The form of these and of the corner ornaments must be determined by the style of the room. The centre of panel may, in this case, be either tinted or filled in with a suitable diaper pattern paper. If paper is used we prefer that there should not be any of the so-called gold in the pattern, but when the gold patterns are used for this purpose they should be chosen of as quiet and undemonstrative a pattern as possible. There is a variety of drawing-room papers of recent introduction in which the gold is embossed, and, almost without exception, these patterns are of that spotty character we have before had occasion to condemn. These goods are very beautiful to look at in the piece, but there is a "dot and carry one" character about them we do not like, and after all the gold is but a delusion and a snare, for they will not stand—at all events we have not yet seen any of the gilt papers that will not tarnish, and even in the most favourable situations they will begin to fade or go black in twelve months after being hung. The colour of the stiles of the room will depend upon that of the paper of the panel. A simple and inexpensive manner of treating a drawing room is to colour the walls of some light pleasing tint in distemper, then decorate with a floral border round the top part of the wall about 6in. wide, enclosed in simple gold beads, and forming a frieze; a narrow ornamental border in one colour may also be put round the bottom of the wall about 6in. from the skirting. Many paper hangers make a practice of running borders, and even gold mouldings round the door architraves and round the chimney piece; this is a vulgar practice, something in the paper-trunk style of business, and should be avoided. Many suitable arrangements of borders are manufactured by the paper stainer, and if good taste is exercised in the choice of colour, an excellent effect may be obtained at a slight cost, and we have found in our experience that it is not always the most expensive work which looks the best.

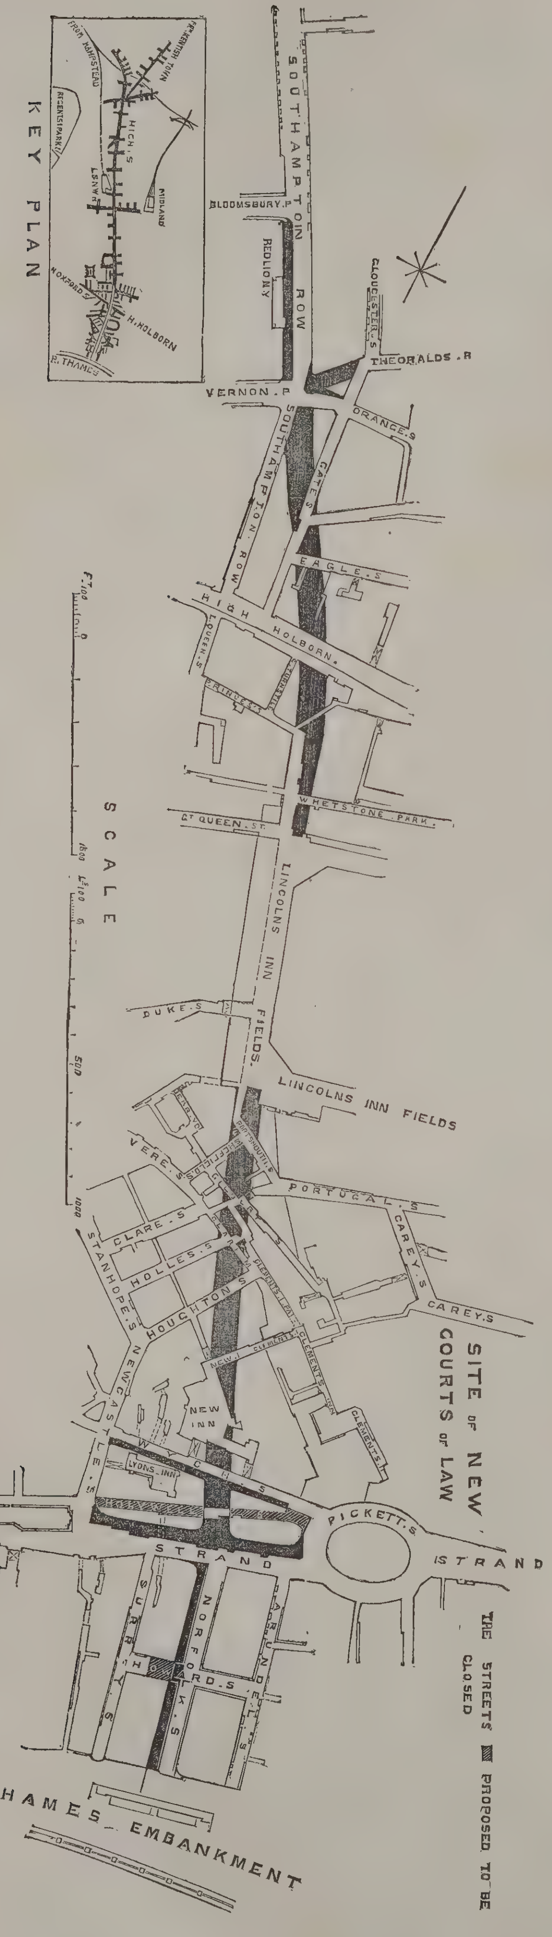
(*To be continued.*)

◆

THE PROPOSED NEW MID-LONDON ROAD AND RAILWAY.

THE means of communication between the East and West ends of London, by road and rail, are by no means inadequate or inconvenient. The two great lines of thoroughfare—Holborn and the Strand—and their continuations, and the metropolitan system of underground communication, are at present tolerably equal to the public want. With regard to the North-Western and Central portions of the metropolis, the case is altogether different. There are no good roads between the three great trunk lines of the Euston-road, Oxford-street, and Holborn, and the Strand and Fleet-street, except Portland-place and Regent-street, and Farringdon-road and street—both circuitous, and at a considerable distance from each other. Means of communication by rail are still worse. The Northern districts are practically isolated from the Southern and South-Western.

A project is now on foot, and has been submitted to the Metropolitan Board of Works, having for its object the constructing a railway extending in a north-west direction to the point where the Hampstead, Kentish Town, and Camden-roads join, connecting the North-Western Railway at Euston-square with the South-Eastern



PLAN SHOWING ROUTE OF PROPOSED NEW MID-LONDON ROAD.

at Waterloo Junction, as shown on the plan which we give. This line would pass under Southampton-row, Holborn, the west side of Lincoln's-inn-fields, Clare-market, Wych-street, Holywell-street, and the Strand, and crossing the river at the point shown by a new bridge, which need not necessarily be a standing disgrace to railway engineers, as are the Cannon-street and Charing-cross bridges. This scheme, as its promoters point out, affords a good opportunity for the Metropolitan Board of Works to co-operate with them in the construction of two short sections of road, 60ft. wide—viz., from Southampton-row through Little Turnstile, to the north-west corner of Lincoln's-inn-fields (not Lincoln's-inn-*square*, as erroneously stated by two contemporaries), and from the south-west corner of Lincoln's-inn-fields to the Strand thus affording direct communication between Hampstead, Highgate, Kentish Town, and Holloway, and the Thames Embankment. A minor, but still important, improvement might be effected at the same time by opening up a direct access to Vernon-place from Theobald's-road.

The promoters have determined to connect the new nlie with the South-Eastern, at Waterloo Junction, rather than at Charing-cross, because of the comparatively immense cost which the route to the latter station would entail; and also because of the consequent necessary widening of the Charing-cross bridge, very undesirable on many grounds The route adopted, moreover, is so direct that it is only a few chains longer than if it took its course down the Hampstead and Tottenham-court-roads, through Leicester-square, to Charing-cross. The gradients of the proposed line are of the first class, the steepest being 1 in 114, except a short rise of 1 in 40 into Euston Station—such a rise at that point being rather an advantage, than otherwise, as it will facilitate the stopping and starting of trains. Another great point is that although the line is entirely underground, no disturbance of the streets will be necessary from Euston-square to the south side of Lincoln's-inn-fields, owing to the great depth at which the railway will be constructed.

Testimony has been already borne by Mr. Layard and Mr. Street to the facilities of access to the site of the New Law Courts which such a street would afford. The gross cost of the purchase of the property necessary to be acquired for constructing the new road, from Vernon-place, Southampton-row, to the Strand, as well as the contemplated improvement at Theobald's-oad, is estimated at £500,000. The sale of surplus property would considerably reduce this sum, and the promoters of the Mid London Railway Company, offer to share with the Board, the nett cost of the new street. The proposal is one not likely to be made again, and we think the Board might fairly support the scheme, both in the interest of the general public, and of the ratepayers, at whose cost, at some time, some such road must be made.

◆

KEEPER'S LODGE AT KIRTLINGTON PARK, OXON.

One of our illustrations this week represents a keeper's lodge at Kirtlington Park, Oxon, built for Sir Henry W. Dashwood from designs supplied by Mr. William Wilkinson, architect, Oxford. The walls are of stone, and are lined inside with brick. The roof is covered with blue slates. The cost of the lodge was about £350.

◆

WHITE COLNE CHURCH, ESSEX,

One of our illustrations this week represents the church of St. Andrew, White Colne, Essex, before and after restoration. The walls of this church, in 1869, were entirely covered with a thick coating of plaster, all the stonework of the windows was decayed, wood mullions and tracery of the "Churchwardens' Gothic" era in one or two instances doing duty for the stone originals. In the interior, both roofs had false plaster ceilings, and whitewash reigned omnipotent everywhere. High pews and a western gallery made the small church appear still smaller and a "three-decker," with sounding board, contributed not a little to this effect. The prevailing style of this church is Late Decorated, but in removing the plastering, blocked up Norman windows, of early date, showed that the church was of still earlier foundation. The work of restoration was commenced in August last, and is now completed. The illustration suffices to show how the restoration has affected the exterior of the building; no further description, therefore, is necessary. In the interior, on the removal of the plaster ceilings, both roofs were found perfectly sound (of the trussed rafter construction), and were accordingly carefully restored. Owing to the use of a sort of soft stone called "clunch," the decay of the mullions and tracery of the windows has necessitated their being replaced with new stone in most instances, but with one exception, the new windows are exact reproductions of the old ones. A stained glass window, by Ward and Hughes, has been placed in the tower, to the memory of the former vicar, plain quarry glazing, with coloured borders, being used for the remaining windows in the church. Open seats have taken the place of the high pews. Proper choir accommodation has been provided in the chancel. The old Elizabethan pulpit has been taken down from its high pedestal, and is now fain to content itself on a more modest moulded stone base. A new font has been given by the parishioners, and Minton tiles have been laid in the nave, chancel, and tower. The work of restoration has been exceedingly well carried out by, Mr. T. Rogers, of Earls Colne, builder, under the superintendence and according to the plans of the architect, Charles J. Moxon, A.R.I.B.A., of 48, Albany-street, London.

◆

The Dome of S. Peter's.—A curious instance of the way in which observation fails to remark familiar sights has recently come to light in Rome. Everybody knows that, while the dome of S. Peter's is the work of Michael Angelo, the rest of the building is from the design of Carlo Maderno; but though thousands have gazed at at the wonderful church, it was only the other day that a French traveller observed that the middle point of the dome and that of the portico do not coincide. The difference between them is nearly 5 ft., and must, according the *Atheneum*, be due either to an original defect in construction, or to subsequent inclination of the axis of part of the building.

Stoke Newington Green.—The Parks and Open Spaces Committee of the Metropolitan Board of Works have under consideration the improvement of this green. There are many literary and historical associations connected with the place. The house in which the late Samuel Rogers, author of the "Pleasures of Memory," was born is still in existence there. It is in contemplation to erect by subscription a statue of De Foe, who was educated and afterwards resided at Newington-green.

BRIEF CHAPTERS ON BRITISH CARPENTRY.

By Thomas Morris.

(Continued from page 478, Vol. XVIII.)

FROM a royal and stately example, highly embellished, and carrying Decorative art to a perfectly dramatic extent, a quality that was soon perceived and turned to account, though it may yet serve as a copious source of suggestion whenever a modern theatre has to be Gothically designed, we turn to a specimen of comparatively plain and humble character. Metropolitan skill and continental adaptations are exchanged for provincial simplicity and domestic forms. Yet both scenes were occasionally trodden by the same august personages.

In a quiet district on the deep clay lies the parish of Crowhurst, surrounded by Limpsfield, Oxted, Tandridge, and Lingfield. It contains the further manors of Grove and Chellows, and Newland, but the population is small and the houses few. It is unnoticed in Domesday, but formed a distinct manor in the early part of the fourteenth century, and was granted by John de Horne to the founder of the Gaynsford family, who was buried here in 1450; and whose descendants long retained the ownership. The circumstances that connect Crowhurst with royal and historic events are perfectly natural. Anne Boleyn, or, according to her own subscription, *Anna de Boullan*, sprang from a race of London merchants, of whom the first was buried in S. Lawrence Pountney. Geoffrey Boleyn, Lord Mayor in 1457, bought Blickling Hall, Norfolk, of Sir John Fastolf; and Hever Castle, Kent, of the Cobhams. Both these seats, and Rochford Hall, Essex, have been named as the birth-place of the Queen, but probability inclines to Blickling. The event would confer distinction on any place for "there is no name in the annals of female royalty," says her biographer, "over which the enchantments of poetry and romance have cast such bewildering spells." But though born elsewhere, it was at Hever Castle that Henry VIII. paid her the homage of his suit, in the happy time before contending parties became detractors, leaving no faithful representation of her moral character, as Holbein has done of her personal beauty. Taking a ride of twenty miles along—

> The rose-hung lanes of woody Kent.

the King would sound a bugle as he reached a neighbouring hill, to give notice of his approach, and the spot is fixed in local tradition. The distance from Hever to Crowhurst being about four miles, it may be assumed that their respective occupants would be on terms of neighbourly intimacy, and one incident especially supports this view. Among the ladies of Anne's retinue, was a fair young gentlewoman, Mistress Gaynsford, beloved of a noble youth, George Zouch, who snatched a book from her hands. It was a copy of Tindal's translation of the Gospels that Anne had lent her, and as it could only be recovered by the King's intervention, he had an opportunity to make an examination that is supposed to have influenced his subsequent proceedings. Crowhurst (a woodland name) lying *en route* from Eltham to Hever, it seems quite probable that the King should have been occasionally entertained here. His visits are, indeed, traditionally attested by a double hedge of yew, in the planting of which his Majesty took part. Another circumstance I may mention, though it was probably not thought of at the time, is the fact that Sir John Gaynsford had been the husband of six wives, affording a singular prefigurement of the destiny awaiting the royal guest received with so much honour and welcome. Sir John, however, had twenty children, Henry only three.

Crowhurst Place must have presented a good example of the Mediæval mansions next in scale to the castle—viz., the moated manor house. The moat and wall, indeed, are still almost entire. The house was chiefly of timber in panels, and the roofs were covered with Horsham slates. There was a room, about 14ft. square, handsomely fitted up, and ornamented with armorial bearings painted on small boards. A larger parlour was splendidly finished with a cornice of openwork, backed by a crimson ground. The ceiling consisted of fluted girders and joists, painted blue, and studded with stars of gilt metal. The entrance-porch has been removed, but the ironwork of the latch, especially a plate of perforated work, with a backing of red Morocco leather, indicates the careful treatment of detail. The Hall was the chief apartment, and though greatly disfigured and disguised by the conversion of the building into a farmhouse, is still the feature of principal interest. The original timber roof remains, and is so perfect and substantial as to be capable of enduring for centuries to come. When Mr. Railton was engaged with the erection of Lingfield Parsonage, it attracted his attention, and the accompanying illustration is based on the accurate particulars he obtained. As the inclosing walls were of timber, and incapable of resisting by mere weight the lateral thrust of a roof, while such expedients as we have seen at Nursted Court* would have curtailed the floor space to an inconvenient degree, the safest, and, perhaps, on the balance of evils, the least artistically objectionable mode was adopted—namely, the introduction of a cross girder. Under somewhat similar circumstances, in the chapel of Croydon Palace (page 285, Vol. XVIII.), a decorative arch was formed under the girder and the upper part of the roof shut off by a ceiling, but at Crowhurst so great a sacrifice was inadmissible, and the cradle roof was determined on. Upon the wall-posts of the opposite sides is laid the strong cross girder, as something to build upon. At the greatest convenient distance from the centre, queen-posts are erected, and their pressure on the girder is relieved by curved struts reaching some way down the wall-posts. Principal rafters incline from the walls towards the centre, resting on the tops of the queens, but are only about two-thirds of the length that would reach the apex of the roof, being stopped at that point by a level strut, under which is a connecting arch. From principal to principal extend massive purlins supporting the stout rafters, which are partly straight and partly curved, a mixture that gives considerable intricacy and richness to the work, without impairing its character as a piece of open carpentry.

Imitation is the strongest proof of admiration. The grand original in Westminster Hall was repeated at Beddington and at Lambeth. Crosby Hall and Christ Church have been renewed in recent examples, and in the booking-office of the Midland Railway, St. Pancras, Mr. G. G. Scott has freely imitated some leading lines of Crowhurst. In the days of its perfection, when furnished with appointments of country state—heraldic emblazonments, stags' antlers, hunting-horns, dog couples, and instruments for the chase, besides weapons and armour of more serious import, the hall must have had a striking effect, but the habits which had called such apartments into existence were in the last stage of transition. The custom of dining here began to decline in the fourteenth century, and was far less generally observed in the sixteenth. In the ordinances of Eltham, A.D. 1526, it is stated that "sundrie noblemen and gentlemen and others doe muche delighte and use to dyne in corners and secret places, not repayring to the Kinge's chamber or hall."

---

* Sutton Courtenay Berks, may be also referred to

The Surveyor-General of Henry VIII. notes repairs to the "Kynge's dynyng chamber and the Queny's dynyng chamber," at the manor of Greenwich. Part of the hall was occasionally screened off for a dining room, or, its lofty proportions ceasing, a room was built above, and the upper classes at length entirely relinquished the ancient usage of dining with their retainers. Effectual State provisions for general domestic safety rendered the great hall of old times unnecessary, and its disuse closed one chief opening for artistic carpentry. But we have a splendid series of originals that ought to be preserved with no less care than would be bestowed on pictures by Raphael or Titian." Our national pre-eminence in carpentry has been too long disregarded, and works whose interest will grow with time, are consequently permitted to disappear. "In short," says Mr. Street, "just as we must give the palm to other countries when we examine the history of groined roofs executed in stone, so it is certain that we have had no worthy competitors in the science of building and ornamenting timber roofs." Roofs do not, indeed, exhaust the subject, but constitute a very important section of British carpentry.

After an interval rendered necessary by engagements, I propose to resume these chapters.

◆

SCIENCE IN ARCHITECTURE.

By Wm. Parslow.*

An architect's specification is a good illustration of what constitutes Science in Architecture. In this paper I purpose dealing with some of the points that the carrying out of a specification suggests.

Foundations, Drains, and Brickwork.

The best foundation, as a general rule, is growing sand, and the least number of settlements are usually observed to buildings upon this foundation. Rock, known to be solid, is equally good, but rock is often treacherous, such, for instance, as may be found about Litherland. Most of the houses in Litherland Park are upon rock, and they have given seriously. Faults in the rock, holes, loose strata, or soft stone underneath may give, and if the rock does give, from any cause, the building receives a shock resulting in the usual defects of serious settlements. Growing sand will not give in this way; it has often a tendency to expand rather than to sink, and if it gives it does so but little, and that evenly, and does not hurt the structure upon it.

For the same reasons that make rock doubtful as a foundation, clay is more so; there may be, though hidden, what are technically termed ravines, or other holes in the clay; these cause the structure to slip. If a solid bed can be assured, the architect may determine upon building without fear, but this is often impracticable. A thin bed of clay with rock underneath is a very treacherous foundation; the clay is almost sure to move, and should be therefore excavated. Cracks in buildings do not always arise from settlements in the foundation, or defective work. All buildings have a tendency to settle and contract as the materials with which they have been built become dry. Brickwork, for instance, must contract and settle to some extent, and stone put into a building fresh from the quarry is more or less wet, and will shrink in some degree while drying. This accounts for the open joints sometimes visible in new buildings; these cannot be altogether avoided; better that this appearance, which can be easily set right, should exist, than the stone be made so tight that it will snap when contraction begins and the materials dry. We require cills and steps to be bedded hollow for this reason, to provide for the results of contraction.

Drainage.

Drains, where there is not much fall, are best of brick or of unglazed tiles; the idea that glazing improves drain tiles for all purposes is not correct. It was at first thought that the invention would cause the soil to pass easily through, but instead of that, experience proves that in flat drainage the soil clings to the glazing far more tenaciously than to the unglazed material. It may be accounted for in this way; the glazing keeps the sides of the drain pipes very dry; they are so impervious that water cannot be communicated from the outside; and soil will cling to the dry article while it will fall from the wet one, or be easily removed by a slight flushing of the pipe. Unglazed pipes are generally wet when in use, because moisture from the outside earth soaks into them, and the moist surface thus presented to the soil keeps the whole in a favourable state for the removal of the soil when a slight flushing takes place. Brick drains are for the same reason much better than glazed stone ware. I have known 6in. drain tiles taken up in the neighbourhood of Liverpool, after having been laid but a year or two, and soil 2in. thick has been clinging to the sides all round, fast, like mortar, leaving but 2in. for water and other drainage to flow through; such pipes must evidently soon become choked up. This instance occurred where the ground was flat. Brick or unglazed pipes should be used in such cases. Where there is a good fall glazed pipes may be used, as they are more durable. Within the last few years we have known drains laid about Liverpool of 18in. glazed pipes where there has not been much fall, and where the drains have often run 18ft. below the ground level; these, it seems to me, are liable soon to choke from the cause named, and then how are they to be cleaned? Flushing will not take the soil off; it clings so fast to the smooth surface that forcible pressure is necessary, and at such a depth it is not safe for men to go down 18in. pipes. A good brick drain would cost very little more, and would answer better in every way. In such rocky ground as is to be found about Liverpool a cheaper drain than the glazed pipe might often be obtained by cutting an opening in the rock and covering it with flags, and this would answer every purpose.

If drains are laid in running sand, it is better to set them in cement, then cover the joints with clay, as the sand will otherwise find its way into the drains before the cement is dry, and choke the pipes; by covering this cement with clay, the latter, which will not at once let the water soak through, becomes a covering to the cement long enough to let it harden, and though the clay will in time be washed away, it will then have done its work.

In ordinary foundations, as generally understood, clay only is the best bedding for drains; there is no fear of the earth or growing sand getting into the pipes, and the clay allows them to yield to a pressure which might break them if set in cement; of course, the danger of the pipes breaking, in case of an uneven pressure, when they are set with cement in running sand, still remains, but this is the less evil of the two, and must be borne.

Mortar.

Mortar is better old than quite new; it is a mistake to specify,—"only new mortar is to be used." It is with mortar as with clay for bricks, if clay is used for bricks after having been tempered but a short time, the result is apparent in inferior bricks; they are brittle, and will not stand fire or weather, but if the clay is allowed to lie a long time it consolidates, works together, bonds, and makes tougher and more durable bricks; so if mortar is used while fresh, it is brittle, technically—short, the particles do not bind; but if allowed to stand for some days, the particles work well into one another, the whole becomes tough and clammy; a great essential. When we try mortar, as architects, we like to feel it tough and clammy, but we cannot obtain this so well if we require it fresh. The difference between modern and ancient usage may account for our modern mortar not being so good as that of the ancients: Our mortar is now, as a rule, used fresh; in olden times it was frequently buried for twelve months before using. Mortar, though not used fresh, should be protected, according to the weather, and be kept moist; it is injured if allowed to become so dry as to require remixing.

It seems to me a belief is current that mill-made mortar is necessarily better than hand made. I cannot agree with this notion. We were told last meeting that in the building of concrete houses fine sand separates from the cement, does not bind, and that coarser material is better. We all know this to be the case with cement work, hence we specify gravel; for the same reason sand in mortar will not bind so well with the lime if ground fine in a mill, but it is better for being coarse, while the bonding of the separate ingredients accomplished by the mill is, in hand-made mortar, better secured by capillary attraction when allowed to lie unused for a few days. The ancients or mediæval builders, it is evident, did not use any mortar to correspond with our mill-made; if old buildings are examined, it will be found large particles of the ingredients still exist in the mortar, showing material very much like gravel has been mixed with the lime. Another reason why mill-made mortar does not in practice prove so good as hand-made is, the men at the pug mill will, however they are cautioned, throw in soft broken bricks and other refuse to grind up with the sand, and this refuse will not adhere so well to the lime as sharp sand or gravel. If men merely screen the sand for mortar they cannot adopt this practice. Mortar for pointing is now sometimes buried from force of circumstances: If too much is made the builder buries it, and never finds it worse for such treatment. Mortar for pointing should not have much burnt marble in it, as the burning of the marble destroys its nature. Ground refuse from glass works is now very frequently used for pointing, and with great success.

Smoky Chimneys.

It would be out of place here to attempt to deal with this evil in detail. I will simply allude to one principle only, apart from defective building, and the numerous inventions as remedies. It will invariably be found that chimneys have a tendency to smoke when at the side of a house where no building the same height adjoins. The space at the side of the house being sheltered, forms a vacuum, and as wind passes over the building, it has a tendency to fall down and fill up this vacuum, and in so doing it rushes down the chimneys at that end of the house. This explains why such chimneys smoke during particular winds only. They do not smoke when the wind blows directly against them, but when it comes from an opposite quarter passing over the roof of the house. This, of course, suggests the necessity of making special preparations for all chimneys in such positions. A good curve to the flue will often prove sufficient. Chimneys smoke worse in Gothic houses, because the vacuums created are more numerous. In flat roofed houses, if the chimneys are in the middle of the roof there is not much fear of them smoking.

Masonry.

The frequent failures in the use of Bath stone in and near Liverpool; the utter want, as it has appeared to me, of its adaptability to our clime, has often attracted my attention, and I have tried to find out the reason why a stone of such pleasing appearance and so useful in working could not be more generally used by us. When in Bath, a short time ago, I had an opportunity of paying attention to the subject. I soon came to the conclusion that the cause of failures in the use of this stone in Liverpool exists mainly in applying to the wrong quarries for stone for outside purposes.

If we require a good stone for outside purposes, we should specify "Box Ground," or the "Combe Down" stone. These are the most durable; they work freely, and the former is considered equal to Portland stone in durability, while much cheaper. The Combe Down stone was used in the building of Bath Abbey; nearly 300 years have elapsed since this abbey was restored, and yet many of the mouldings are still perfect. The Combe Down stone is not equal, on the whole, to the Box Ground; for outside purposes it requires to be selected, but when selected gives great satisfaction; the blocks are not so large as those of the Box Ground; its texture is hard and coarse.

The Box Ground is coarser and harder than any of the Bath stones, and while most sorts will go to pieces in frosty weather, this will stand the hardest frost. It may be safely used for any external work, plinths, copings or weatheriugs. Laying Bath stone on its proper bed has a great deal to do with its lasting well. This may always be determined by the thin black veins which run up the bed; they never run in the bed; and in some of the stone there are hard black veins termed lists or ribs; these always run in the bed and never across. The Box Ground stone can be obtained in lengths of 12ft. 6in. or 14ft. 6in.; the blocks vary in size from 4 to 120ft. cube.

The Corsham Down stone is the best to specify for inside purposes. It has a beautiful warm colour, and looks more effective than any other; while the other stones alluded to are very coarse, this is, on the contrary, of very fine texture, but durable and strong. It is free and easy to work, as, indeed, are all the Bath stones. It absorbs a great deal of water, and so in hard frost requires to be covered up, as it would burst if left exposed.

---

*Read before the Liverpool Architectural Society.

It is the most regular in quality of all, and considered the best of our English stones for internal work. Patches of dark blue or slate colour are sometimes found; these portions work in with the rest for ornamental effects in chimney pieces, &c.; the stone is sounder where these patches exist.

Another sort is the Farleigh Down stone, the principal feature of which is that the quarry contains two beds, the red bed and the white bed. This stone does not stand the weather well; it is more easily worked than any of the others, but the appearance is not so pleasing as the Corsham; it dries out often in red patches, giving an appearance termed foxy. It is in great demand in the neighbourhood where quarried, because of its price and easy working, but has no advantages to offer for Liverpool.

(To be concluded next week.)

THE PERPLEXITIES OF BUILDING.

THE guardians of the poor of Islington (says a local journal) have an unenviable handful in their workhouse building at Holloway. From the beginning this undertaking has been a continuous round of perplexities and vexations. Building materials have been complained of, delays have given rise to constant expostulations, the architect (Mr. Burden) and the contractor (Mr. Nutt) have differed intermittently, the one fretful at the tardiness with which his cash advances have been made, and the other hesitating to certify; "extras and omissions" have been imported into the original plan to an extent which has nearly doubled the estimated cost of the building, and, finally, the time at which the building should have been completed and handed over to the guardians has long since passed, and the work is nothing like finished yet. At the meeting of the guardians on Friday last, Mr. Nutt attended and demanded the payment of an advance of £3,000, adding that he had only received £1,000 during the last fourteen weeks, whilst the reserve of £7,000 had been in the guardians' hands for twelve months, and that he would not give up possession of the works until he was paid. This, one of the guardians interpreted as a threat, and hinted that legal proceedings might follow. The contractor asseverates that he is a greatly ill-used man, and that he should have had the work completed long since if he had not been unduly interfered with.

BIRMINGHAM ARCHITECTURAL SOCIETY.

THE Council of the Birmingham Architectural Society invites pupils and assistants, under twenty-five years of age, in the offices of members of the Society, to send in sketches and drawings of interesting buildings, and other architectural subjects, for which they will award the following premiums—namely, five guineas for the best, three guineas for the second best, and two guineas for the third best set of drawings, the merits of which will be determined by the Council of the Society. The subjects for sketching this year are portions of Aston Hall, and the Collegiate Church of Wolverhampton, the selection of which is left to the judgment of the student; the drawings to be plotted to a scale of six feet to one inch, with mouldings and ornamental details one-fourth real size; the sketches and measurements taken upon the spot to accompany the finished drawings; the drawings are to be in pencil, Indian ink, or sepia; the premiated drawings to become the property of the Society, all others will be returned to their authors; the drawings to be distinguished by a motto or device, and a letter containing the author's name, with a similar motto outside, to accompany them, which are to be delivered, free of expense, to the honorary secretary on or before the 1st day of December next. Students wishing to compete must send in their names to the honorary secretary by the 1st day of August, of whom any further information can be obtained.

THE SITE OF THE NEW LAW COURTS.—On Monday, in reply to Mr. W H. Smith, Mr. Ayrton said, as far as he could judge, the excavations for the foundations of the new law courts would be made at such an early period that it would not be practical to make a thoroughfare for the temporary use of the public.

ARCHÆOLOGICAL AND ARCHITECTURAL SOCIETIES.

LINCOLN DIOCESAN ARCHITECTURAL SOCIETY.—The members of this association had a most successful annual meeting on the 16th and 17th ult. at Boston. The proceedings commenced with Divine service at St. Botolph's, Boston, after which a description of the church was given. The churches of S. Leodegar's, Wyberton; S. Mary, Frampton Kirton; SS. Peter and Paul, Algar Kirk; S. Mary's, Sutton; SS. Peter and Paul, Wigtoft; S. Mary and Holy Rood, Donnington; S. Swithin's Becker; and S. Mary's, Swineshead, were then visited. The society's dinner took place in the Assembly Rooms on Friday evening.

SUFFOLK ARCHÆOLOGICAL SOCIETY.—On Thursday, the 24th ult., many of the members of this society, and their friends, paid a visit to several places of interest in the Mildenhall and Isleham district. The excursion was planned by Mr. Dewing, the secretary. Starting from Bury at 9 o'clock, Cavenham, Tuddenham, and Isleham churches, Isleham Priory, Wamhill, and Mildenhall Church, were visited. After inspecting a collection of antiquities, arranged for the occasion in the Working Men's Institute, Mildenhall, the party returned to Bury.

Building Intelligence.

CHURCHES AND CHAPELS.

ASHFORD.—The little village church of Ashford, Derbyshire, has recently (with the exception of the tower) been rebuilt. The old building possessed little architectural or antiquarian interest, and it was, besides, in so dilapidated a condition that reconstruction had become a work of necessity. The Tudor feeling in the old church has been maintained throughout the new work. The roofs are open-timbered, covered with tiles. The walls are of grey limestone, and for the windows, doors, and other parts, yellowish local sandstone is used. Messrs. Medland and Henry Taylor, of Manchester, are the architects, and the contract was taken by Mr. Joseph Brown, of Matlockbridge.

ASHTON.—The foundation stone of a new Wesleyan chapel at Ashton was laid on Saturday week. The building will be Gothic in style, and constructed of Staffordshire blue bricks, with stone dressings. Mr. Richard Oughton is the architect, and the work is to be carried out by local contractors.

GORLESTON.—An effort is about to be made to restore this, one of the finest churches in Suffolk. The false ceilings in the north and south aisles are about to be removed; and the screen at present dividing the north and south aisles is to be taken away.

IDLE.—On Saturday afternoon the foundation stone of a new Wesleyan chapel for Idle was laid by the Mayor of Leeds. The new place of worship will be 76ft. long, 49ft. wide, 32ft. high, and will afford accommodation for 760 persons, having galleries all round. There will be at the back of the chapel a large vestry or class room, besides a minister's vestry. The style is Italian. The design has been prepared by Mr. Samuel Jackson, and was selected from a limited competition. The building is estimated to cost £2600.

KNOWLE.—The foundation stone of the new church of the Nativity, Knowle, near Bridgwater, was laid on Saturday week. The style of architecture adopted is Byzantine, and the principal material employed will be brick, with coloured stone, marble, and tiles worked into the columns of the arches and the floor. There will be a tower 92ft. high at the south west corner, and the building will comprise nave, aisle, and chancel. The nave and chancel will both be 30ft. wide, and the sanctuary will be partially lined with marble; red Aberdeen granite will be used in the columns of the chancel. It is in contemplation to decorate the dome of the sanctuary with a picture of the "Last Judgment," and to have other paintings and freestone bas-reliefs beneath the windows. The ceiling will be decorated in colours. The roof will be covered with Bridgwater tiles, and the spire with green Westmoreland slates. The cost will be £5000. Messrs. Ponton and Gough are the architects, and Mr. W. Brock is the contractor.

LINTZ GREEN.—Last week the foundation stone of a Wesleyan chapel was laid at Black Hall Mill, between Ebchester and Lintz Green, on the Derwent Valley Railway. The edifice will be nearly cruciform, simple in construction, with round headed windows and doorways, and will be erected from plans drawn by Mr. J. Smith, architect, Shotley Bridge.

LYDEARD S. LAWRENCE.—The parish church of Lydeard S. Lawrence, near Taunton, which has been styled "The Cathedral of West Somerset," was reopened on Thursday week after restoration. The church consists of a chancel, nave, tower, north aisle, and north and south porches. The chancel and east window are of the Decorated period, and were built about 1350. In the chancel is a series of sedilia for the clergy, with a piscina of the same period. The nave, of Perpendicular character, was probably built about 1450, or a little later; the north aisle later still. The tower and porches are very fine specimens of Perpendicular work. One of the special glories of the church is its magnificent Perpendicular woodwork, including a rood screen. The restoration was commenced in September last, under the direction of Mr. C. Giles, architect, of Furnival's-inn, London. New open roofs of stained deal, covered with slate, have been constructed; the gallery in front of the west window removed, and the arcade dividing the nave and north aisle, having been thrust out of the upright by the weight of the old roofs, has been taken down and rebuilt. The many coats of limewash which covered the walls of the interior have been removed, and the stone tracery of the windows has been restored. Most of the old carved oak bench ends, and other woodwork, has been preserved and re-used, and new chancel stalls, reading desk, and altar rail provided, as also new reredos of Bath stone. Externally, the masonry has been repaired, but the tower and the two porches remain to be restored. The total cost has been £1400. Mr. S. Shewbrooks, of Taunton, was the contractor employed.

MAIDENHEAD.—The completion of S. Luke's Church, Maidenhead, was consummated on Saturday last by the dedication of the tower. The church is built in the Early English style of architecture, the materials being freestone, from Charlbury, Oxfordshire. The dressing is of Box ground Bath stone on the exterior, and Corsham Down stone in the interior. Mr. G. R. Clarke, of London, is the architect, and Mr. Griffiths, of Eldersfield, Worcester, the builder. The tower and a portion of the nave were not built when the church was consecrated, but the edifice has now been completed. The entire cost has been £3500.

MIDDLESBROUGH.—On Saturday afternoon the foundation stone was laid of S. Paul's Church, Middlesbrough. The church, which is to be an adaptation from the Middle Age Gothic, is designed by Mr. R. J. Johnson, architect, of Newcastle. It is to accommodate 700 persons and will cost about £4000.

REFUSAL TO CONSECRATE A CHURCH.—A new church at West Derby, about three miles from Liverpool, which has just been erected at the expense of a Mrs. Reade, was to have been consecrated last week by the Bishop of Chester. It appears that the walls, roofs, and almost every other part of the church are most artistically decorated and covered with paintings of the Apostles and other personages in Scripture history. The nave is divided from the chancel by a magnificent oak screen, richly painted in gold and colours, while the roof and walls of the chancel are still more elaborately decorated. The altarpiece consists of scenes from the Passion of our Lord, from His betrayal to the visit of the Marys to the Sepulchre. The Bishop, who visited the church a few days since with some of the local clergy, is said to have expressed his strong disapprobation of these decorations as being out of place in such an edifice, more especially the altarpiece. He refuses to consecrate the church until that is removed, as well as several other portions of the decorations. It is stated that the donor of the church declines to permit any of the decorations to be removed, and threatens to resort to measures to enforce the consecration of the church as it is now decorated. The cost of the edifice amounts to £30,000, and it has been erected from designs furnished by Mr. G. F. Bodley, architect, of Harley-street, London.

S. SAVIOUR'S CHURCH FOR THE DEAF AND DUMB.—The foundation stone of a church, unique in its character, will be laid by the Prince of Wales on the 5th inst. The deprivation under which the deaf and dumb labour necessarily excludes them from public instruction by the ordinary oral means, and the only effective way of addressing them, either in sermons or lectures, is by the finger and sign language. The Association in Aid of the Deaf and Dumb provides twelve services and a lecture per week, which are greatly valued by the deaf and dumb. The Association deem it requisite that a proper place of meeting dedicated to Divine worship should be provided. The Marquis of Westminster has given a site at the corner of Queen-street, Grosvenor-square, the frontage being in Oxford-street, and the Committee have now about £3000 in hand, including £50 from the Queen. The estimated expense is not less than £5000, for which sum, besides the church, there will be provided a large room for lectures, evening classes, reading and recreation. The contemplated residence for the chaplain will involve an additional outlay.

THE CHURCH OF ALL SAINTS, SURREY SQUARE.—This new church was consecrated on Monday by the Bishop of London. The former church was destroyed by fire in April, 1869, and a new and greatly improved structure has now been erected in its place. Through liberal donations a tower and spire of 116ft, and containing a fine deep-toned bell, have been added. The vestry has also been enlarged, and a powerful organ by Messrs. Bevington and Sons erected. The church is in the Decorated Gothic style, and consists of a nave, north and south aisles, chancel (with side aisles for organ and vestry), and the tower and spire at the north-western end of the nave. Free sittings are provided for 800 persons. The builder is Mr. W. Downs, Southwark; and the architect is Mr. R. Parris, of Kennington-road, Lambeth. The restoration of the church has cost £4900.

BUILDINGS.

BOLTON.—The works in progress for the new Town Hall, Bolton, were inspected by the committee last week. The very slow progress which is at present being made was matter of comment, and the architects, Messrs. Hill and Woodhouse, were directed to adopt means of compelling the contractor to complete the works within the stipulated period.

KIDDERMINSTER.—The Countess of Dudley laid the foundation stone of the new Kidderminster Infirmary on Tuesday. The architect is Mr. J. G. Bland, of Birmingham, and the builders, Messrs. Binnian and Sons, of Kidderminster. The contract is about £7000, and another £1000 is required for furniture, &c., in addition to £1000 for site.

THE NEW MANSION HOUSE STATION.—The directors of the Metropolitan District Railway, at their Board meeting on Tuesday, decided to adopt the plans and recommendations of their engineer, Mr. Fowler, for their city station. The station will be at the junction of Queen Victoria-street and Cannon-street, with the entrance at the corner of Cannon-street, and in view of the Mansion-house and the Royal Exchange. The contractors will commence the work forthwith, and it is anticipated that the station (which will be called Mansion-house Station) will be completed and opened for traffic in the beginning of next year. It is intended on the opening of this station to run trains in each direction at least every three minutes.

WHITECHAPEL.—New schools for the children of seamen and others, in connection with St. Paul's, Dock-street, Whitechapel, were opened yesterday (Thursday) by the Prince and Princess of Wales. The new buildings consist of schools for an average of 600 children, viz., 150 boys, 150 girls, and 300 infants, with residences for master and mistresses. There is a covered recreation ground for the children. The schools are from a design by Messrs. Greatorex and Co., architects, and the lowest of nine tenders was accepted (that of Mr. Thomas Ennor) for £4890.

Correspondence.

PATENT VICTORIA STONE.

(To the Editor of THE BUILDING NEWS.)

SIR,—In reply to the letter which appeared in THE BUILDING NEWS of last week, I beg to say that Mr. Trickett is too well acquainted with stone not to know that its durability and value do not depend on its thickness. When our paving was first laid down in the Poultry Mr. Trickett prophesied that he would be called upon to take it up and lay down Yorkshire stone in its place within a month; but now from 10,000,000 to 12,000,000 persons have walked over it, and I think any impartial person will say it has worn better than the picked specimen of Yorkshire stone which was laid down at the time to compare with it.

Mr. Trickett says it will be expensive to take up our stone for repairing water-pipes, gas-pipes, &c., but if he made due inquiry he would find that it can be taken up and relaid as easily as York or any other stone; and he altogether overlooks the fact that as we can cast our stone easily in any form, nothing would be easier than to make it in the shape of an inverted trough, to lay over gas-pipes, water-pipes, telegraph wires, &c., and that it would only be necessary to take up the single channel prepared for this purpose, without any disturbance to the rest of the pavement. Let him tell us what Yorkshire channels thus formed would cost.

I will conclude by giving Mr. Trickett two challenges:—1. Mr. Trickett shall find a slab of Yorkshire stone, and we will find a piece of our stone; they shall be rubbed against one another for 24 hours, and the thickness worn off each at the end of that time shall be measured. 2. We will produce a beam of stone made in accordance with our patents of any dimensions, and Mr. Trickett shall produce a piece of Yorkshire of the same dimensions, and we will guarantee our stone to bear at least double the weight of his.—I am, Sir, &c. (for the Victoria Stone Company),

THE MANAGER.

DECORATION AND IMITATION.

SIR,—I cannot but admire the admirable skill with which your correspondent "J, R. W." winds and twists and fences with the questions at issue. He has undertaken an impossible task—namely, to prove that inconsistency is consistent, and that John Ruskin, in saying one thing, means another, which latter I for one do not believe. However, with this part of his letter I can have nothing to do, but must refer the reader to the text, and leave him to judge.

In the last paragraph he asks what I mean by the legitimate in decoration, and supposes that I mean legitimate as a synonym for the word beautiful. Now "J. R. W." knows as well as I do that I did not mean anything of the sort, nor would any man of average intelligence interpret the sentence so. What I do mean is that all materials and processes used and recognised by precedent and practice as being aids to decorative art become legitimate thereby: for instance, scaglioli is an imitation of marble universally acknowledged, admitted, and used by architects as a legitimate substitute for marble; consequently it is a legitimate aid to decorative art. It is in this sense, and this only, that I used the word legitimate.—I am, Sir, yours, &c., W. S.

COMPETITIONS.

SIR,—Competitions are not very plentiful just now, but of the few there are, I think two deserve notice.

A premium of £25 is offered by the Burial Board of Guisbrough for designs for laying out land for a cemetery, and for the various buildings required. No instructions are issued, and a sum of 5s. is asked for the plan of site, so that if the applications are numerous, the competitors will pay some of the premium, and render the competition a kind of architectural sweepstake. This is probably novel to most of your readers.

Another competition—that for laying out the Camberwell Charity Estate—has just escaped becoming a disgrace to the Vestry, through the energy of a few members who stood up for justice, feeling that if it was intended from the first to give the premium to the surveyor to the charity, why have asked for designs, and why have allowed the surveyor to compete?

The decision has been referred to an independent member of the profession, Mr. Pownall; but still some of the vestrymen will try to do all they can for their first and only love by sending with the surveyor's competition drawings the plans and reports prepared by him months before the competition.

Should Mr. Pownall select any design other than No. 4 (well known from the first to be the surveyor's) then I quite expect the premium will be paid to the author of that design, and the carrying out of the work will be entrusted to the charity surveyor in a similar way to the Walworth Common Estate competition, two years since.—I am, Sir, yours, &c., JUSTICE.

Intercommunication.

QUESTIONS.

[1883.]—STRENGTH OF GIRDERS.—Can any of your readers who are up in calculating strength of girders, &c., tell me if it is usual in using Hurst's rules, to take $1\frac{1}{2}$ W, as is there stated, for beams fixed at both ends, when calculating strength of girders in ordinary floors, and whether in using girders with iron flitch, this rule of adding $\frac{1}{2}$ W is to be used, as I observe that the use of the flitch adds 30 T to the first rule, but alters the constant from 3 to 2·5, so that the one girder without the flitch would work out, adding the $\frac{1}{2}$ W for fixing, quite as strong as the one with a flitch?—PUZZLED.

[1884.]—CONVENTS.—Would any of your readers kindly give me a little information respecting convents, their arrangments, &c.? I wish more particularly for particulars for convent according to Anglican Church.—A. L.

[1885.]—BALL ROOMS.—Can anyone tell me what is the usual space allowed for each person in a large ball room?—L. B.

[1886.]—YELLOW LIGHT.—I wish to reduce the white light coming through ordinary glass windows into a large interior, and at same time to obtain yellow light. Understanding that both objects can be obtained by a slight wash of colour, I should be obliged if some of your readers could inform me which paints are applicable for the purpose, and the proper method of application?—A. B. C.

[1887.]—COLOURING TILES.—How can I colour red roofing tiles, after they have been burnt, so as to give them a dark brown or blue colour, and to so fix the colour permanently, that it will not be affected by the rain?—A SUBSCRIBER.

[1888.]—POLISHING PEBBLES.—Can any one inform me how to cut and polish pebbles?—W. SMITH.

[1889.]—ARCHITECTS' VOLUNTARY EXAMINATION,—Could any of your readers tell me if copies of the papers for the last examination are obtainable, and whom from?—PUPIL.

[Write to the Secretary of the Institute, 9, Conduit-street, W.]

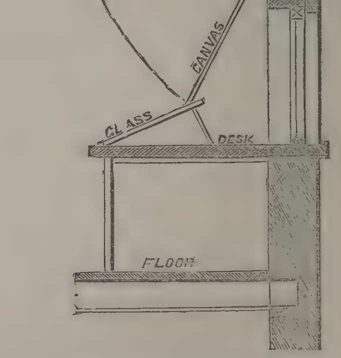
REPLIES.

[1871.]—ARCHITECTS' CHARGES.—The architect in this case has made a very wrong statement in saying that it is a usual and recognised practice in London for architects to receive a commission from the contractors as well as the usual commission from the employer. It may be positively contradicted, and if the architect persist in it he should be called upon for proof of what he states. Would the employer publish the name of the architect?—G. S. B.

[1874.]—GLASS DRAWING BOARD (?) FRAME.—The apparatus alluded to consists of a wood frame, about the size of a large drawing board, containing a panel of glass British plate preferred, as in Fig. 1. This is fixed in a slop,

FIG. 1

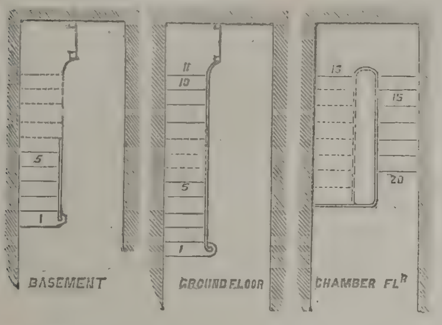
FIG. 2



ing position before a window, a similar frame, covered with canvas or paper, being lowered thereon for the purpose of throwing all available light beneath the glass, as in Fig. 2. The drawing to be copied is pinned to the wood frame, with a sheet of clean paper over it in the time-honoured manner As may be readily imagined, the thinnest paper must be used; and it is only possible to copy full size or large scale drawings by this method.—F.

* * *

[1876.]—PLAN ARRANGEMENT OF STAIRS.—Of the multifarious methods in vogue, the appended is, in my opinion, most explicit:—The strong lines indicate the commencement and termination of the flights upon the level or floor in question, and should be coloured so far as the strong lines extend. Steps overhead should never be dotted on a ground plan, more especially if they are over a gangway: the tendency being to mistake them for steps on the ground floor level.—F.



◆

STAINED GLASS.

Conicliffe.—The east window of Coniscliffe Church has just been filled with stained glass. The window is Early English in style, and it is divided into three compartments. In the central one is represented the Crucifixion, with S, Mary and S. John standing at either side of the Cross; in a space beneath is depicted the Last Supper; and the subjects in the side openings are the Agony in the Garden, the Betrayal, Scourging, Entombment, Resurrection, and Ascension. The ground work is grisaille, on the best antique glass. The window has been designed and executed by Mr. Baguley, of Newcastle, who has also executed a new painted reredos for the church.

Hinton S. Mary.—The east window of the parish church of Hinton S. Mary, Dorsetshire, has just been filled with stained glass by Messrs. Clayton and Bell, as a memorial of the late Vicar, the Rev. C. J. Nicholl, The central subject is the Crucifixion, with the Virgin Mary on one side and S. John on the other.

The Lickey Memorial Window.—A very handsome memorial window has been erected by the parishioners in Holy Trinity Church, to the memory of the late Baroness Windsor, who died on the 9th of November last. The window is a three-light one, erected over the altar, the subjects being Faith, Hope. and Charity, represented by emblematical figures. It also bears the sacred monogram, the Alpha and Omega, the arms of the deceased lady, and other appropriate devices. It has been supplied by Mr. Camm, of Smethwick, late principal designer to Messrs. Chance.

An Ancient Window.—The stained glass window, purchased from the prior of Furness Abbey, at the dissolution of the monasteries, and removed to the parish church, Windermere, 335 years ago, has been removed to London. It is to be restored, from the drawings of similar windows in the Bodlein Library, provided that funds can be raised for the purpose.

◆

LEGAL.

Alleged Slander.—Chatterton v Nelson—The plaintiff in this case was the lessee of Drury Lane Theatre, and the defendant, Mr. Marsh Nelson, was the architect and surveyor to that establishment, The action was to recover damages for slander. The case for the plaintiff was that in June, 1869, a Mr. Robinson had a contract to redecorate the theatre for the sum of £3210; and in reference to it he saw the defendant, who made statements to the effect that if Mr. Robinson did the work he would probably lose his money, and that it was likely that a Chancery suit would be commenced against the plaintiff and he would be turned out of possession. At the conclusion of the opening speech a consultation took place between the counsel. Mr. Hawkins said that what Mr. Nelson said had been entirely misunderstood, that he never made any imputation whatever upon Mr. Chatterton, and that there was not the slightest ground for any imputation. Mr. Nelson was desirous that the friendly relations that had formerly existed between him and Mr. Chatterton should be resumed, and it had been arranged that the matter should be referred to a gentleman who should have absolute power to direct how the litigation should be terminated. His Lordship subsequently saw the counsel in his private room, and on his return said that he trusted that everybody was perfectly satisfied that there was no imputation of any kind resting upon Mr. Chatterton, but there were certain legal difficulties in the way of the plaintiff, and therefore it had been arranged that a juror should be withdrawn. The Solicitor-General said that having regard to the legal difficulties which had been referred to, he would consent to the terms that had been mentioned. A juror was then withdrawn.

Repair of Public Bridges.—The Highway Act, 1835, (5 and 6 Will. IV., c. 50), enacts that "highways" shall be understood to mean all roads, bridges (not being county bridges), &c., and in subsequent sections provides for the repair of highways in a manner therein specified, not at the expense of the hundred in which they are situate. It has been held by the Court of Crown Cases Reserved (says a legal correspondent), in the case of "The Queen *v.* The Inhabitants of Chart and Longbridge," that "county bridges" in section 5 includes public bridges, and that a public bridge which has from time immemorial been repaired by a hundred is, since the Highway Act, 1835, still repairable by the hundred.

Unpaid Vendor of Land to a Railway Company.—A vendor of land to a railway company whose purchase money is unpaid is entitled (says a legal correspendent), like any ordinary vendor, to have his lien enforced by a sale of the land, but he is not entitled to an injunction to restrain the company until sale from making use of the land which he had sold to them. Vice Chancellor James having granted such an injunction in the case of Munns v. The Isle of Wight Railway Company, his order was discharged on appeal; but a receiver was appointed, and the Company was directed to let him into immediate possession of the land.

Architects and Minors.—The case of Wallis *v.* Kemp, heard at the Westminster County Court on Tuesday week was one of some interest to the architectural profession. The plaintiff, Mr. G. W. Wallis, of Lincoln's-Inn-Fields, is an architect and surveyor, and he sought to recover £40, being the usual charge for preparing specifications and taking out quantities (viz., 2½ per cent. on the cost of the buildings) of two villas, the cost of which was to be £1600. The defendant was Mr. A. C. Kemp. From the statements of counsel it appeared that there had been a previous action, when it was alleged the wrong party (Mr. E. O Kemp, a brother of the present defendant, and a minor) was sued, and pleaded infancy. It appeared that the plaintiff received the following letter on the 8th of July, 1868:—"22, St. Swithin's-lane, July 8, 1868.—Dear Sir,—Would you have the kindness to favour us with a call to-morrow before 1 o'clock, as we have some business we may possibly place in your hands.—Kemp Brothers." In response to that letter the plaintiff went to 22, S. Swithin's-lane, and saw the present defendant, who produced the plans and drawings of two villas, and engaged with plaintiff to get out quantities and prepare a specification. On subsequent occasions the present defendant, A. C. Kemp, called at Mr. Wallis's office in Lincoln's-Inn-Fields, and asked "How is *my* work getting on?" and, finally, he called at Mr. Wallis's office, and received a bill of quantities and specification. In explanation of how it happened that the wrong party was sued in the original action it was stated on behalf of the plaintiff that he had received several letters signed E. O. Kemp during the time the work was in progress, and came to the erroneous conclusion that the writer of the letters (E. O. Kemp) and the party whom he saw at S. Swithin's-lane, and who called upon him—viz., Mr. A. C. Kemp, were one and the same person. On Mr. Wallis sending in his account it was repudiated by a letter signed E. O. Kemp, it being alleged in the letter that the plaintiff had agreed for only 1 per cent. on the outlay in case the buildings were erected, or a fee of 5 guineas in case they were not. Mr. E. O. Kemp was then sued in this court, and pleaded infancy. The plea being successful, the plaintiff was nonsuited. The present action was then commenced. After Mr. W. M. Taylor, an architect and surveyor, had been called in support of the reasonableness of the charge of 2½ per cent. for such work, and, to show that it was the customary charge in the profession, Mr. Wallis was sworn, and deposed to the present defendant, A. C, Kemp, being the person whom he saw at St. Swithin's-lane, and who gave him the plans and drawings to aid in drawing up a specification. Mr. Wallis also swore to the defendant A. C. Kemp as calling at his office "to see how *my* work is getting on." Joseph Connor, a youth in the office of the plaintiff, and Mr. Guy, formerly a clerk of the plaintiff's, also proved that A. C. Kemp was the person who called at Mr. Wallis's office, and the latter witness proved that the same person called at the office and received the bill of quantities and the specification for which payment was now sought. The defendant, upon being put into the box, admitted having written the letter before quoted and signed "Kemp, Brothers," but swore positively that he did not see Mr. Wallis at St. Swithin's-lane, nor give him the drawings as stated that he did not call, as alleged, at the office of the plaintiff; and that the villas in question were no affair of his, but they were a private matter of his brother's (E. O. Kemp). The counsel for the defendant rested his case on the fact that all the letters from the plaintiff were addressed "E. O. Kemp," that all letters to the plaintiff, with the exception of the first, were signed "E. O. Kemp," and that the account was made out to "Mr. Edward Kemp." It was contended that the plaintiff had virtually given up his case in his letters to the present defendant and another brother (Mr. Fredk. Kemp) after he was nonsuited in the case of Wallis *v.* E. O. Kemp. The following extracts from letters from the plaintiff to the present defendant subsequent to the first action were read:—"There is one thing I wish to make you acquainted with, that is, your brother, E. O. Kemp, instructed me to prepare some work, and gets out of the payment by being an infant at the time:" and "Through your brother being an infant I have lost my claim." Upon this evidence the learned judge nonsuited the plaintiff with costs.'

Ancient Lights,—Barrett v. City of London Real Property Company (Limited).—This was a motion in the Rolls Court to restrain the defendants, who are carrying on extensive building operations in Mark-lane, from breaking into or cutting away the walls of the plaintiff's premises, Nos. 12 and 13, Mark-lane, where he carries on the business of a printer, or using the same as a party wall in the erection of their buildings, as well as from building any chimney, as it was alleged the defendants were doing, so as to darken or impede the light or air heretofore coming to the windows of the plaintiff's premises. The Master of the Rolls made an order restraining the defendants from building the chimney complained of, and directed the rest of the motion to stand to the hearing of the cause.

◆

The Darlington Exhibition.—The collection of the productions of art and science, now being exhibited in the Mechanics' Hall Darlington, is valuable and extensive. The objects which claim and receive chief attention are the paintings, which, though not properly a legitimate element in the collection, are additions and attractions which the committee secured. Among the results of the labours of skilled mechanics are an oak and elm Gothic sideboard, and other articles of furniture worth exhibition; specimens of graining and panelling; an electro-magnetic apparatus for working the block system on a railway; a model of a revolving fort; McDermid's patent paper-hanging machine, &c. The opening ceremony took place under the presidency of the Mayor of Darlington.

Our Office Table.

Civil and Mechanical Engineers' Society.—The annual general meeting of the members of this society was held on the 22nd ult., when after votes of thanks had been passed to the retiring president, W. Forsyth Black, and the other out-going officers, the following were elected on the Council for the year 1870-71., President; James B. Walton, Assoc. Inst., C. E. vice-presidents; C. J. Crosbie Dawson, Assoc Inst., C. E., Frederick E. Cooper. Council; R. M. Bancroft, H. E. Hunt, Frederick A. Klein, A. H. Lavers, William Meakin, Arthur Tyrrell, Arthur T. Walmisley. Hon. treasurer, Arthur C. Pain, Assoc. Inst. C.E. Hon. secretary, Charles H. Rew. Hon. accountant, J. Wagstaff Blundell. The past presidents, W. Forsyth Black, Benjamin Haughton, G. Eedes Eachus, Assoc. Inst. C.E., and William Maw, are *ex officio* members of the council.

Metropolitan Board of Works.—The following is the estimate of the expenditure of this Board for the year ending at Lady Day. 1871:—1. General working expenses, provided for by the consolidated rate, £432,546—namely, £307,632 for interest and repayment of principal of securities granted before the passing of the Consolidated Stock Act of last Session, and £124,914 for sewerage and drainage, maintenance of parks, expenses under Acts relating to petroleum, dangerous structures, Fire Brigade, contagious diseases of animals, building, &c. 2. Amount payable out of the Consolidated Loans Fund, for interest and principal, £164,599. 3. Amount to be expended on metropolitan improvements, &c., £897,000, viz., Stingo-lane improvement, £50,000; main drainage and main sewers, £497,000; Park-lane improvement, £123,000; Chelsea Embankment, £135,000; contributions to minor improvements, and for completion of Finsbury and Southwark Parks, and Whitechapel and Kensington improvements, £77,000; Fire Brigade (capital account), £15,000.—Grand total, £1,494,145.

Dwellings for the Working Classes at King's Cross.—It is intended to convert the King's Cross Market, in the Old S. Pancras-road, into dwellings for the working classes of the neighbourhood, where, owing to the great destruction of house property for the making of the new Midland railway station, such erections are greatly needed. The plans show that the greatest care has been taken to secure every domestic and sanitary requisite. There will be two hundred tenements, each complete in itself.

Building on the Thames Embankment.—Mr. W. H. Smith, the member for Westminster, has given notice of motion in the House of Commons that an address be presented to her Majesty, praying that no buildings may be placed upon the land reclaimed by the making of the Thames Embankment. It will naturally be surmised (says the *Post*) that Mr. Smith would not have taken this step had he not been made aware of the existence of some design for building upon this land. Such a surmise would have a substantial foundation of fact to rest upon. The design of erecting some of the proposed new Public offices close to the Embankment has been seriously entertained. More than that, the exact site has been selected, and the plans for the buildings are actually being drawn. In fact, it has been decided to build a new Admiralty and a new War Office on the reclaimed land between Whitehall-place, Whitehall-yard, and the Embankment. Either on the score of public convenience, æsthetic feeling, metropolitan improvement, or the ratepayers' rights—virtual, if not strictly legal—the sudden resolution of the First Commissioner of Works to build upon the land reclaimed from the Thames should be resisted. Better far that the concentration of the public offices should stand over until we are in a position to approach our great pending architectural questions in a becoming spirit than that we should undertake the work with the sole idea of providing so many cubic feet of buildings in the cheapest possible manner.

Certifying for "Extras."—At a special meeting of the Shrewsbury Town Council the other day, the certificate of the architect of the new markets, Mr. Griffiths, was put in, and the Council were asked to pay the balance of £8321 due to the contractor. Mr. Griffiths had been requested to supply particulars of the account, but had declined, on the ground that it was against the custom of the profession.

As the "extras" amounted to the enormous sum of £11,846, some members of the Council thought it rather hard that the bill should be passed in the dark, and a proposal was made to accept Mr. Griffiths' offer of measurement; but eventually the clerk was instructed to raise the necessary money and discharge the debt.

THE ROYAL ENGINEERS.—The numerical strength of the officers of Royal Engineers is (according to the *Post*) to be considerably increased, in view mainly of the urgent prospective requirements of the Public Works Department of India. The precise mode of carrying out the augmentation must depend upon the recommendations of Captain Vivian's committee on the promotion in the scientific corps. In all probability the additions to the Royal Engineers will be made gradually, rank by rank, from the lowest commissioned grade upwards.

SOIREE AT THE ROYAL ACADEMY. — The Royal Academy of Arts gave a soirêe on Tuesday evening in their galleries at Burlington House, Piccadilly, which was most numerously and fashionably attended. The picture galleries were thrown open about half-past nine, and the enjoyment of the evening was much enhanced by the performance of music. Refreshments of a light character were furnished to the visitors in several of the rooms.

REFUSING HONOURS. — Mr. Courbet, the French painter, has written a long letter to M. Maurice Richard, Minister of the Fine Arts, refusing the Cross of the Legion of Honour conferred on him on the occasion of the late Paris Exhibition. He grounds his decision, first, on the fact of his being a Republican, and therefore not willing to accept any favour or mark of honour from a person on a throne; and next because it is the public alone that can properly reward the merits of an artist.

PROPOSED SHIP CANAL AT CAPE COD.—A number of Boston (U.S.) capitalists have organised a company to construct a ship canal across Cape Cod, at a cost of about 8,000,000dols., and have applied to Congress for an appropriation of 2,000,000dols. to construct a breakwater to protect the entrance to it. The scheme is an old one, it having been advocated as long ago as the time of Miles Standish. United States' engineers have recently investigated the proposed plan, and have reported favourably upon it.

WORKMEN'S DINNER.—The employés of Messrs. Morant, Boyd, and Blandford, decorators, &c., 91, New Bond-street, had their annual dinner at the Crown Hotel, Broxbourne, on Saturday last, upon which occasion the principals of the firm were present. Mr. Morant presided. After dinner the sports and pastimes commenced. Not the least attractive one was a handicap foot-race of 100 yards, for two silver cups, to be awarded to the two best men contending in a grand heat. There were about 70 subscribers of 1s. each, which sum was supplemented by 10s. subscribed by Mr. Morant. There were 60 entries, and these were divided into eight divisions, the best man of each to be eligible to contest the grand heat. That heat resulted in a dead heat between Messrs. Keteyroo, jun., artist, and Fairbanks, cabinet-maker, which, on being ran over again, Keteyroo was declared the winner, through Fairbank's having crossed his opponent's path. The judges were Messrs. Boyd and Blandford, and the handicaper Wm. Carpenter, whose assiduity deserves especial mention. After a well-spent day, all returned to town, highly delighted with their day's outing.

STEAM ROAD ROLLER.—The large gold medal was awarded to Messrs. Aveling and Porter, for their 15 ton steam road roller at the exhibition of machinery held last week at Lille.

Chips.

A plan for a system of tramways in the streets of Calcutta has been submittted to the Indian Government. The estimated cost is £1000 per mile,

A new public park and gymnasium, at Ashton-under-Lyne, presented to the town by Mr. Hugh Mason, was opened on Saturday last.

Mr. Samuel Hall, of Battle, has given £500 towards the new buildings for the Coventry School of Art.

Negotiations have been completed for the erection of a lighthouse on Hartland Point, in the Bristol Channel.

Mr. J. H. Smith, architect, of Trinity, Taunton, has been elected surveyor to the Local Board of Health in that town. There were 34 applicants for the office, but Mr. Smith received the almost unanimous support of the boacd.

Kent House, so long the residence of the Duke of Kent (father of tne Queen), and subsequently of Lord Clarendon and Sir Cornewall Lewis, is being pulled down.

A new market is about to be erected at Whitchurch, Salop.

Mr. Speakman, architect, of Manchester, has been commissioned to prepare the plans for the alterations proposed to be made in S. John's Church, Atherton.

A new Catholic church, dedicated to S. Mary Magdalene, was opened at Seaham Harbour on Thursday week.

Mr. John Wilson, of Blackburn, has been appointed surveyor to the Bacup Local Board, at an annuul salary of £120. There were twenty-five candidates.

It is proposed to erect a new workhouse for Burnley, to accommodate 350 inmates, at a cost of £15,000.

The Woolwich Board of Guardians have decided upon the erection of a new parochial dispensary and relief offices in King-street, from plans by Messrs. Church and Rickwood.

Mr. James Lund, of Sheerness, has been appointed to the Surveyorship of Worthing.

The foundation stone of a new hall for the Coachmakers' Company, in Noble-street, Gresham-street, was laid recently by the Master, the old hall having been pulled down and part of the site appropriated to the erection of warehouses.

High Holborn will be closed for carriage traffic from the 4th to the 30th inst. (both days inclusive), for the purpose of being repaved.

The improvements at Hoxton (mentioned in last week's BUILDING NEWS, p. 483), will be carried out, the Shoreditch vestry having decided to widen the streets mentioned, and to pay £4415 10s. to Sir J. T. Tyrrell for the land.

Mr. Bridgman has been appointed assistant-surveyor to the S. Pancras Committee of Works.

The "Presse" states that the French Cabinet have decided so raise the loan of the City of Paris to 680,000,000 francs, in order to continue the public works commenced under the administration of M. Haussman. For a time, therefore, the troubles of the Parisian builders are averted.

Timber Trade Review.

At Messrs. Churchhill and Sims' sale on Wednesday, the following goods were offered :—

20,000	Spruce deals, &c.
37,000	Quebec pine deals, &c.
73,000	Swedish deals and battens.
93,000	Norway deals and battens.
11,000	Finland deals and battens.
4600	Riga deals.
160,000	Prepared flooring and match boards.
5600	Fresh Norway spars and poles.
2000	Dantzic deck deals.
100	Riga wainscot logs.
200	Fathoms lathwood.
100	Loads Norway balks.
70	Loads Stettin oak timber.
50	Loads Quebec birch.
2800	Loads Dantzic fir timber.
119,000	Feet Norway and Swedish mouldings.
	&c., &c.

The prices obtained for which were as under :—

Trade News,

WAGES MOVEMENT.

THE BRADFORD CARPENTERS AND JOINERS.—On Friday last a meeting of the journeymen in these trades was held in the Seeular Hall, Southgate, Bradford, to take into consideration the position of affairs in regard to the advance of ½d. per hour conceded by the board of arbitration, and which was to come into operation on the 1st of March last by joint agreement between the employers and employed. Some of the masters had paid the advance, others had not, others again were paying 1s. a week extra, and some who had at first kept the agreement were not doing so now because it was not a general thing in the trade. A correspondence was read that had passed between the committee of the operatives and the secretary of the masters' association, and it was stated it had been agreed to meet the employers who had paid the advance. Three resolutions were passed—one pledging the operatives to render moral and pecuniary support to the committee to carry the matter to a successful issue; the second specified that if an amicable arrangement could not be arrived at by the 1st of July, and the advance be paid, work should cease in those shops where the advance was not paid until the decision of the board was carried into effect: the third was that if an agreement could not be come to on Monday, the men should cease to work in the shops which did not give the advance on the following Saturday. The speeches throughout were of a temperate character, regret was expressed that the employers generally did not carry out the decision of the board, and to show the prosperous state of the trade, it was stated that the Amalgamated Society of Carpenters and Joiners in Yorkshire numbered 23 branches and 1502 men. In March last 300 men were out of work, but now only seven men were in need of employment. In Lancashire there are 27 branches and 1491 members, of whom, in March last, 500 men were seeking work, while now there were only 15. In the United Kingdom, and inclusive of two societies in America, there were 239 branches and 9828 members. Of this number 900 men wanted employment in March, but the number had sunk to 192, being 100 less than in the preceding month. Under these prosperous circumstances the men found themselves in a good position, and while being willing to do all in their power to avert a strike, by meeting the employers, they expressed their strong determination to enforce the decision of the board, even if they had to adopt the painful alternative of a strike.

THE BUILDING NEWS.

LONDON, FRIDAY, JULY 8, 1870.

THE LONDON CORN EXCHANGE COMPETITION.

In consequence of the insufficient accomodation afforded, by what is called the Old Corn Exchange,* Mark-lane (to distinguish it from the *annexe* or *succursale* on the north side, erected in 1827, and called the New Corn Exchange), a committee of proprietors appointed for that purpose last year, requested Mr. I'Anson, and Mr. William Haywood to survey the Exchange, and the buildings in connextion with it, and to report to the committee as to the most desirable mode of increasing the accommodation for the business of the market, and remedying the inconvenience resulting from the present defective system of ventilation. These gentlemen made a joint report, in which they stated that their observations and inquiries led them to the conviction that it would be impolitic to attempt any extension or partial improvement of the existing Exchange, and recommended the entire removal of the buildings on the ground floor, and the construction of a new Exchange covered by a glazed roof at a higher elevation than the present, in one span. They also recommend the formation of a Flour market on the first floor, next Mark-lane, an Oil and Seed market on the ground floor at the south-east angle of the Exchange premises, together with other recommendations of minor importance.

This report having been taken into consideration by the committee, and reported to the general body of shareholders, it was resolved to carry into effect the recommendations of the report, and for that purpose it was determined to invite a limited number of architects to submit designs for rebuilding the Corn Exchange, according to Messrs. I'Anson's and Haywood's suggestions. By the terms of the conditions under which the architects were invited, the competitor whose design is selected for execution will be entrusted with the preparation of the drawings and the superintendence of the work, at the usual commission, and premiums of 200 guineas and 150 guineas respectively, are to be given to the two designs considered next in order of merit. The amount for carrying out the work is not to exceed £20,000, exclusive of architect's commission, and clerk of works' salary.

In reply to the invitations of the committee, 17 architects agreed tó compete, but of these 13 only sent in designs, which are now placed in a range of upper rooms of Corn Exchange Chambers, Seething-lane. These designs are, as might have been expected, of varying merit, but although there is, perhaps, no single design that could be adopted in its entirety, there are strong evidences in most of careful study of the requirements of the case, combined, in at least two instances, with artistic excellence of the highest order. The problem to be solved is very much complicated by the necessity of avoiding obstruction to the light and air of buildings on three out of four sides of the Exchange. These difficulties have been very fairly met in most of the designs, but it unfortunately happens that those designs in which the rights of light of adjoining owners are best respected, have but little to recommend them on the ground of originality of conception or artistic treatment. These designs are all timid and "safe" in their general features, and there is a painful evidence of a desire on the part of their authors to conciliate the prejudices of the committee and to avoid anything untried or novel in construction. It is worth noticing that only one design out of the thirteen sent in is entirely Gothic, and that of a very poor sort: the external elevation of another is treated in the style of the French country houses of the 16th century, but the interior is pure Renaissance, and one is decidedly Romanesque.

By the instruction of the committee, the drawings were sent in under a motto or device, but, inasmuch as the names of the competitors were well known, it is not very difficult to assign the designs sent in, with more or less certainty, to their respective authors, and it is difficult to say why this restriction should have been imposed upon the competitors.

The following is the list of the drawings submitted, with their mottos. The alphabetical arrangement has been adopted by the committee for convenience of reference.—

Plan A, Seges. Palladian.
Plan B, A Wheatsheaf. Palladian.
Plan C, Veritas. Nondescript.
Plan D, Honestas. Free Italian.
Plan E, Iron Framed. Pseudo-Gothic.
Plan F, L'Etoile.
Plan G, Au bon Droit. Palladian.
Plan H, Omne tulit punctum qui miscuit utile dulci. French Renaissance.
Plan I, Progress. French Renaissance.
Plan K, A Maltese Cross. Commonplace Italian.
Plan L, All's Well that Ends Well. Romanesque.
Plan M, Light. Palladian.
Plan N, Three Wheatears. Ditto.

In order to estimate the difficulties to be overcome, and the manner in which they have been dealt with by the several competitors, it will be useful to give some account of the site of the proposed New Exchange, and the surrounding buildings. The present Corn Exchange is an irregular parallelogram about 84ft. by 65ft. with a frontage to the West on Mark-lane, and extending back eastward to a range of offices in the rear of a building called Corn Exchange Chambers, Seething-lane. The range of offices referred to is proposed to be removed, and the new market would therefore be bounded on the west by Mark-lane, and on the east by Corn Exchange Chambers, the lights of which it is important to preserve, the ground floor being used as a subscription room in connection with the Corn Exchange, and the upper floors let out as offices. On the north the proposed Exchange abuts upon the New Corn Exchange, a low building lighted by skylights, the wall dividing the two buildings being only 25ft. 6in. high, at the highest part, and on the South upon lofty buildings belonging to other owners, with an area towards the west end which it is important not to interfere with. The most important objects to be attained are the substitution of a lofty roof to replace the present low roof, which is only about 18ft. high, exclusive of the domes—without interfering with the light and air of adjacent premises, nor the vaults beneath the area of the Exchange, which are let upon lease for a long term—the rectification of the irregularity of the boundary on the north side, without loss of space to the market, and the proper warming and ventilation of the building.

Setting aside some differences in detail, the designs may be broadly divided into five classes, according to the mode in which they propose to accomplish the roofing of the Exchange, and having first arranged them under their separate heads, we will then proceed to examine them further in detail.

Class 1.—Glazed single span roof carried on iron columns.

B. A Wheatsheaf.
C. Veritas.
D. Honestas.
E. Iron Framed.
F. L'Etoile.
M. Light.

Class 2.—Ditto without iron columns.

I. Progress.
K. Maltese Cross
N. Three Wheatears.

Class 3.—Glazed single span roof on iron columns, with aisle on north side.

A. Seges.
L. All's Well That ends Well.

Class 4.—Glazed roof with central nave and 2 side aisles.

G. Au bon Droit.

Class 5.—Domed roof, upper part glazed.

H. Omne tulit punctum qui miscuit utile dulci.

From the above analysis it will be seen that 5 out of the 13 competitors have adopted the expedient of carrying the roof upon iron columns, in order at the same time to avoid any interference with the foundations, and to obviate the want of parallelism in the two side walls. The majority have literally carried out the recommendation of the joint report of Messrs. H. I'Anson and Haywood, and provided a glazed roof over the whole area in one span, two competitors propose a nave with an aisle on the north side, to avoid obstruction to the light of the New Corn Exchange; one competitor provides two aisles, apparently with a view to symmetry of arrangement; and one proposes to cover the Exchange with two massive domes each 54ft. across.

Class 1.

B. A Wheatsheaf, is very elaborately shown by a series of showy rather than effective drawings. The two perspectives are coloured in a very forcible manner, and the report is adorned with two photographs of the exterior and interior of the Exchange. The roof in divided into 3 large bays with 4 smaller intermediate bays, with octagonal lanterns in the large divisions. The roof is carried by flat wrought-iron girders with quadrant ends resting upon iron stancheons built into the side walls.

The Flour Market is placed on the first floor of the Mark-lane building, lighted by a skylight. The arrangements for warming and ventilation are very carefully shown, and have been worked out by an engineer whose identity is not difficult to discover from the reference in the report to the buildings warmed under his direction. The question of blinds, upon which great stress is laid in the Instructions to Architects, is only alluded to in the report, and has evidently been very slightly considered. There is a certain boldness and decision of touch in the treatment of the interior which will no doubt find admirers, but it is open to doubt whether the building would turn out as well in execution as it looks upon paper. The elevation in Mark-lane depends mainly upon carving, bas reliefs, and groups of emblematic sculpture, which have very little chance of being carried out, and has very few architectural features. The massive girders in the interior would considerably interrupt the access of light to the Exchange, and the construction of the roof would render the management of blinds difficult. The Flour Market is not connected with the rest of the building, and is treated as a distinct apartment, which is a very undesirable arrangement, and there would be very little chance of adding galleries hereafter, as required in the Instructions to Architects. The lights of adjoining owners would be very slightly, if at all, affected, the north wall adjoining the New Corn Exchange being only 20ft. high, which is at least 2ft. below the lowest part of the present wall. The basement is but slightly interfered with, but it would be necessary to carry down the piers supporting the main girders of the roof. The cost is estimated not to exceed £20,000.

C. Veritas.—This is, upon the whole, an unsatisfactory design. The drawings are bad, with the exception of those showing the arrangement of the blinds, and the elevation next Mark-lane is a composition which for ugliness and pretension it would be difficult to match even in the City. The Exchange is covered by an arched roof supported by lattice principals, the feet of each of which rest upon groups of 4 light iron columns

---

[*] The Old Corn Exchange was built in 1749, and has since that time been considerably enlarged and re-arranged, the last important addition having been made about 18 years since, by Mr. Legg.

about 30ft. in height. The whole of the roof is glazed, and there are clearstory windows between each principal. The Exchange is 52ft. high to the ridge of the inside skylight, and 50ft. wide between the iron columns. An outer roof is provided to preserve an equal temperature, and prevent the unsightly appearance usually presented by single roofs.

The north wall is 33ft. high, which would to some extent interfere with the lights of the adjoining building. Cost estimated at £18,300.

The Exchange is proposed to be warmed by hot water pipes laid in the floor, covered with iron gratings. This would be quite impracticable in a corn market, as the corn thrown about would choke up the gratings and render the apparatus useless. Several of the competitors have fallen into this mistake. H (*Omne qui tulit, &c.*,) however, proposes to introduce fresh warmed air at a considerable height from the ground, through openings in the side walls concealed by the decoration; and F, *L'Etoile*, suggests admitting cold air through the spandrils of the arches, and warming the Exchange by hot water pipes placed in a case against the walls at a height of 11ft. above the ground.

D. *Honestas*. This is an extremely able and conscientious design, thoroughly well thought out. The elevation next Mark-lane is a very graceful composition; the cornice, however, is scarcely deep enough, and although the architecture of the interior is hardly equal to the external elevation, the design may be pronounced, upon the whole, both from an artistic as well as a practical point of view, the best of those submitted.

The Corn Market is covered by a double roof, the outer portion being an ordinary iron span roof carried upon upright standards resting upon the ribs of a low segmental inner roof, which is divided into square coffers, and is proposed to be glazed with "pure Venetian glass." The want of parallelism in the side walls is concealed by carrying an arcade of three arches across the Exchange at its narrowest part, dividing the area into two lengths, and masking an awkward break in the wall on the North side. This object might have been as effectually accomplished by bringing out piers on each side and turning an arch across in one span; the break would have been concealed as well, and the two intermediate columns might have been dispensed with. The roof is 32ft. high to the springing, and 48ft. high to the crown of the inner roof. The Flour Market is on the first floor, next Mark-lane, lighted by skylights towards the north, as well as windows next the street. The Flour Market is open next the Exchange, and has two projecting wings on each side in order to connect it, if required, with galleries, if these are determined upon hereafter. The blinds have been very carefully studied and are shown by a very good drawing to a scale of 4ft. to an inch. They consist chiefly of roller blinds placed under the outer roof of the Exchange, and worked from below. The flat skylight at the Eastern end of the Exchange is protected by upright screens, in which are hung Venetian blinds. The question of warming and ventilation is not so elaborately studied as it has been by some of the other competitors (notably by the author of *Wheatsheaf*), but it has not been overlooked, and it is evident that the construction of the Exchange would very much simplify any arrangements for that purpose. *Honestas* recommends the use of Watson's ventilators, which have been successfully employed, to his knowledge, in the Edinburgh Corn Exchange. The estimate for this design is £20,000, exclusive of the necessary work to the basement, and it might probably be accomplished for that sum.

E, *Iron Framed*, is a peculiar Gothic design, the author of which piques himself upon the very un-Gothic expedient of constructing the whole of his buildings of iron, and filling in between the framework with Portland stone. The plan has not been much considered, but great pains have been taken to show the paving, which is proposed to be of tiles. The market is covered by a pointed roof carried on corbels, resting on iron columns, placed against the walls. The roof is divided into six bays, and has two polygonal ends. The appearance of the interior, which is shown by a nice perspective drawing, excites some apprehension for the safety of the roof, which is not dispelled by an examination of the geometrical drawings, the construction being passed over with a light hand. The Mark-lane elevation consists of a central tower, rising to the height of 80ft., and two other towers at the flank, each 64ft. high. It is to be presumed that the author of this design has had but little experience of the difficulties attending building in the City, or he would never have proposed to carry his elevation to such a height. A double roof is provided to the Exchange, and it is proposed to place a line of pipes for warming the building in the space between the two roofs—a very good suggestion.

F. *L'Etoile* is a striking and, in many respects, an original and artistic design. It unfortunately happens, however, that in this case, as in others we shall have to notice, the author has not sufficiently appreciated the importance of non-interference with the light and air of adjoining properties. The North wall is carried up solid to a height of 42ft. above the floor of the Exchange, and above that is a semicircular glazed roof, which rises to a height of 65ft. This roof is continued through into Mark-lane, and although it may be alleged that a glazed roof offers no obstruction to light, it is doubtful whether the owners of houses on the opposite side will be brought to take such a view of the subject.

The roof of the Exchange is in one span, semi-circular in shape and carried on iron stancheons built against the walls, and concealed by columns of red Mansfield stone, 7in. in diameter, four to each stancheon. This roof is continued, as already explained, as far as Mark-lane on the West, and extends to within 20ft. of the back of Corn Exchange Chambers, and is terminated at each end by a glazed gable,

The style is Italian, but it is treated with great freedom and ability, with a strong French feeling. The elevation next Mark-lane, consists of 3 wide arched openings, supported upon rather slender stone columns, with a deep architrave and elaborate entablature, above which appears the roof of the Exchange. There is an unity of composition about this desigh which is wanting in most of those sent in, which induces us to regret the author has not paid more attention to the more practical requirements of the committtee. The elevation repeats the general features of the interior, as it should do, and there is a lightness and air of spaciousness about the interior view, which is very agreeable and appropriate. The ironwork has been carefully worked out, and is shown by a very good sheet of details. The blinds are proposed to be outside wood blinds, similar to those commonly used for conservatories in Paris, only with a slight difference in their fixing, and copper wire being used instead of iron. The scheme for warming and ventilating has been already described, and appears to be very simple and feasible. The author's estimate for this design is £18,107, or, if the roof is made wider at one end than the other, as suggested, then £19,650, which appears not too much, considering the size of the building.

M. *Light*. This design, which is the last in the class in which the roof is carried on columns, is a heavy elaborate design, in what may be called the City Offices style. Everything is large and pompous, and looks as if it cost money. The proposed building is very fully shown by 9 sheets of drawings, including 2 coloured perspectives, and there are also 2 untinted perspectives, showing parts of the interior. The roof of the Exchange has glazed quadrant sides, with a continuous lantern light, and rises to a height of 66ft. The principals are carried upon light iron columns placed as near to the walls as the irregularity of the plan will permit. The cupboards in the north wall are retained, so as to cover the break in the wall on that side. The elevation in Mark-lane, is 50ft. high, and does not show any originality. The entrance to the market, is at the north-west corner of the building, as at present, with a good staircase to the Flour market on the first floor. The Flour market looks into the Exchange area, and may communicate with the Exchange by means of the galleries, if added. The stairs to Corn Exchange Chambers, are shifted to the south-east angle of the building, but the improvement effected is not manifest.

The ventilation has not received much attention, and the warming is proposed to be by gratings in the floor, which, as before explained, would be most objectionable. The arrangements suggested for carrying out the works without interfering with the Corn market are very carefully treated in the report, and are worth consideration. The estimated cost is £18,500, exclusive of the basement.

Class II.—Without Columns.—Plans I, K, and N.

I. *Progress*, is a very original conception, and is very fully illustrated by a series of remarkably well executed drawings, the decoration in particular being admirably shown. In these drawings, as in the design *L'Etoile*, there is evidence that the author has founded his style upon the study of modern French models, and there is in consequence a refinement and completeness which are for the most part wanting in the other designs.

The most prominent feature of the design *Progress* is a large roof 70ft. high and about 50ft. wide at the level of the cornice. The ribs are in the form of an inverted catenary, and are continued down to the ground and tied at the feet by ties passing under the floor of the Exchange. The roof is by this means carried entirely independently of the walls, and the basement is consequently not interfered with. The North wall is, however, raised to a height of 32ft., for the sake of the appearance of the interior, which is a serious drawback to what is upon the whole a very ingenious design. The decoration of the interior is extremely bold and effective; a cornice is formed at a height of 32ft. from the floor, and the curved ribs are concealed by sloping pilasters projected into the Exchange, and finished with an elaborate ingenious termination resembling the prow of a vessel, most charmingly treated. The break in the wall on the North side is taken advantage of to construct a sort of pavilion, which forms a most agreeable feature in the interior. The Flour Market is arranged at the Mark-lane end, under the same roof as the Exchange, the roof being continued on to within 16ft. of Mark-lane, and terminates there in an elaborately decorated gable. There is also a gable at the eastern end of the Exchange, which would completely overshadow Corn Exchange Chambers. The Mark-lane elevation is a very skilfully designed pure Italian composition, very nicely drawn, but with rather more colour than the terms of the instructions warrant. The ventilation and blinds are not expressed upon the drawings, but provision could be made for the latter by means of the double roof, which is proposed. The cost is said not to exceed £20,000, but it is evident that much of the decoration must be omitted in order to bring it within that sum, and stripped of its decoration the design would lose very considerably in effect. Although this design impresses very much at first sight, there is a certain sense of want of practicability induced by consideration of the drawings. It appears to be the work of a decorative artist rather than a practical architect, and the airy manner in which the difficulties of the position are discussed in the report goes far to confirm the impression conveyed by the drawings.

K, a *Maltese Cross*, is a safe commonplace design, in which the requirements of the instructions are fairly carried out, but without a spark of originality, and scarcely any suggestion of improvement. The roof, semi-circular, is in one span, carried on the walls on the South side, and on the North by stancheons, some of which are placed obliquely, to avoid interruption to the light. The roof springs at a height of 32ft. from the floor of the Exchange, and rises to a height of 60ft. ; provision is made for galleries if required. The only suggestion worthy of remark is the proposal to cover the roofs with unbleached calico strained upon frames, as is done at the Crystal Palace. The estimated cost is stated at £20,000. The elevation and perspectives of this design are very badly drawn.

N. *Three Wheatears* is an ambitious and rather handsome design, coarsely and sometimes carelessly drawn, but worth consideration. The North wall is however carried as high as 32ft., which will probably militate against its chance of success. The roof is semi-circular, carried by lattice ribs and iron purlins, and is nearly 70ft. high to the ridge. The principals are carried on piers against the side walls, the North wall being brought forward somewhat in order to make the side walls parallel. The appearance of the interior is agreeable, the piers are treated as pilasters, carried up to the springing of the roof ; a frieze 8ft. high is continued round at a height of 12ft. from the floor, with a rather ill-proportioned arcade over, and a deep cornice breaking round the pilasters. The east end terminates in a gable, with an enormous wheel window, which is proposed to be filled with stained glass. An arrangement of stands is suggested, something similar to that of *Progress*, the divisions corresponding with the bays of the exchange. Inside blinds are proposed for the roof, but their arrangement is not remarkable. The Mark-lane building containing the Flour Market Committee-room and offices is 90ft high to the parapet, with a lofty roof, and contains no less than five stories, which have been apparently introduced to mask the roof of the new Exchange. The estimated cost is £20,000. which looks as if it had not been considered. The Exchange alone at 6d. per foot cube would come to almost that sum.

A. *Seges* is a modest, unpretending design, very insufficiently shown by four drawings without any perspective, but it should not on this account be passed over. The Exchange consists of a nave 45ft. wide, covered with a semicircular iron roof 56ft. high, which is the same height as the present cupola, divided into six bays. On the north side is an aisle about 10ft. wide and 18ft high, roofed with a flat skylight, by which means all interference with the adjoining lights is prevented. The architectural character of the building is not of a high order, but it is much in advance of other more showy designs. The elevation next Mark-lane has the merit of expressing the system of construction adopted for the interior, the nave being emphasised by a break, and the front of the aisle receiving a different treatment to the rest of the front. The cost is estimated at £16,000, exclusive of heating and fittings.

L. *All's Well that Ends Well* is an original but rather eccentric composition, and is shown by four very well executed drawings, evidently by the author's own hand. This is the only design with a flat ceiling, The nave is 46ft. wide and 46ft. high, with a range of clearstory windows on the north side overlooking an aisle 11ft. wide and 33ft. high. The lighting is peculiar, the roof being divided by beams into coffers, which are pierced in the centre, and covered with half-domes of glass, 6ft. 10in. in diameter. The effect of the interior as shown by the perspective is far from unpleasing, but the general design is too archaic to find favour with the practical men of Mark-lane. The elevation next the street is decidedly Romanesque, and is prettily composed. The author suggests that the first-floor of the Corn Exchange Chambers should be appropriated to the Flour market, and the whole area of the Exchange left open. He estimates the cost at £18,000, which seems a moderate estimate.

G. *Au bon Droit* is the only design which shows a double aisle. The nave or central portion is 30ft. wide, and the aisles each about 13ft wide. The nave has a glazed semi-circular roof, resting on iron columns, and the aisles glazed quadrangle roofs resting partly on the walls. The Exchange would be 187ft. by 60ft.. The foundations would not be interfered with, the columns resting upon the old vaults under the Exchange. The floor of the Flour market is proposed to be constructed of iron, in small squares, filled in with glass, to prevent loss of light to the Exchange below. The elevation in Mark-lane is a weak, characterless Italian front, but the interior, as seen in the perspective, is agreeable. The author states that he has had the quantities taken by an eminent building surveyor, and is prepared to say that the cost will be £19,450.

H. *Omne tulit punctum qui miscuit utile dulci.*—A magnificent but utterly impracticable design. The market is covered by two domes each 54ft. in diameter, the upper part of which are glazed, resting upon massive piers built against the side walls. The central piers are 15ft. wide, and project 6ft. from the walls. The stalls are arranged in the recesses between these piers. The side walls are carried up to a height of 80ft., and there are no signs of any attempt to conciliate the prejudices of adjoining owners. The front in Mark-lane is 83ft. high to the top of the parapet, with dormer windows, and a lofty roof 108ft. high, which height is continued over the whole of the Exchange area. The view of the interior is a most exquisitely drawn and coloured drawing, by Mr. Brewer, with the decoration worked out in the most elaborate manner. It would be impossible to see the Exchange in the manner represented if it were carried out, and the drawing must be looked upon as a study of decoration rather than a perspective drawing of what the building would be. The style adopted is the French Renaissance, such as is used at the chateaux of Blois and Chambord. The elevation next the street is less successful than the interior, but is nevertheless very ably treated.

ANTIQUITIES OF ROME.

At the last meeting of the Archæological Institute, Mr. Parker gave a most interesting description of the work of investigation into the antiquities of Rome as recently carried on by himself and others, referring to the series of photographs which he is now exhibiting at Cundall's Gallery, in New Bond-street, to which we have already briefly called attention. As these photographs will be found of the highest interest, and will only be on view for a very short time, and as their number and variety are necessarily somewhat embarrassing to visitors who have not themselves seen the originals, we propose to note some of the more salient ones, and to give a clue to the objects they represent. The character of the construction of the walls of the various fortifications and edifices in Rome is a sure test of their age, and is therefore the first point to be mastered. This may readily be done in this exhibition, as photographs specially taken for the purpose are arranged chronologically. By these it will be seen that the work of the periods of the Kings, of the Republic, and of the Empire are clearly distinguishable as follows :—That of the *Kings* consists of large oblong blocks of tufa stone, set, as it were, in what is called, with regard to brickwork, English bond fashion—that is, headers in one course and stretchers in the next, and without mortar. They have not been neatly wrought or polished on the face, but roughly hammer-dressed only, and towards the end of this period, as in the work of Servius Tullius, they have the edges chamfered, and are cramped together with iron cramps, which are simple bars of that metal with each end turned down.

The student may study with advantage photograph No. 779 as illustrative of work of the age of Romulus, being part of his supposed wall on the Palatine, B.C. 750 (?) By the rod marked with feet placed alongside, the stones would appear to average 4ft. in length by 2ft. in width. Photograph No. 829, of the Wall of the Kings on the Aventine near S. Bisca, shows well the internal structure, and gives the thickness of the wall, which is about 10ft., against which a later concrete wall or facing has been erected, giving an additional thickness of 2ft. Photograph No. 792 shows a part of the walling of Servius Tullius, and No. 141 a larger portion of the Wall of the Kings, with an inserted arch of the time of the Empire, or, as it is thought, by Hannibal, and No. 1582, Gabii, may be referred to as exhibiting the character of these primitive fortifications—in this case the wall being only the natural rock cleft, with the modern huts forming the village of Castiglione clustered under its shelter, in the exact form and manner of those described by ancient writers. It is to be regretted that the portion of the wall of Servius Tullius which was discovered has since been very ruthlessly and needlessly destroyed by the railway company upon whose ground it stood. The work of each successive king, or to speak more correctly, of each half century during their reigns, are distinguishable by the size of the stones used.

The character of the work of the time of the *Republic* is specially of concrete. This was at first faced with wood, which has perished, but left the holes visible by which it was fixed. Probably at first the concrete was used without knowledge of its strength for the purpose of rendering more stable the wooden construction on which reliance was placed, and that as experience was gained the wood was abandoned and the facing became of the reticulated and other descriptions which mark the time of Sylla. The photograph of the Emporium, about B.C. 175, well illustrates this class of construction, as also No. 70, in which it is shown at the junction with the city wall. No. 364 is a photograph of remarkable interest. In the catalogue it is called "Walls of Rome, Palace of Sylla (?) c., B.C. 60. Part of the substructure against the cliff of the Pincian Hill." It shows two tiers of niches, a style of construction much used in the walls of Rome, for the following reason : A portion of walling built against the cliff had settled to such an extent that it overhung, and still overhangs its base considerably. The builders, finding it at last went no further, and had come to its final bearing, built, as may be seen in other photographs adjoining this, another height of vertical walling upon that which had settled, and for lightness and strength made it in a series of niches, the piers of which formed buttresses, and on to which the arched linings of the niches threw the weight or thrust, and this was found so successful and economical a method that they continued to build the walls afterwards in the same manner from the ground, placing one tier of niches above the other.

The work of the *Empire*, is mainly brickwork, varying in the successive centuries both as to the thickness of the bricks and of the mortar joints, from 10 courses to the foot in the 1st century, 8 courses in the 2nd, six in the 3rd, to 4 only in the 4th. The perfection of this Roman brickwork was in the time of Nero. In the early period of the Empire travertine blocks began to be used, tufa blocks only having been previously employed, and the facework was better wrought. (See photograph No. 67, the arch of Dolabella, A.D. 10). Photograph No. 21 may also be examined with advantage ; it shows two arches at the

Porta Triburtina at different levels; the nearer one is of the time of Honorious, A.D. 400, who added gates to the walls, another of which is well illustrated in photograph No. 668. Beyond this inner archway, which is at a proper level above the present surface, is another of the time of Augustus, the jambs of which are almost completely buried; this difference between the levels tells a curious tale—namely, that originally the excavated trenches of the fortifications were used as the roads, and the archways in the walls accommodated thereto, and that at a subsequent period most of these sunk roads, which resembled the lanes in Devonshire, were filled up, and the new gateways made to suit new roads formed on the surface of the general ground. The tradition that all the soil of Rome has been greatly raised is incorrect, and founded upon a misapprehension of the above facts, an evidence of which was till lately presented by the juxtaposition of these two arches. The inner one, however, we regret to learn, has, since the photograph was taken, been destroyed to serve some miserably small economical purpose of the Papal Government. Photograph No. 34 represents a portion of the Amphitheatrum Castreuse, c. A.D. 166,—L. Verus, and shows some of the best description of brickwork, with an attached order, the columns of which have good capitals of moulded brick or terra cotta. Photographs Nos. 1206 and 1216 excellently show the very fine walling of Aurelian, with its remarkable corridor for the sentinels within the thickness of the wall, a work of stupendous magnitude considering its length of many miles. Previously a mere pathway on the inside of the walls had been the only provision for this purpose.

Another set of the photographs which excited considerable interest at the meeting of the Archæological Institute were those of the Marmorata, or wharf for landing marble, &c., under the Emporium excavated in 1869, with walls forming the facework of the bank towards the Tiber, with the opus reticulatum of the 1st century, with the clivus or inclined landing stage, paved with square slabs, and bold corbel stones projecting from the top of these with a large hole drilled in them for ropes to pass through to moor vessels by. In front of one of these wharfs there is a square panel inserted, with an amphora carved upon it to indicate the place for landing wine or oil. (See photographs 1045, 1048, and 1169.) No. 1170 has especial interest, as it shows one end of a large column of marble buried in a singular manner in a dock of that period and built over in the Middle Ages. This column it has been determined to erect in commemoration of the present Œcumenical Council, but unfortunately it was not found to be as long as was expected, and so another archæological monument of value has been destroyed to provide material to make a base under it, to raise it to the desired height.

The series of photographs and drawings connected with the aqueducts are most valuable, but we have not space to speak of them, and they form a subject more suitable to civil engineers to investigate. The French Government has recognised their value by ordering copies of the whole series for practical purposes, and have expressed their gratitude for this work having been done, as they had contemplated doing it themselves, with the view to assist their engineers in the arrangement of the water supply of the metropolis and towns of France. We may perhaps call attention to photograph No. 1066 as well illustrating the reticulated work, c. A.D. 100, which faces the pier of Aqua Trajana.

To the very large collection of works of art in the catacombs and museums of Rome we have not space now to devote, but there are two—Nos. 1500 and 1501—which we propose to enlarge and illustrate in a future number of our journal, as of remarkable curiosity and interest to our readers. The former of these, from a tomb of the Aterii of the 1st century, now in the Lateran Museum, illustrates a bas-relief in which are represented a temple or tomb, and a machine for raising stones and a ladder by means of a treadmill, as mentioned by Vitruvius. This tomb was thought to be that of an architect. The latter, from another bas-relief, also from the tomb of the Aterii, contains representations of various structures, such as temples and triumphal arches, so that it also would appear to be the record of the works of architects of that time. The above samples out of a collection of 1800 historical photographs will, we think, serve to show that they contain a mine of wealth to architectural students, by whom we hope the opportunity of this exhibition will not be neglected. J. P. S.

ARCHITECTS AND THE LAW.

Clown: But is that law?
Gravedigger: Ay is't, crowner's 'quest law.
Hamlet.

THE legal rights of architects, so often the subject of recent discussion, have received some elucidation from the trial of the case Ebdy v. McGowan, a report of which we give in another column. We remember hearing somewhere of a midshipman who, having to fill up a return concerning the natives of some remote island, did it as follows:—"Manners, none;" "Customs, disgusting." We fear it has been hitherto too much the fashion, even amongst themselves, for architects to be considered as a class of men about which it might be said in the same way—"Rights, none;" "Responsibilities, innumerable." Whenever by any chance an unfortunate architect has acted without due skill, exceeded his estimates, overlooked bad work, or otherwise failed in his duty, he is fair game, not merely for heavy deductions from his fees, but also for actions for damages—of which we have had occasion in our time to record not a few; nor are there ever wanting brethren of the craft to bear witness against him for real or imaginary derelictions; so much so as, on one notable occasion, to draw from Lord Campbell the remark, that of all species of enmity the *odium architectonicum* was about the worst.

When, however, an architect has honestly discharged his duty, and sent in a moderate and reasonable claim, in accordance with the published rules of his profession, but some wrong-headed or close-fisted client chooses to dispute it, his rights are apt to become very obscure. If he appeal to some of the "dons" or "pundits" of the profession, he is advised to "take whatever he can get," and "keep out of law, at any rate," for that the regular charges are "only recommended, and cannot be enforced." We are happy to say that the law of the land, as shown in this case, is more rational and intelligible. As well tell us that the Bank of England is only "recommended" to pay the value specified on its notes, and that payment "cannot be enforced," as that an architect who has done honest work on the order of a client, is not to be paid for it according to the regular scale of his profession, but according to the mere whim or fancy of that client. No doubt mild "recommendations" are very good in their way, but are much more likely to be acted on when it is known that they have the majesty of the law to "enforce" them in case of need.

It is rather remarkable that the burden of contests such as the present generally falls to the lot of the younger and less known architects. Roguish committees and clients think twice before they refuse to pay the claims of the leaders of the profession. A notable instance of this we had recently in which a church committee, having discarded the designs of a leading architect, were astonished by the receipt of a bill for £700 from him (we presume his full commission), which we are told "fell like a bombshell among them," and caused them to reconsider their decision, as such a great gun in the profession was evidently not to be trifled with. It would be different had a younger man been concerned, who would in all likelihood have asked only half the money, and whose modest claim would have been resisted to the utmost. At least such seems to be the way as regards the plaintiff in the present case, whose only fault seems to have been that his claims were too small, nothing having been charged by him for a good deal of work done, such as to elicit an observation from the Lord Chief Baron, "that he had certainly not shown any grasping disposition"; but who, in recognition of this spirit of moderation, is rudely dismissed and his claims, however fair, resisted to the last. Those of our readers who will study the evidence about the parsonage, and the arbitrary conduct of the rev. defendant, will only wonder that the latter was let off so cheaply, and that the plaintiff did not claim, as he certainly might have done, his full commission on that work, he being ready and willing to do his part, and only prevented by the unwarrantable interference of the defendant. His retention of the drawings was both reasonable and usual. To give them up would be just to put a premium on wrong doing, encouraging the client to dismiss him, and place the work in other and, possibly, incompetent hands. On this point we cannot but express our surprise that an architect of such standing as Mr. Sydney Smirke should have given such unsatisfactory evidence. According to it, a client though not entitled to the drawings for the 5 per cent., still may dismiss the architect when the drawings are prepared, and then may claim them for 2½ per cent! Surely, this is a patent absurdity, and we trust the eminent architect, who we think was rather betrayed into it than otherwise, will see it to be such. We know the stock argument—"the client, then, gets nothing for his money." We answer, "If the project be abandoned, he cannot need the drawings, but if he arbitrarily dismisses the architect who prepared the drawings on the faith of having the superintendence also, he (the client) properly deserves to get nothing." It will be observed that the learned judge gave the defendant leave to move the full court to reduce the verdict on this point if he thought he could show cause. If he thinks fit to do so, we shall probably have the subject ably argued, and we confidently anticipate such an utterance as will for ever dispose of this question, to the full satisfaction of the profession. The rev. defendant may thus, though unintentionally, serve the cause of a profession for which we fear he hardly entertains sufficient respect. He has already done it good service by causing a verdict to be given fully in accordance with the Institute scale, which we opine it will be hardly safe to question in future. We, however, advise him, in accordance with the suggestion of the Chief Baron (not to speak of higher principles), to make it up with his architect as soon as possible, allow the latter to go on with his work and build the parsonage, and then bury all differences in a good "house-warming." W. F.

THE CORN EXCHANGE COMPETITION.

AFTER a very careful examination of the drawings, and after several meetings at which they were assisted by professional assistance upon points of construction, the committee finally decided upon recommending the design D, Honestas (Mr. H. Stock), to be carried out, and the designs Progress (Messrs. Watson and Hesketh), and A Wheatsheaf (Mr. Crossland), for the second and third premiums respectively. This recommendation was on Thursday week ratified by a meeting of the general body of shareholders. There was a very close contest in the committee between the two first competitors, Mr. Stock's design having been chosen, upon a division, by 21 votes to 18.

We have every reason to believe that the competition has been conducted in a perfectly honourable and disinterested manner, and we congratulate Mr. Stock upon his deserved success. His design is shown by a series of very well executed drawings, in which the whole of the construction is very clearly indicated, and there is no reason why it may not be carried out with scarcely any variation from the competition drawings. The favourable remarks we have made elsewhere upon Mr. Stock's design were written before the decision of the committee had been arrived at.

Names of Competitors.

A, Seges	Mr. Caldwell.
B, A Wheatsheaf (device)	Mr. William Henry Crossland (of Leeds).
C, Veritas	Mr. Joseph Peacock.
D, Honestas	Mr. Henry Stock (Messrs. Snooke & Stock)
E, Iron-framed	Henry Carr (engineer).
F, L'Etoile	Mr. Cuthbert Brodrick (of Leeds).
G, Au bon droit	Messrs. Salter & Wyatt.
H, Omn tulit punctum qui miscuit utile dulci	Mr. G. Gilbert Scott, jun.
I, Progress	Messrs. Thos. Henry Watson & Robert Hesketh.
K, A Maltese Cross (device)	Mr. George Barnes Williams.
L All's well that ends well	Mr. George Truefitt.
M, Light	Mr. Edward Augustus Grüning.
N, Three Wheat-ears (device)	Messrs. Giles & Biven.

ARCHITECTURAL ASSOCIATION.

THE concluding meeting of this Association for Session 1869-70 took place on Friday evening last, Mr. Lacy W. Ridge, President, in the chair. The minutes of the previous meeting having been read and comfirmed, a vote of thanks was passed to Messrs. Davis and Emanuel for permitting the members of the Association to visit the new Jewish synagogue at Upper Berkley-street.

The Exhibition of 1871.

Mr. J. Douglass Mathews, honorary secretary, said that two meetings back he read a letter from Lieutenant-Colonel Scott (Secretary to the Commissioners for the Exhibition of 1871) asking the Association to appoint a member of the Association to serve on the jury for the subject of Architecture in the ensuing Exhibition. In compliance with that request, Mr. Hayter Lewis was nominated to the post, but a letter had been received from that gentleman, stating that absence from England, and other causes, would prevent him from acceding to the wish of the Association. In the room of Mr. Hayter Lewis, Mr. Mathews proposed that Mr. T. Roger Smith be asked to accept the post.

Mr. Tasker moved, as an amendment, that (in view of the manner in which the President of the Institute had been treated by the Commissioners) the Association send no representative at all. He thought it would be highly presumptuous for them, as representing the junior members of the profession, to have anything to do with the Exhibition after the Institute had declined, as a body, to have anything to do with it.

Mr. J. T. Perry seconded the amendment. He did so, he said, quite apart from the manner in which the Institute had been treated by the Commissioners. The Institute had declined, as a body, to have anything to do with the Exhibition, and, as a result, Architecture would not be so well represented as it might be. But the Commissioners of the Exhibition would say, whatever was the quality of the show made by Architecture, that it was properly represented, whereas in all probability it would only be represented by the younger members of the profession. He thought the Commissioners insulted the Association by putting it on a par with the Institute.

Mr. Mathews said the Association had nothing whatever to do with the course taken by the Institute. The Institute had declined to have anything to do with the Exhibition because its President *ex officio* was not put upon the list of Commissioners. But although this demand of the Institute was not acceded to, two of its past Presidents had been put upon the Commission. The Commissioners had invited, not only the Institute and the Association, but the Architectural Museum and the Architectural Exhibition, to select representatives to serve as jurors, and the two latter bodies intended to conform to the request. It was quite certain, continued Mr. Matthews, that the ensuing Exhibition would be an exceedingly popular one, and if the whole body of architects snubbed its promoters they would make a mistake. Foreign architects were taking it up, and it behoved the English not to be behind hand. Any professional pique against the Exhibition on account of the President of the Institute *ex officio* not being one of the Commissioners should be waived on the present occasion. Besides, if the Association selected a representative juror, he would represent Architecture as a profession as well as the Association as a body, and whether the majority of the designs exhibited came from the younger or senior members of the profession, Architecture would be very much judged of by the show presented. The Exhibition, too, was to be annual, and in all probability the Architectural Exhibition would, in course of time, be merged into it, and therefore the works of architects would come before the public in a degree hitherto unknown. There would be nothing gained by refusing to send a representative; in fact, much would be lost by taking such a course. The refusal to put the name of the President *ex officio* of the Institute upon the Commission was not necessarily an insult to the profession. The next best thing had been done by the Commissioners—viz., to add to their number two past Presidents of the Institute. By the Charter of the Commissioners, only two *ex officio* Presidents of societies are eligible as Commissioners—viz., those of the Institution of Civil Engineers and the Geological Society. Just at present the general feeling of the public was not very favourable to architects, and however wrong the public impression might be, a factious opposition to the Exhibition by the profession would only confirm that impression.

The Chairman said he thought it would be wise to keep to the course which the Association had previously chalked out for itself in nominating Mr. Hayter Lewis. The grievance (real or imaginary) of the Institute was not one which the Association was called upon to take up. The Institute had refused, as a body, to have anything to do with the Exhibition for a reason purely personal to itself, and not to the profession generally. The Association was asked by the Commissioners to nominate a gentleman to serve as one of a jury of six architects and two laymen, and in order that the architectural members of the jury should have the confidence of the profession, the architectural societies were asked to nominate them. He thought that the accidental circumstance (for such it appeared to have been) of the President *ex officio* of the Institute not being on the Commission had been to a certain extent fairly met by putting on the commission two past Presidents of the Institute, men of extremely influential position, one of whom, Sir William Tite, had only just retired from the office of President, the other, Mr. Beresford-Hope, having preceded Sir William in the same office. The Institute had not, perhaps, gone the best way to work to attain the end desired; at any rate, the result was that the Institute would do nothing as a body, though it did not seek to prevent its members sending in anything they liked to the Exhibition. He was sorry that this was another instance in which the Institute had signalised itself by doing nothing—for there were quite enough instances already on record; and were the Association to abstain from sending its representative, the result would be to throw the whole influence of architecture into the hands of South Kensington, and that nobody wished to see. The suggestion that the professional societies should nominate the professional jurors had been adopted by the Commissioners, and no feeling of pique should prevent the Association from sending a representative to serve on the jury.

Mr. Phene Spiers said the Association was placed in a very different position to the Institute with regard to the Commissioners. The Institute had a certain end in view, though to attain it they did not go exactly the right way to work. Failing in the attainment of their object, they, from a feeling of pique, refused to have anything to do with the Exhibition. The Association had no pique against the Commissioners, and he thought that in such a matter the Association was not in any way bound to second the movements of the Institute. He knew that there were a great number of members of the Institute who thought the action taken by that body was unwise. If they (the Association) were always to follow in the wake of the Institute they would soon come to the ground. It was to having taken their own course with regard to the management of the Association that they owed the position they had now attained. Mr. Roger Smith was one of the oldest and best friends of the Association, and, moreover, a man in whose judgment confidence could be placed, and he had great pleasure in seconding the nomination of that gentleman.

On being put, the original motion was carried by a large majority, and Mr. T. Roger Smith is therefore to be asked to undertake the office.

Election of Office-Bearers.

Messrs. Tasker and Salmon were then elected to serve as scrutineers of the voting papers for the election of office-bearers for session 1870-71, and upon their return to the room announced the following gentlemen to be elected:—

President.—Mr. Thos. H. Watson, A.R.I.B.A,

Vice-Presidents.—Messrs Rowland Plumbe F.R.I.B.A., and J. Douglass Mathews, A.R.I.B.A,

Committee.—Messrs. C. Aldridge, T. Batterbury, H. C. Boyes, J. E. Fogarty, E. C. Lee, T. E. Mundy, J. T. Perry, L. W. Ridge, R. P. Spiers and W. L. Spiers.

Hon. Treasurer.—Mr. J. Douglass Mathews

Hon. Solicitor.—Mr. Francis Truefitt.

Auditors.—Messrs. Edward D. Drury and A. W. Tanner.

Principal Librarian.—Mr. H. W. Lonsdale.

Assistant Librarians.—Messrs. W. L. Spiers and J. E. Flint.

Hon. Secretaries.—Messrs. John S. Quilter and Bowes A. Paice.

Registrar.—Mr. John S. Quilter.

Collector.—Mr. Edmund Marshall.

Destruction of Works of Art by the Police.

Mr. J. T. Perry then brought before the meeting the case of Henry Evans, who was convicted at the Middlesex Sessions, on the 18th of March last, of selling so-called indecent prints and photographs, and sentenced to two years' imprisonment, with hard labour, and a fine of £50. Mr. Perry said that the man Evans was well known to art students, and kept a little shop in Endell-street, Long-acre, where he had been in business for the past six years, during which time he had borne an excellent character. For many years he had acted in an official capacity for the Microscopical Society, and a principal part of his business has been to supply "life studies" to artists for artistic purposes. The photographic studies produced in evidence against him at the trial were made from the living model, and from well-known pictures. Such photographs were purchased by him in large quantities, and retailed by him at exceedingly low prices, contrary to the practice of dealers in indecent photographs properly so-called. The witnesses who appeared against him at the trial deposed that he told them that he only sold such things for artistic purposes. His case was about to be brought before the Home Secretary, and Mr. Perry asked for signatures to a petition to Mr. Bruce embodying the foregoing facts, and submitting that studies such as were to be procured at Evans's shop had become a necessity for art students, being less costly to them than the employment of life models, and that they were to be purchased in many places in London, though seldom well selected, and at much higher prices than those affixed to them at Evans's. It was also stated in the petition that the bulk of the studies which brought the accused under condemnation were studies bearing the stamp and sold under the sanction of the *Ecole des Beaux Arts* of Paris, and that studies in oil by students of the Life School of our own Royal Academy were also seized and condemned. More than this, a set of small etchings, studies by the famous artist Anibal Caracei, have been burned by the police. At the time of his arrest Mr. Evans was in treaty with the authorities of the British Museum for the sale of this collection to the nation. In consideration of these facts, in conjunction with the delicate state of Evans's health, the petition asked for a mitigation of the sentence.

Mr. Phene Spiers said he knew the man and his shop well, and had often purchased photographs there. At the Academy *soiree* the other night he heard several of the Academicians and Associates complain bitterly that the police could not distinguish between the scamps of Holywell-street and those who render service to art.

The Chairman could quite understand that policemen of ordinary education would not know the difference between that which was artistic and that which was indecent, and until we could employ men of art education as policemen he was afraid there was no security against valuable works of art being destroyed by them in their zeal for public morality. However, it was the duty of all engaged in art pursuits to endeavour to get this man out of difficulty, and he therefore hoped the petition would be numerously signed.

Mr. J. Douglass Mathews then read a paper prepared by Mr. G. H. Birch (who was absent owing to illness), entitled "An Historical Description of the Charterhouse," but as this was almost entirely historical in character, and as many of the facts relative to the early history of the place were given by the Rev. Mackenzie E. C. Walcott in The Building News for March, 4 last, page 177 we need not further occupy our space with the subject.

The usual vote of thanks to the retiring officers having been carried with acclamation, this, the last meeting of the present session, terminated.

The annual dinner took place at the Talbot Hotel, Richmond, on Saturday last.

During the recess, books from the library may be exchanged every Friday, between ten and five o'clock, and on the evening of the last Friday in each month between seven and eight o'clock.

Arrangements are in progress for an architectural excursion to Lincoln and its neighbourhood, under the conduct of Edmund Sharpe, Esq., M.A. (author of "Sharpe's Parallels"), during the week commencing August 22nd, further particulars of which will be announced.

◆

THE DECORATION OF S. PAUL'S CATHEDRAL.

We desire to direct the attention of our readers to a public meeting to be held at the Mansion House next Wednesday (the 13th inst.), for the purpose of taking steps for carrying out the intentions of Sir Christopher Wren as to the internal decoration of his noble masterpiece. It will be in the remembrance of our readers that in the year 1858 Dr. Milman, the late Dean of S. Paul's, made certain proposals connected with the cathedral over which he presided. The one was to provide for special, and particularly evening, services under the dome; the other was to complete the decoration of the interior of the church. The former of these objects has been undoubtedly achieved; but the appeal on behalf of the ornamentation of the edifice has hitherto met with but an indifferent and partial recognition, and what should be a warm and resplendent sanctuary is still not only bald and cold, but in some respects repulsive.

It is not generally known that the vast property formerly belonging to S. Paul's, having been vested in the form of separate estates, has now lapsed to the Ecclesiastical Commissioners under the provisions of the 3rd and 4th Vic., c. 113, secs. 28 and 51. The revenues from this property amount to no less a sum than £90,000 a year. Had this money still remained at the disposal of the Chapter, there would have been no necessity for the appeal they have issued; but as it has been used to supply the spiritual wants of the whole kingdom, there can be no doubt that the country at large should subscribe towards the ornamentation of the only cathedral built by Protestant hands and money. The committee, in a document just issued, says:—

"The leading principle affirmed by all who have been consulted is this—To make Sir Christopher Wren's intentions for the completion and decoration of the Cathedral the main text, as it were, and to study to carry out as implicitly as possible whatever he may have expressed in drawing, model, or writing; and, where these materials for guidance fail, that harmony is to be sought for to the fullest practicable extent with what he has proposed or done.

"Sir Christopher Wren's views are consistent with the most magnificent ideas. We know that mosaic, painting, rich marbles, and sumptuous gilding entered largely into the calculation of what he thought was due to his design.

"One of his recorded conceptions, that of using the space under the dome for a vast auditory ere its value was almost neutralised by the close choir screen and central organ, forced upon him, has been completely realised. The object now proposed is the other, that of rendering the interior of S. Paul's worthy of its unrivalled exterior.

Much, indeed, is needed to add unity and finish, as well as proper ecclesiastical character, to the existing arrangements for extended worship. But the committee are not disposed to weaken the claim which the Dean and Chapter clearly seem to have upon their alienated revenues for these legitimate purposes of public worship by again undertaking their charge. Their present appeal is solely for the achievement of that magnificence of ornament which they cannot doubt that London and England would desire, but which the Ecclesiastical Commissioners could not with any propriety be asked to furnish.

"Sir Christopher Wren's marble ciborium, or "altar-piece," as he called it, and a magnificent open choir screen—which, with its architecture, metal work, and sculpture, should be a very gem of art—would, however, naturally fall to the part of the committee.

"The better to illustrate the idea of the magnificence which has been imagined, let the entrance be supposed at the west end, about to become the easiest access to the Cathedral. On passing through bronze doors richly charged with devices, the first most striking effect would be produced by the brilliant roof covered with mosaic patterns and rich with gold. The cupola immediately overhead, 40ft. in diameter, and the panels of the exquisite side chapels, would be pictorially treated in the same material. The walls relieved with marble slabs and marble inlay; the pavement also and the windows, enriched with colour, must be so treated as to preserve a due regard for breadth of effect and the necessity in S. Paul's for a large amount of unobstructed sunlight. All panels to be filled with coloured marbles or sculpture, and no niche to be without its statue. The nave and transepts must, however, be in some respects subordinate to the choir.

"In the great dome, which has been happily called the very 'essence of the building,' the *grisaille* pictures of Sir James Thornhill cannot fail, ultimately, to give place to Sir C. Wren's cherished wish for mosaic pictures, and, in addition to these the drum and the eight spandrels (the latter already commenced in mosaic) will afford grand scope for the highest efforts of art and magnificence.

"The roof of the choir should be a splendid and impressive work in mosaic, elaborate while massive, and dignified in general effect surpassing the richness of the rest of the church. The windows in the apse will here also be more fully coloured; and the marbles, whether used structurally, as replacing the stonework of the principal pilasters, or in panels and inlaid patterns on the walls and pavement, would all be arranged so as to impart a fuller idea of sumptuousness. This must be especially the case with the ciborium and the choir screen already referred to.

"It would be the aim of the promoters of this work to make it the occasion of educating and advancing public feeling in the application of the noblest and most beautiful products of human intelligence and skill to sacred things, and for the advancement of national art. It would be their desire to prefer what would be calculated to give religious dignity and artistic value to the building to what is merely fanciful or ornamental merely as an ornament."

◆

S. SWITHIN'S CHURCH, LINCOLN.

Mr. Christian's report on the late accident at S. Swithin's Church was presented to the vestry on Friday last. It is an elaborate inquiry into the causes of the failure of the pillars, which Mr. Christian believes to be as follows:—

1. The departure from the requirements of the drawings by increasing the numbers of the stones, and consequently of the beds in the shafts of the pillars.

2. Imperfection of working in the beds of the stones, and imperfection and insufficiency in thickness of the mortar joints between them.

3. The racking of the heavy walls which the pillars support, each 107 feet long and 40 feet high, disconnected at each end, and left entirely without lateral stay or support, caused by the violent gales of last autumn, and other like causes before incidentally referred to.

As to the liabilities involved:—

As regards the Architect:—1st. I am clearly of opinion that in respect of constructive design, whether as shown by the drawings, or described by specification; whether as to quantity or description of material; the provisions made by him are in every respect sufficient for sound and durable construction.

2nd. That the omission from the specification of all provision for temporary supports whilst building, especially under the circumstances under which this church was erected, was undoubtedly an oversight, but one that, had the work been entrusted to a contractor of ample means, plant, and experience, would probably have been met by his own provision for temporary insurance.

3rd. That having made careful drawings, showing the exact number of stones to be placed in each pillar, he should have required the contractor so to execute them, and not have allowed any deviation from his instructions.

4th. That although thereby his responsibility was shared, and in part removed, he should not have allowed the contract so to be framed as to invest the committee with equal authority to his own in respect of approval and direction of the work, nor should he have submitted, except under written protest, to the instruction that he was not to visit and inspect the progress of work, unless he was sent for by you.

As regards the Contractor:—I am of opinion that he has incurred responsibility, 1st, in constructing the pillars with a larger number of stones, and consequently of beds, than are shown by the drawings.

2nd. By insufficient care in working the stones, and in forming perfect beds between them of sufficient thickness; and,

3rd, by neglecting to take any precaution whatever for securing the arcade walls during erection, he being bound by contract to make good all damages arising from "storm or tempest," and to deliver up the building when complete, "free from all flaws, cracks, settlements, or other defects."

And I am further and clearly of opinion that the defects which have occurred result from these deviations from the duty of a builder, and consequently that, excepting on the second point, as regards architect's liability, he alone is responsible for making them good."

◆

ANCIENT v. MODERN HOUSES.

Mr. C. J. Palmer, in the second part of his "Perlustration of Great Yarmouth," just published, says, in reference to the ancient houses of the town:—"The houses of the sixteenth and seventeenth centuries, with their fronts of cut flint or moulded bricks, barge-boarded gables, stone dressings, high-pitched roofs, rounded chimneys, ornamental ironwork, quaint external carvings, ample porches, large oblong and many-lighted windows, and latticed casements, had a much more striking and picturesque appearance than those of modern times. Many of these mansions remained intact until the close of the last century, when the rage for altering everything that was old set in. The fine old fronts were cased over with white bricks, then recently introduced; merchants' marks, tapestry irons, and other external ornaments disappeared; unmeaning and useless parapets were run up to hide high-pitched roofs and dormer windows; the old porches were removed, and modern 'porticos' substituted; and the house made to appear externally as if recently built. In the interior the wainscoting, tapestry, and leather work were torn down, or the fine old panels and sumptuous chimney-pieces were painted white. The folly of this is now generally admitted, and much would be given if what was so ruthlessly destroyed could be restored, for the fascination which clings to an old building can never be revived in a modern habitation. In bygone times, when a man built a house, it was a solid structure, with deep foundations, thick and firm walls, strong beam and rafters of enduring oak or chestnut, made to stand and to be used for generations. In such a house he would pass his life, and when he died it would descend to his children, until the family became extinct. Such houses are not built in towns at the present day."

◆

CARE OF BRUSHES.

Brushes used for applying finishing varnishes should be cared for with the utmost pains, as good work depends much upon the good condition of the brushes. The *Coachmakers' Monthly* suggests that a good way to keep them is to suspend them by the handles in a covered can, keeping the points at least half an inch from the bottom, and apart from each other. The can should be filled with slow drying varnish up to a line about a sixteenth of an inch above the bristles or hair. The can should then be kept in a close cupboard, or in a box fitted for the purpose. As wiping a brush on a sharp edge of tin will gradually split the bristles, cause them to curl backwards, and eventually ruin the brush, the top of the can should have a wire soldered along the edge of the tin turned over, in order to prevent injury. Finishing brushes should not be cleansed in turpentine, except in extreme cases. When taken from the can, prepare them for use by working them out in varnish, and before replacing them cleanse the handles and binding with turpentine.

◆

Name?—The *Rock* says an architect has issued a pamphlet in which he states his desire to build an immense national mausoleum. "The building is to contain space for the interment of 2,000,000 bodies; the style is to be Gothic, and for size and magnificence S. Paul's and S. Peter's at Rome will be to this new building as dwarfs are to a giant." (!)

MOUNT SORREL GRANITE.

THE mention of granite must be a painful subject to the inhabitants of most large towns, and there can be but very few persons nowadays who have not at some time or other had cause to lament the discoveries of the famous Macadam. Granite as a material for road making is only too familiar to Londoners, and the periodical disturbances of some of our principal thoroughfares make us anything but agreeably conscious of its presence. The stone moslty used for this purpose in London comes from Guernsey, and is of a dark blue colour. Its hardness renders it extremely difficult to work, and its colour is against its employment except for this and similar purposes. Few probably are aware that in the heart of Leicestershire, and in the centre of the secondary formations, we have an outcrop of primary rocks, called by Professor Sedgwick "an outlying boulder." These rocks, constituting the table land of Leicestershire, are terminated at Mount Sorrel by a line of bold cliffs, forming a very noticeable feature to the west of the Midland Railway between Sileby and Barrow stations. This district is quarried for granite and slate at several places, all of them within a few miles of Leicester, the slate being very hard and difficult of cleavage, and the granite varying in colour from a deep red to a bluish grey I propose in the present paper to lay before your readers a few facts on the subject of granite working, collected during a stay of some weeks in the neighbourhood. The works at Mount Sorrel are on a very extensive scale, as will be gathered from the fact that they give employment to upwards of 600 men and boys. The granite is in the first instance dislodged by means of blasting with gunpowder. Deep holes are bored or jumped into the rock with an iron bar, and charged with powder, which is then exploded by means of a slow fuse. The blasts are so arranged as to be fired at meal times, when the men are away and out of danger, while a warning flag is then exhibited at the entrance of the quarries. A strong rope netting is occasionally fixed over the charge to intercept the flight of small pieces of rock, which are sometimes thrown off to a considerable distance, instances being on record of their having fallen in the village at the foot of the cliff. The chief trade of Mount Sorrel consists of setts or squared stones for paving or pitching roadways and pavement crossings, and broken stone or macadam for road-making. After the masses of rock have been detatched from the face of the working, and rolled down to the floor of the quarry, the large stones are reduced to a workable size by shotting them down, or splitting them up by small charges of powder of from two to three ounces in weight. The rough blocks are then wheeled across to the sheds of the squarers. These sheds or huts are arranged in rows, with their open sides towards the rocks, to facilitate the supply of stone. In each compartment are several boys working, under the guidance of a man. Often a family works together, the father and his children, who by a proper division of labour can work more economically than the same number of adults. The setts used in different parts of the country vary considerably in size. They are quoted by their dimensions in inches, as 3 × 6, 4 × 4. The first figure being always the smallest measure across the surface, and the second representing the depth the stone is inserted into the ground. The length of the sett is a variable one, but it should not as a rule be much greater than its depth. The stone after it has been shaped, is paid for and sold by weight. Most of the work at these quarries is done as piece-work, and under a former management it was usual to pay the men on a measured estimate of the amount of work they had got through. This gave rise to many abuses, and some of the workmen managed to get considerably overpaid. They contrived this by building up their stone heaps with hollows and empty paces in the middle of them. These, when they came to be measured, represented of course, a much larger tonnage than had actually been wrought, and the accounts of some of the workmen were thus very much overdrawn. This difficulty has now been removed by weighing weekly the work of each man, which work is loaded for this purpose in small trucks under the supervision of a foreman, and removed when weighed to a separate stoneyard belonging to the company, where the different sizes of setts are piled up in distinct heaps. The hammers used by the men engaged in squaring or shaping the granite are of several sizes. The largest and heaviest, which weighs about 28lb., is called a big burster ; it is square on one face and obtusely pointed on the other, and is used for splitting the irregular-shaped blocks into pieces of about the proper thickness for setts. The other sizes of hammers, varying from 28 to 2lb., are called as follows : Little burster, big chopper, little chopper, nobbing hammer, big sledge, little sledge, peck and hack, and squaring hammer. The lump of stone, after having been roughly chipped into shape is dressed over with a light hammer, the squaring hammer, and as a final process, to remove any small lumps or inequalities, the hammer called the peck and hack is used. This work is performed by boys, and as the result of each blow is a whitish bruise on the stone, the effect of the final dressing is commonly only a few white marks wherever the stone happens to be lumpy. Besides the regular shaped setts there are what are called randoms of about 4¼ by 5. These randoms are more carefully finished than the name implies, and are used for second class streets in many large towns, for stables, etc. To the northward of the works is a long bank of broken stone, where the men are engaged in hand-breaking. Most of the breakers are old and decrepit, and from this it may be inferred that this work commands a less rate of pay than squaring. The breakers employ a small short-handled hammer, and hold an iron ring in their left hand. This they use to rake out the lumps of stone on to the blocks on which they are broken. Stone is sometimes broken for road metal with a whip hammer. This is a light hammer, with a long pliable hazel handle, with which the workman hits the lumps as they lie upon the heap, and dispenses with the use of a block. The stone is broken nominally to pass through rings of a certain size, the common diameter being 2¼ inches. Macadam, who quarried for his famous roads at a pit still shown at Gruby near Leicester, is said to have fixed as a gauge for the size to which the stone was to be reduced the lump which it was possible for a man to put into his mouth. It would seem, when we look at the long line of men occupied in breaking, that the work could be as well done by machinery. This, however, is not entirely the case; nevertheless, a large quantity of stone is broken by steam power at Mount Sorrel. The company possesses two of Blake's stone-crushers, with which as much as 120 tons a day can be broken the size to pass through a 2¼in. ring. The shafts, jaws, and other portions of the machines have had from time to time to be strengthened and made heavier in order to resist the tremendous wear and tear of this hard granite. It seems still an open question whether Blake's machines or the toothed rollers turns out the broken granite in the best condition ; the former have certainly the disadvantage of producing a larger percentage of dust and small lumps, but the stone is more uniformly broken. The rollers, on the other hand will, I believe, do the work more cheaply, and the wear of the machinery is more regular. Perhaps the main evil of machinery is the quantity of dust and small stuff which it produces, but this is always screened out of the macadam, and commands a ready sale as granite gravel for making paths and drives. The counterbalancing good of machinery is that it tends to keep down prices and to check any attempt on the part of the men to combine against the company when work and orders press. In addition to these granite-breaking works there is a very complete range of shops where the railway trucks for the conveyance of the granite are manufactured, and where the hammers and tools for the men are turned out in large quantities. In a room adjoining the smiths' shops are stored upwards of twenty tons of hammer heads, and it is computed that about eleven tons of bars and hammers are constantly in use. From the works to the Midland Railway a line about a mile in length, crossing the river Soar by means of a magnificent brick arch, has been constructed by the company. There is also canal carriage by the Soar to all parts of the kingdom. On the banks of the canal an ingenious contrivance has been erected which deserves notice. It was formerly the practice to load the boats by bringing down truck loads of broken granite and tipping them over a high bank into the barges. When boats were waiting to load this was a work taking some considerable time. To obviate this evil a vast V-shaped hopper has been constructed, the bottom of which is furnished with iron doors or shutters. Into this hopper the truck loads of stone are shot, and when it is full a barge can be brought up and moored under the shoot, and filled in a very few minutes by opening the iron doors.

It is impossible in the limits of the present paper to say much about the methods of using granite in road-making. The numerous complaints about the roads during the last few years have brought this subject prominently before the public, and much has been said and written upon the best methods of dealing with the difficulty. As to the relative durability of paving and macadamising there can be no two opinions, for, making allowance for the great expense and trouble of pitching, and for its far greater first cost, when we estimate the frequency of repairs needed by the macadam, and the time and trouble required in the scraping and cleaning, the advantages of the former plan, especially when the traffic is heavy, are self-evident. The wear of the setts occurs chiefly at the sides and edges, causing the upper surface of the stones to become rounded, and in course of time almost conical. As this wear occurs in some stones more than in others, the face of the road becomes very uneven ; this gives rise to jolting of the vehicles which rapidly splinters the adjacent setts and, ruins the pitching. Directly a sett shows signs of wear it should be taken up and redressed *i.e.* the rounded surface knocked off and the stone laid down level with the surrounding surface. In macadamised town roads the increased width of the roadway and the altered character of the traffic does not tend so much as in the country to the production of ruts, but rather to the formation of depressions and irregular patches of loose granite. If these places are not quickly attended to, the evil goes on increasing, and the whole roadway is soon unfit for traffic. Road-mending is quite as important a consideration as road-making, and several papers have been recently published upon this subject, more especially having regard to the use of steam rollers for the purpose of consolidating the new metal. I think it is now generally admitted that rollers beyond 15 tons in weight are inexpedient. No end of mischief has been done with the 30-ton rollers in some places, such as crushing in cellars, gas and water pipes, and even sewers. After all, rolling is a very slovenly way of consolidating the macadam, and the bulk of the evidence goes to prove that excessive rolling does more harm than good, crushing and bruising the granite, and leading to the use of much more material than is absolutely necessary. The true way to mend roads is to put on as little stone as possible, and to consolidate it by means of hand ramming. I feel I cannot do better than give a wider circulation to a portion of the annual report of Mr. W. H. Wheeler, the surveyor of Boston, Lincolnshire, as, from his great experience and his practical knowledge of the subject, his observations carry especial value. After stating the fact that granite is by far the cheapest material that can be obtained, he says:—"From experiments made with one of Howard's dynamometers, I found that the traction on a road prepared with gravel in the usual way in winter time was 256lb. for a waggon with 3in. wheels loaded with stone, the total weight being 2 tons; whereas on the roads which had been repaired with granite for three or four years previously, the traction was only 108lb.; or, in other words, a horse can in bad weather draw on a granite road more than double the load that it can on one of the ordinary gravel roads of this district. In putting the new granite on the roads of this district, I have, instead of covering the whole surface with the broken stone, leaving it to be ground in with the wheels of the carts and the horses' feet, and for a time rendering the road almost impassible, adopted the system of filling up the ruts in winter time as fast as they are made. By this plan the period at which the whole surface of the road becomes hard is delayed, but at the same time it is never rendered unfit for traffic, and the stone becomes incorporated with the rest of the material without being crushed or broken, and in the end makes a better surface. Another point to which I have paid special attention has been the form of the surface and the drainage. By raising the sides when the road is too convex and forming proper water-tables, the road is kept much drier and firmer, and although it has taken a greater amount of labour at first, the cost will be more than repaid by the saving of material and the future cost of keeping the sides of the road free from grass and mud.

"Before concluding this report I cannot help referring to the practice which exists with the drivers of carts and waggons in this district, of keeping in exactly the same track, whereby the wear is all brought on the same part of the road instead of being equally distributed over the surface. This practice renders it extremely difficult, in fact, in wet weather almost impossible, to keep the road level. If the passing traffic were spread all over the road instead of being confined to one track, the cost of maintaining the roads would be very considerably reduced."

The accompanying table, which has been drawn up under the direction of Mr. C. H. B. Hambly, the Manager of the Mount Sorrel Granite Company, and which has not, I think, before been published, may be of use to some of your readers:—

SETTS.

Size.	1 ton will cover	Chiefly used for
Wide. Deep.	Square yards.	
2″ × 2″	10	Footpaths Crossings Stable yards
2½ × 2½	8	
2 × 3	7	
3 × 3	7	
3 × 4	5	Street paving quick traffic
3 × 5	4	
3 × 6	3¼	Highly dressed street paving
3 × 7	3 or 32 lin'l yds	
3 × 8	2½	
3½ × 6	3¼	Street paving
4 × 4	4¾	
4 × 5	3¾	
4 × 6	3¼	
4 × 7	3 or 25 lin'l yds	Street paving heavy traffic
4 × 8	2½	Heavy street traffic or channel stone
4 × 9	2¼ or 18 lin'l yds	
5 × 6	3¼	
6 × 8	2½	
Jacks	7½	Causeways and crossings
Randoms	5½	Railway goods' yards, Back streets, etc.

Kerb Stones.

Size.	Foot run to the ton.	
Wide. Deep.		
6 × 9	36 Rough	Edge stones.
5 × 10	40 Dressed	
6 × 12	38 ,,	
8 × 6	42 Gutter stone	
	Made also circular.	
12 × 6	28 Rough	Flat kerb and tram.
12 × 8	20 Dressed	
12 × 10	18 ,,	
15 × 10	14 ,,	

1 cubic yard of Mount Sorrel granite about two tons.

SCIENCE IN ARCHITECTURE.

By WM. PARSLOW.

(*Concluded from page* 13.)

MARBLE.

WITH reference to this material for lavatories, wall linings, chimney pieces, &c., it is surprising at first to observe the difference in prices of articles from different works. Chimney pieces, &c. sent over here direct from Belgium re, as a rule, much cheaper than those that can be bought from marble works of any standing in England; but the difference, as it appears to me, arises mainly from the less amount of labour bestowed upon the polishing. I have known frequent cases where chimney pieces brought direct from Belgium have had to be polished again within two years, and the expense of this second polishing necessarily makes the articles in the end very costly. Although I do not know the exact method of polishing adopted by the Belgians, it seems evident they depend more upon a quick dry polish and chemical process than the slow laboured style of our English marble masons. The English plan is to grind and form the surface of the marble by means of wet friction, which is much slower than dry, and does not injure the marble, while dry rubbing does, by making it softer; this process is repeated with three or four different stones in order, and then the surface is glossed with lead and felt. This genuine English plan is superseded in some marble works, and doubtless in Belgium, by dry rubbing—a quick process, but one destroying the hard surface of the stone. The glossing operation is then performed, not by rubbing with lead and felt, but by pouring on the marble some such chemical as spirits of salt. This is so strong, that when passed upon the marble it produces a hissing sound, and must necessarily soften the surface; it then receives a slight rubbing, which soon occasions a polish; but this may be detected from the genuine English polish by a peculiar deadness; in course of a few years this polish disappears and requires reviving; the true polish lasts for a generation with ordinary care.

This chemical wash, but without the dry rubbing, is the English mode for polishing carved work; the ordinary rubbing would destroy the spirit of carved marble work; it is therefore simply tooled, or, at other times, sanded, and then washed with spirits of salts; the consequence is, all English carved marble work has rather a dead look, but this is not objectionable; it soils in the course of a year or two, but may be restored by a washing of American potash or chloride of lime. The Italian marbles, as they are called, most generally used in England, are the black and gold, the dove, Bardilla, which is like black and gold, but inferior, also the statuary, the vein, and Sicilian. Lately, the Irish marbles have been freely used in England; there are four sorts, red, green, black and the fossil, a dark colour. Of the Belgian marbles, the St. Anne's must be classed among the best. The Belgian black is a very inferior article, and not equal to our common Derby black. All marbles are more or less rotten, that is, they are composed of so many parts that they have a tendency to come to pieces; the more beautifully they are marked, the more rotten they are; the various marks show the junctures or formations in the marble that produces this quality. For this reason, marble, if intended to be worked as a pillar and to bear a weight, must be carefully erected; if out of the perpendicular, and supporting much weight, it is liable to snap at some of these formations. The black and gold marble, though one of the most beautiful, is one of the most rotten, and when polished is exceedingly susceptible to scratches and snips. The Italian dove and the Belgian S. Anne's are the most durable dark marbles. The Italian statuary, though a very beautiful marble, is soft. The vein and Sicilian are more durable, and will consequently resist dust better. The Irish marbles are equal to the Italian in quality; but they are less expensive on account of the cheapness of Irish labour.

Inferior marbles may be told by blotches and other faults, and, by being soft, they will not bear a fine angle. In less than a month after working, inferior light-coloured marble work will look black at the corners, which blackness cannot be wiped off. In good hard marble-work any such soiling will wipe off. Dark-coloured marbles are very rarely soft.

LIVERPOOL MASONRY.

As a rule, the white sandstones about Liverpool are not hard enough for steps; they stand the weather well, and harden with exposure, but they do not answer for any hard wear. A crust forms upon the stones by exposure so hard as to make a difficulty in using the chisel; but this crust is continually wearing off when these stones are walked upon; they answer well for cills and weatherings, but not for steps. The white Woolton is the principal exception to this rule. The red sandstones are generally hard, and have good wearing qualities. The Runcorn stone is mostly soft, and the red sandstone steps that wear out so quickly are generally from that locality. The Tranmere and Woolton red stones are the hardest. The damp that may frequently be seen under stone cills in new buildings does not necessarily arise from bad workmanship; it generally results from the skin of the stone having been taken off by working, causing the water to find its way through the cill stone to the wall underneath; in course of time, as the hard skin grows on the stone again with exposure, this damp will disappear. The difficulty of damp passing through window cills may often be remedied by giving the top two or three coats of good oil paint. A hard skin cannot grow on the cills while servant girls are allowed to rub them continually with red sandstone.

The red granite from the Isle of Mull, and the grey granite from Dalbeatie, may be safely specified for good work in Liverpool, while for monuments and other sculptured work the white manganese limestone has hitherto proved the best.

TIMBER.

With reference to the timbers used in this neighbourhood, spruce from S. John's or Quebec is good bearing timber, but when it does give it breaks clean; it snaps off very short. The fibre of the wood is short. Spruce curves and twists very much, and often the cracks we see in plaster ceilings are to be attributed to the twisting of the joists and spars, and are not the plasterer's fault. On the Eastern coast, Baltic timber has hitherto been used for the purposes for which we use spruce, and now, on account of increased facilities for importing Baltic timber, it is becoming more generally used in Liverpool. Baltic red pine is one of our best bearing timbers, and stands the weather well when used for outside purposes; its fibre is long, and it will bend rather than break quickly. Pitch pine, besides being most useful for finishings, is good for outside purposes, and stands the weather well, but occasionally the hot sun will bring out the resin, which runs down the wood, taking the paint with it; this makes it less desirable, on the whole, for outside purposes than red pine. Baltic white is a very nice wood, and looks well in floors; it is not so good for bearing purposes as the red; the knots in the white are often what are called pin knots, small and black; they dry and drop out. The knots in the red are larger but sound. Baltic timber is often disfigured by a redundancy of knots; these do not militate against the wood, and often would not appear if the logs were cut up with judgment. A skilful workman can so cut through the knots that they do not show, simply by studying the way they run, and cutting through the feather of them.

Quebec is a superior yellow pine to that from S. John's; in the rough it is clearer, and when cut up is finer looking. If a piece of S. John's yellow pine be rubbed it will occasion a very fleecy surface; that from Quebec has less of this quality, and is often free from it altogether. Good S. John's and Quebec, however cannot be distinguished by any but experienced judges.

The best Spanish mahogany to specify is that obtained from the city of S. Domingo; this is the most beautifully marked. That from the country of S. Domingo is an inferior sort. The Bastard mahogany and the Bay wood are also inferior sorts. The Bay wood, of which we make such use, comes from the Mexican coast.

In French-polishing mahogany, polishers, if not well watched, will often lay a ground of red lead, whiting, and plaster of Paris, then polish on top of this; this makes the work easy, which is otherwise very laborious. It, however, hides a great deal of the ornamental figure, and the polish quickly disappears. If ever this process is detected, the best plan is to have the whole taken off with American potash, and start afresh. Fine polishing is accomplished only by means of laborious rubbing with the different French gums in their proper order, and gradually the whole figuring on the wood becomes developed.

A peculiarity of the poplar wood, that makes it suitable for special purposes is that it will not burn; it only smoulders.

In practical joiners' work a great difficulty with men is to get them to bore their work before nailing it. I refer principally to framing, and fixing mouldings. It is a little more trouble to bore first, and if men are not constantly reminded, they will neglect this in good joiners' work as well as in common. If there is no bore made first, there is a great tendency for the nail to slip off the stile into the panel, and the result is, if the panel shrinks at all, it takes the moulding with it and leaves a slovenly finish.

Extra attention is becoming necessary to these particulars, for, according to appearances, it is probable the principal work for joiners will eventually be fitting, since all work may in course of time be made by machinery.

At present English machine work is not of that finish that will admit of its being used universally, but most of the foreign work has a very fine finish, and there is no doubt English machinists will before long be able to equal if not surpass this, and then I cannot see what objection there will be to machine work generally. At the present time the cost of machine work is not reduced to what it might be; so much of the tree has to be cut up before a proper grain for machine work is obtained that considerable waste results. When this difficulty is better understood, and the portions of the timber that cannot be adapted to machine work more successfully utilised, then the cost will necessarily be reduced. The portions of the tree where the branches unite, causing a cross grain, interfere now with the successful working of the machines, and occasion the waste.

Of those portions of joiners' work that cannot at any time be made cheaper by machinery, the rebated sashes are a good illustration. Although these are frequently made by the machine, the result is not satisfactory; being run in long lengths they do not cut well for morticing, and there must be a considerable amount of piecing before they are completed; this makes them almost as costly as handmade work, and not so satisfactory.

IRONWORK.

Architects often specify the cold blast iron, and do not get it. The same with the Low Moor iron. The Low Moor iron from this county is the best wrought iron we can get; it is an extremely expensive material, being very hard to work; the expense per ton wrought is double the expense of iron wrought from Sheffield, Warrington, the Clyde, or any of the ordinary black countries. I do not think it wise to specify Low Moor in the ordinary way; instead of £24 per ton we may be charged £50, and after all not get what we pay for. For most purposes ordinary iron will answer equally with Low Moor, if a little thicker material is used; but where small size is required and great wearing power, of course Low Moor is best. In bolts, for instance, that do not wear much, if 1in. of Low Moor iron be strong enough, then make them of ordinary iron 1¼in. thick. By specifying these you save the extra charge, besides avoiding the risk of having 1in. bolts of ordinary iron put into the work, which might prove too weak. Low Moor iron is more malleable and tougher than the other; it has long fibres; the difficulty in severing it is the best means of testing it; its parts have to be literally dragged asunder. Cold blast iron from the various depots in Wales is the best class of cast iron; and as it is difficult to drag the Low Moor into pieces, so it is difficult to break this. I have myself broken ordinary pig with one blow from the hammer, but cold blast iron will sometimes bear twenty blows from a smith without breaking. The difference between cold blast and ordinary cast iron is more easily seen than that between Low Moor and ordinary wrought iron. When cold blast is placed besides common iron it has a bright look, while the common has a dull, dead appearance. But as a rule it takes experienced men to detect these metals from the common iron; it is, therefore, well when they are required for special purposes to specify an amount for them, and take special means to get the work done.

IRONMONGERY.

The numerous qualities of ironmongery fittings necessitate the most careful attention on the part of the architect. As a rule, good class ironmongery may be told by its finish; if the finish of an article is workmanlike and satisfactory, it may generally be concluded that the hidden portion is good; but if there is a rough and uneven finish, a tendency to snip and get out of order, then it is well for the architect to pay attention to the hidden work, as the article is not likely to be first class. Common sash fasteners, having an effective appearance, often surprise the houseowner by breaking off when more than ordinary pressure is applied; an examination will usually show these to be of hollow metal instead of solid. If we specify solid articles, and see that we get them, we may be generally assured that the rest of the work is good. In order to secure good locks, bell pulls, or door furniture, the best plan is to allow a price and arrange specially for the purchase of these articles. Handles coming off is a constant source of annoyance to houseowners, and they take for granted when this occurs the furniture must be jerry, whereas the best furniture is liable to this difficulty, and unless Pitt's or Walker's patents are used, I do not see how, with present appliances, the evil can be altogether avoided.

Bellhanging is of ten a source of trouble to the architect. No. 16 copper wire is a good strength, but difference of opinion exists on this point. Fault is sometimes found with the putting two or three wires in one tube; this need be no drawback; the difficulty is when the tubes in which the wires are put is too small; a ⅜in. tube, or even a ½in. tube, will admit of three or four wires working satisfactorily. The cause of bells ceasing to ring properly a few months after the building of a house is often very excusable, though the circumstance in some minds stamps the work as bad. The bells having been put in while the materials of the house are in a green state, they are liable to rust, and in some localities more than in others. The iron portion of the crank rusts and loosens the wires. These, therefore, require a little attention when this occurs, which good bellhangers are willing to give; indeed it is well to require bellhangers always to keep their work in order for six months.

GASFITTING.

A fruitful source of jumping in gas, when there are not the usual irregularities of defective workmanship, is the following :—¼in. piping is fixed instead of ⅜in. or wider, the consequence is, when the gas passes through the pipe of the kitchen or other warm apartments it becomes rarefied; it then ascends to the colder apartments, and through having been heated, is condensed into water; it then by its own weight falls down the pipe. If the pipe were wide enough, say ⅜in. or ⅓in, then the volume of water thus formed would, because of its own weight, have sufficient power to pass through the pipe to the proper syphon or meter, where it could be let off at will; but the pipe being only ¼in., the volume of water thus formed has not sufficient weight to make its own way down the pipe, and the force of the gas coming up is sufficiently strong to show a balance of power, the gas pressing upwards and the water downwards proving in turn the stronger.

On account of this tendency in gas to become rarefied in warm apartments, and the more easily condensed into water afterwards, a meter ought never to be placed in a kitchen or other such like place; the colder the apartment the better; the pipe ought never to be less than ⅜in. for the reason named, and even this size without a good fall is liable to occasion jumping. All gas is liable to form into water, and as it passes through cold regions it invariably does so to some extent. for this reason large syphons are provided in the streets, and a great deal of water may be seen taken from them at times, being merely condensed gas. All gas is liable to frieze; on being made it passes through water; hence it is damp to begin with. Frozen gas need offer no serious difficulty, if the pipes are large enough, and have a good fall to a syphon. By the application of warmth it will melt into water, and then pass away.

Similar notes upon the remaining branches of an architect's specification will constitute the second part of this paper.

◆

ALTAR WINDOW, S. PETER'S, HAMPTON LUCY.

CONSIDERABLE alterations have been made in the Church of S. Peter, Hampton-Lucy, since the altar window which we illustrate was erected. Instead of the former altar window, Mr. G. G. Scott has built a beautiful apse with five large windows, which contain all the subjects and coats of arms which occupied the window shown, the intermediate space being filled with glass. The whole character of the church, is indeed, greatly altered since Rickman's day. The stained glass window, in its original state, was presented to the church by the present rector, the Rev. J Lucy, M.A., and was designed and executed by Mr. Thomas Willement, of London, F.S.A.

In the compartments of the tracery within the arched head of the window are introduced the A Ω I. H. S., and the Dove, as indicative of the three Persons of the Blessed Trinity; and also the Angel, Lion, Calf, and Eagle, as the emblems of the Holy Evangelists. The remaining divisions are occupied by foliage ornaments. In the centre opening of the lower part of the window, under a rich Gothic canopy, stands the whole-length figure of S. Peter, to whom the Church is dedicated, the pedestal being inscribed with his name.

Immediately beneath this figure are placed the impaled arms of King Philip and Queen Mary, by whom the advowson of the rectory was given to Thomas Lucy of Charlecote, Esq., afterwards knighted by Queen Elizabeth. Below these, beneath a mitre, are the arms of the diocese of Worcester. The three openings on the right and the three on the left are occupied by eighteen compartments, each beneath a Gothic arch, the upper six having pedimental canopies, containing the principal events in the history of the patron Saint. The lower range beneath these subjects consist of six compartments, each containing the figure of an angel holding a shield of arms.

DOMESTIC HYGIENE.—THE KITCHEN RANGE.

AMONGST all the fittings of a domestic residence, it may fairly be asserted that none are so important to the comfort of the inmates, or at times more conducive to their discomfort, than the means and appliances employed for warming the building. What more delightful than the winter fireside of a country house? or more miserable than a smoky chimney? The whole subject of fireplaces, chimneys, and fuel, is indeed, so far as the householder is concerned, all one, though it requires to be considered under several heads; we shall also show, in due course, that economy and the healthiness of a household are intimately connected with the same question. As, however, it would be impossible to treat on the several heads enumerated above in one article, we propose first of all, after a few introductory remarks on chimneys, to devote our attention to the kitchen range, as being unquestionably the most important fireplace in any house.

Now the use of chimneys being, primarily, to carry away the products of combustion; and secondarily, for purposes of ventilation, the subject must be considered in both these lights. With the huge wood fires of our ancestors, the large hearth recess and the capacious flue did not interfere with the accomplishment of the object proposed; but when fireplaces were introduced into small rooms, and coal was substituted for wood, the arrangements which were suited for the baronial hall or kitchen did not apply. Five hundred years of experience in chimney construction does not appear to have resulted in the deduction of scientific rules for their apportionment, so far as houses are concerned. In this respect architects have unquestionably been left far behind by engineers, who, when they desire to erect a chimney shaft for a factory or steam engine, carefully apportion the dimensions of the structure for the work which it has to perform; it is, however, too often the case that flues in houses are constructed of the same sectional area, whether they be twenty or fifty feet in height; whereas dimensions that may be suited for the one height are perfectly inappropriate for the other. One consequence of this is the disfigurement of buildings by the addition of chimney pots, for the purpose of contracting the orifice of a flue which has been constructed too large for the duty it has to perform. Defects arising from this cause are too often attributed to the position of doors or windows; whereas the real reason of their existence is assignable solely to the entire absence of any calculation for determining their proper proportions. Something, it is true, may be said with regard to the setting of fireplaces, as well as to their construction; but we do not purpose to enter into this question in the present article.

Perhaps one of the greatest treats that a cook could enjoy is to be served with a dinner cooked by some one else. The reason of this is that the constant smell of cooking nauseates the stomach, making it, by the sympathetic action of the several nerves of the system, disinclined to receive what it has so long anticipated through the action of the senses. Similarly, also, the mistress of household enjoys nothing better than to get some one else to superintend the ordering of her several meals. But if this is caused, to a certain extent, by a mere knowledge of what is coming, how much more must it be the case when the smell of cooking—as too often occurs—pervades the house as well as the kitchen; and in some instances the smell of dinner will be perceivable in other parts of the house to a greater extent than in the kitchen. To a delicate person this is sufficient to entirely destroy the appetite, and it is due solely to defective construction. The cook is too often blamed when the architect is in error; and while few know where to assign the fault, fewer still know how to remedy it; but it may be taken for granted that the evil will not disappear from amongst us until the art of house construction is based upon a more scientific principle than it has hitherto attained. Art and decoration, and the convenient arrangement of accommodation, occupy, in the present day, far too much of the consideration of the architect; whilst sanitary arrangements are neglected, and the healthfulness of buildings suffers in consequence.

In order to arrive at a true appreciation of the causes that lead to the kitchen being a nuisance in the house, instead of, as it should be, the means of imparting pleasure and comfort, we must consider first, what is a smell, and how it is conveyed. A smell then—and here we are referring, it will be understood, to a smell that ought not to exist—is matter in a wrong place, and consequently it is *dirt;* and not only is the smell of cooking when it pervades a house, dirt in a scientific sense, but it so absolutely. The smells arising from cooking cousists of minute particles given out from food of all kinds, owing to the partial chemical decomposition which takes place during the application of heat, and which are carried off and mixed with the surrounding air by the steam, or other vapours arising therefrom. With a properly-constructed kitchen range and flue, these will all be conveyed up the chimney, and carried away into the atmosphere above the house. In such case they are harmless, and become immediately, so to say, deodorised, by admixture with a preponderating amount of atmospheric air. When, however, they are permitted to escape into the house, they do not meet with a sufficient quantity of air to render them innocuous; and, upon condensation of the vapours by which they are conveyed, they will settle upon the interior walls, and gradually cover them with a coating of grease and vegetable matter. These, if not constantly removed, will accumulate, and in time decompose, giving off still more objectionable and unhealthy smells, but which are not so noticeable, in consequence of the more powerful odour arising from a continuance of that evil from which they first had their origin.

It will repeatedly be found that the smell of cooking is strong in other parts of the house, and especially upon the floor immediately above the kitchen, whilst the kitchen itself is apparently free, or almost so—from the inconvenience; and the reason of this is, upon a little consideration, made perfectly clear and intelligible. We shall endeavour, in our next article, to explain the cause and then point to the remedy; for to whatever extent the evil may exist, its modification—if not its entire remedy—is simple, however defective the kitchen chimney and range may originally be. —F. C. Danvers, *in the Food Journal.*

THE PRESERVATION OF ANTIQUITIES.

DURING the visit of a party of archæologists to Silchester the other day, mention was made of Lord Romilly's desire to pass an Act of Parliament for the maintenance of our national antiquities ; it seems that in many cases the owners of the soil are unable to prevent their destruction, or utterly careless about it. There has recently been a correspondence in the *Times*, too, complaining of the desecration of ancient memorials in the village of Dorchester, 9 miles from Oxford. It was stated at Silchester that Stonehenge is greatly injured by parties who make fires under the massive megaliths, and knock off fragments of stone as curiosities. Now Stonehenge, which a contemporary takes to have been a royal palace in days before either Iberians or Celts trod the soil of this island—the palace of a perished race and an extinct civilisation—is probably the most mysterious and the most durable monument on the face of the earth. Petra—

> That rose-red city, half as old as time—

is modern in comparison with it ; and it will be scarcely altered, if the vandals are warned off, in days when the great cathedral of Sarum will be a grass-grown mound, and when not a landmark will exist to show the irrepressible New Zealander where stood Sir Charles Barry's triumph of confectioners' Gothic. It is to be hoped Lord Romilly will bring in his Act, and the earlier the bette.r

VENTILATION OF HOSPITALS.

A COMMITTEE of the Paris Academy of Sciences is now considering this very important subject, and a communication from M. Cornill Wœystin has just been presented and referred to this committee. M. Wœystin criticises the present method of ventilation of hospitals, and asks how it is that while certain doctors assert that a supply of eight to ten cubic metres of air per bed and per hour are sufficient to keep a ward in good conditions of ventilation, others insist upon a supply of twenty, and even sixty, cubic metres, while some even fix eighty as the minimum quantity. He accounts for these immense discrepancies in the following manner :—In a ward containing, say, ten beds, the warm air is introduced between two ranks of beds by means of five orifices in the cent a passage while the vitiated air is drawn off through other orifices behind the beds. Thus, says M. Wœystin, a number of currents are formed from the inlets to the exit passages, which do not sufficiently draw away the intermediate layers of air, and thus cause many regions or currents of air not sufficiently ventilated, which become veritable reservoirs of infection ; and this he believes to be the true reason of the increasing demand for a larger amount of fresh air. The introduction of a greater quantity of fresh air, according to M. Wœystin, only increases the rapidity of the currents, and has little effect upon the strata of air which lie above and round them, between the inlets and the ports of evacuation ; the object, therefore, should be, not to introduce masses of air, but to make better use of that which is admitted. To remedy this, M. Wœystin suggests the application of a well-known system—that of wire-work, or gauze ; he recommends that the orifices for the introduction of fresh air should be covered by such a screen, reaching from the floor to the ceiliug, and that the exit holes should be protected in like manner, so that the movement of the air should be graduated and dispersed over the entire contents of the ward. The importance of this question cannot be overrated ; all the world knows what relief has been obtained of late years in the case of fevers by a free use of fresh air, and the subject has been tested in a very remarkable manner in France, both in towns and in camps ; patients have been placed under tents where the supply of fresh air was constant, and the temperature low, with an amount of success that gives immense importance to such experiments. It must not be forgotten, however, that draughts do not supply wholesome ventilation ; and the shutting off, or rather the attenuation of them, must conduce to the comfort and well-being of the sick.—*G. W. Yapp.*

ARCHÆOLOGICAL.

Discovery of a Roman Tesselated Pavement.—At Oldcoates, on the site of the Manor yard, has been excavated a Roman tesselated pavement, remarkably perfect. The tesseræ, which are of limestone and red sandstone, are half an inch square, and are set in cement with great skill so as to form diamonds and circles. Some Roman tiles have also been found.

Prehistoric Remains of Dartmoor.—Mr. C. Spence has presented an interesting report to the Ethnological Society on the Prehistoric Remains of Dartmoor, detailing the numerous stone circles, avenues, menhirs, cromlechs, cairns, &c., and suggesting that the stones in some avenues may have been added in commemmoration of persons of distinction. The granite blocks in some of the cromlechs appear to have been wantonly destroyed.

Discovery of Extensive Ancient Mines in the Eastern Counties.—For more than two years, at intervals, the Rev. Canon Greenwell, of Durham, has been conducting a series of investigations as to the nature of a large group of circular pits situate near the town of Brandon, in the Valley of the Ouse. The pits in question are known as the "Grimes Graves," and the country around them abounds upon the surface in flint implements and flakes, and most numerously near the pits or "graves." The "graves" have, in fact, proved to be the shafts (in which the filling-in materials have settled) of extensive underground flint mines, to which the shafts are upwards of 200 in number, and generally about 25ft. apart. The old shafts appear to have been successively filled up by the *debris* from the new ones throughout the group, which having settled, they now present the appearance of bowl-shaped depressions, about 4ft. deep, and have been variously regarded as graves, villages, &c. The laborious work of sinking the shafts, excavating the galleries, and getting up the flint had been done by picks made of the antlers of the red deer, of a larger species than that now found in Scotland. Throughout the workings only one stone hammer was found, and that of basalt. The marks made by it could be fitted on the sides of the chalk walls, and pick marks were abundant everywhere.

Royal Archæological Institute.—The annual meeting of the Royal Archæological Institute of Great Britain and Ireland will be held at Leicester at the end of the present month. The meeting is under the patronage of Her Majesty and the Prince of Wales, and Lord Talbot de Malahide, F.S.A., is the president for the year. Leicester itself possesses many features of archæological interest. These include its mediæval churches, the Norman hall of its ancient castle, the "newarke" of the castle, numerous Roman pavements, one being *in situ*, and the noted mass of Roman masonry called the "Jewry Wall," the ancient hall of Corpus Christi Guild, the chapel of Trinity Hospital, and the now forsaken hospital of Sir William de Wyggeston. With these may be mentioned the site of Leicester Abbey, surrounded with its original walls, where Cardinal Wolsey breathed his last. Among the features of interest which will be included in the proceedings of the week will be the inspection of Kirby Muxloe Castle, Ashby-de-la-Zouch Castle, the ruins in Bradgate-park, so intimately connected with Lady Jane Grey, the remains of Ulverscroft Priory, the curious stained glass of Woodhouse Chapel, the house known as Latimer's at Thurcaston, the noble church at Melton Mowbray, the fine Norman hall at Oakham, the interesting hall and church at Exton, and the remarkable encampment at Barrow-on-the-Hill. A temporary museum will be established, as usual, during the week, and will include a collection of portraits of worthies connected with the counties of Leicester and Rutland.

PARLIAMENTARY NOTES.

New Home and Colonial Offices.—Mr. Dudley Fortescue, on Friday, asked the First Commissioner of Works whether, as at this advanced season there was no indication of any works in progress, it was intended not to proceed during the present year with the erection of the new Home and Colonial Offices.—Mr. Horsman also put a question as to the removal of the buildings in King-street.—Mr. Ayrton replied that the building of the new Home and Colonial Office would be proceeded with as soon as the Government had given the requisite sanction for that purpose. The plans and estimates for the buildings were under the consideration of the Government, and he expected their decision in a few days. With regard to the property lying between these proposed buildings and Parliament-street, he might say that the purchases had not yet been completed, and several houses were specially occupied for short terms. There was no intention to pull down these buildings until the new buildings were in such a state as to render it necessary. These buildings were not purchased to improve Parliament-street, because improvements of that kind must be carried out by means of the local funds.

Thames Sewage.—Mr, James Howard asked the First Commissioner of Works on Monday whether the effect of the Thames Navigation Bill, as amended, would not be to throw upon the same body of ratepayers who already bear the expense of pumping the sewage of London into the Thames, the further expense of dredging it out. And whether he would state the reasons, if any, why he did not call upon the Metropolitan Board of Works to enforce the carrying out of the contract made between the said board and the Metropolis Sewage and Essex Reclamation Company for the diversion from the Thames of the sewage of the northern area of the metropolis, which contract was confirmed by the Act 28 Vic., c. 121, intituled "The Metropolis Sewage and Essex Reclamation Act, 1865."—Mr. Ayrton said that should the deposit of the sewage obstruct the navigation it would be removed at the expense of the ratepayers. With respect to the Essex Reclamation Company, it had not been a financial success, but Parliament would take care that the company should bear its own losses and not throw them on the ratepayers.

ASSISTANT SURVEYOR OF WORKS.—Mr. B. Hope asked whether it was true that it was in contemplation to create a new office of assistant surveyor of works, and whether Mr. Ayrton had any objection to lay before the house the conditions of appointment and the qualifications required for the office; and, in particular, whether he would state if the new assistant surveyor would be required "to design and superintend the erection of new buildings," and "should also be capable of making technical reports properly composed and spelt."—Mr. Ayrton replied in the affirmative, and that the applicants would be all examined by the Civil Service Commissioners.

THAMES EMBANKMENT.—Mr. B. Hope asked the First Lord of the Treasury what steps her Majesty's Government were taking to erect the new Natural History Museum on the Thames Embankment, as unanimously recommended by a select committee of last session, on the suggestion of Mr. Layard, then First Commissioner of Works, and with the approbation of the heads of the Natural History Department of the British Museum.—The Chancellor of the Exchequer said the report could not be carried out without taking back from the tenants of the Crown the ground secured to them by the Embankment Act, and the Treasury was not prepared to recommend its purchase.

NEW REFRESHMENT-ROOMS.—Mr. Bentinck asked the First Commissioner of Works whether he intended to propose a vote during the present session for providing new refreshment-rooms for the members of that house; whether he intended to adopt the plan which was appended to the report of the select committee of the house, dated 25th of May last, and which had been altered by Captain Galton from the plan of Mr. Barry, approved last year by the then First Commissioner of Works, and by the select committee of the House of Lords; whether he had considered the objections raised by the select committee of the House of Lords in their second report to the altered plan, and whether the altered plan had been submitted to and approved by a competent professional architect; and whether the preparation and execution of the final plan would be entrusted to Mr. Barry, or to some other competent professional architect.—Mr. Ayrton replied that the plan of the committee of last session would cost £24,000. He had, however, had a plan prepared by the officers in the department of works, which he had submitted to the select committee of this session, by which it was unanimously approved. Before they could make their report the Black Rod Committee made its report, which was now before the house, enabling them to consider how it respected the privileges of the Crown and the dignity of the House of Lords. There would be no estimate prepared until a final decision was arrived at.

Building Intelligence.

◆

CHURCHES AND CHAPELS.

CONINGTON.—The parish church of Conington, Cambridgeshire, which has been closed for the past few weeks for restoration, will be re-opened on the 26th inst. The chancel has been entirely rebuilt, and the body of the church repaired and reseated, under the direction of Mr. W. M. Fawcett, of Cambridge.

DALSTON BAPTIST CHAPEL.—The ceremony of laying the memorial stone of this chapel took place on Wednesday week. The total cost of the chapel will be about £4500. The building will be erected in the Venetian style of architecture. It will be 70ft. by 40ft. There are to be vestries, school-rooms, and every convenience.

ELY CATHEDRAL.—The restorations which were commenced a short time since in the south transept of Ely Cathedral are now in progress, and are proceeding in a very satisfactory manner. The grand old western tower is being strengthened by the introduction of a large number of wrought-iron ties, the weight of which may be estimated at 40 tons. This work is to be done in a similar manner to that at Salisbury Cathedral a few years ago, under the immediate direction of Mr. G. G. Scott, and carried out by Mr. James, of London, and Messrs. Freeman, of Ely. The nave floor has just been completed, at a cost of about £3000, and adds materially to the beauty of the building. Three more of the vacant canopies under the lantern have been filled with carved figures in stone, presented by the Bishop of Carlisle. Three more stained windows have been placed in the north and south sides of the choir. It is stated that during the last quarter of a century £40,000 has been expended upon this noble edifice.

GLOUCESTER CATHEDRAL.—Some months ago the Freemasons of Gloucestershire expressed a wish to undertake the restoration of some distinct portion of Gloucester Cathedral, and it was suggested that they should provide the new reredos, at a cost then estimated at £600. A committee was appointed by the Provincial Grand Lodge, the £600 was raised, and at a recent meeting it was ordered that a communication should be made to the Dean to the effect that "the Freemasons are prepared with the £600, the amount which they were led to believe the restoration of the reredos would cost, and are most anxious to undertake that work; but that the committee do not believe it to be possible to obtain a larger subscription." The cost of the reredos, as designed by Mr. Gilbert Scott, is expected to be about £2000.

HINTON MARTEL.—The church of S. John the Evangelist, Hinton Martel, Dorsetshire, was re-opened on Tuesday week, after restoration. The old church was entirely pulled down, but its main features are perpetuated in the new building. The external walls are of flint, with bands of local green stone. The new windows, doorways, and dressings, are of Box Ground stone. The edifice comprises nave, north aisle, chancel, and north chancel aisle, with a Norman tower at the west end. Internally the walls are lined with white bricks, relieved with bands of red brick, and the internal dressings are of Bath stone, relieved with brown and green stone. The walls are built hollow, to exclude damp. The nave is separated from its aisle by an arcade of four arches of Bath stone, moulded and springing from octagonal piers, with moulded caps and bases. The roofs are of open deal timbers, stained, and plastered between the rafters; the principals have moulded-pointed arched ribs. The roofs are covered with tiles, with ornamental ridges. The sacrarium is laid with Minton's tiles, and the carvings were executed in part by Mr. Boulton, but principally by Mr. Weaver, of Worcester. The chancel seats are of pitch pine, and the benches in the nave and aisles of deal, stained and varnished. Accommodation is provided for 253 persons. The original drawings for the restoration of the church were prepared by the late Mr. John Hicks, of Dorchester, but the work has been carried out under the superintendence of Mr. G. R. Crickmay, of Weymouth; Mr. A. H. Green, of Blandford, being the builder. The cost has been upwards of £2000.

KERSLEY.—The first steps towards the erection of the new church of S. Stephen, Kersley Moor, Farnworth, were taken last week, when the ground was marked out. The excavations for the foundation will be commenced in a few days. The site adjoins the school-room on the Manchester-road. The church will be erected from a design by Messrs. Henry and Medland Taylor, architects, Manchester; Messrs. Ellis and Hinchliffe, of Manchester, being the contractors. The style chosen is Decorated Gothic, and the church will comprise, nave, aisle, chancel, vestry, organ chamber, and a tower at the west end of the nave.

SALFORD.—A new Wesleyan chapel, situate in Regent-road, Salford, was opened on Thursday week. It has been built from a design by Mr. Webster, architect, and will seat 850 persons. The cost has been £4000.

LEITH.—The foundation-stone of a new Free Church dedicated to St. John, was laid at Leith, on Monday. The building, which is being erected according to the plans prepared by Mr. John Patterson, architect, Edinburgh, is to be of an oblong form, provided with galleries on three sides, and will be seated to accommodate 906 persons. The style of the architecture is Gothic, and the most prominent feature in the building will be a square tower, rising to the height of 150 feet to the point of terminal. Charlotte-street front is to have five windows, which will light the area of the church. Exclusive of the tower, for which there is a separate fund, the structure when finished is expected to cost over £5000.

LINCOLN.—The new church of St. Peter's-in-Eastgate, which has just been completed from designs by Mr. Blomfield, architect, of London, was consecrated on Wednesday week, by the Lord Bishop of Lincoln. The edifice contains sitting accommodation for 500 persons; it consists of a nave and north aisle, chancel, organ-chamber and vestry, with south and west porches, a waggon-head roof to the chancel, and seats of stained pine. The style is First Pointed; of a simple and massive character. The dimensions of the church are—length of nave, 8ft. 9in.; chancel, 29ft.; width, 40ft. 10in.—chancel, 22ft.; height from the floor to wallplate, 22 ft.; to ridge of roof, 42ft. The church is built of Lincoln stone, rock-faced, with dressings of Bath stone; the interior walls are plastered with Bath stone quoins and dressings. A hot water apparatus in a chamber beneath the vestry supplies warmth. The reredos is a beautiful work of mosaic decoration, representing the emblems of the four Evangelists, with those of S. Peter and S. Margaret, the patron Saints of the church, a beautiful cross in the centre, and over it the inscription "Holy! Holy! Holy! Lord God Almighty." The contract for the building, exclusive of the reredos and east window, which are private gifts is within the architect's estimate of £2500.

WHITTLESEY.—The fine old church of S. Andrew, Whittlesey, Isle of Ely, is about to be restored. The committee for the restoration have appointed Mr. R. R. Rowe, of Cambridge, to be their architect, and that gentleman is now preparing the plans and specifications necessary in the application to the Bishop's Court for a faculty.

BUILDINGS.

BAKEWELL.—The foundation stone of the new vicarage at Bakewell was laid on Saturday afternoon last. The style is Gothic, with limestone facings and Stanton gritstone dressings, and the interior fittings will be of pitch pine. Mr. A. Waterhouse, of London and Manchester, is the architect, Mr. J. Dickson, is the clerk of works, and Messrs. Thomas Clay and Son, of Manchester, are the contractors. The entire cost of the new vicarage, adjacent buildings, &c., will be upwards of £6000.

MERTON, SURREY.—On Monday last, the foundation stone of the new National Schools at Merton was laid by the Lord Bishop of Winchester. The New Schools are the gift of the late Mr. Richard Thornton, of Cannon-hill, Merton, who bequeathed £10,000 for that purpose; they are intended to take the place of the present schools, which have become totally inadequate to meet the requirements of the parish. The plan comprises boys', girls', and infants' schoolrooms, with classrooms attached to each, and also residences for a master and two mistresses. The works are being carried out by Messrs. E. B. Gammon and Sons, of Lambeth, côntractors, under the superintendence of Messrs. Aldridge and Willis, architects, of 6, John-street, Bedford-row, whose designs were selected in a limited competition, the amount of the contract, exclusive of fittings, being £2550.

NEWCASTLE-ON-TYNE.—The foundation stone of new schools in connection with Bath-lane Church was laid on Thursday week by Lord Amberley. The buildings will be entirely of stone, and in the Gothic style. The principal elevation, facing Locke-street, will present a large centre block, flanked by gables at the east and west ends. The building will be lighted by large three-light windows in the centre block, and by four-light windows in the end gables. Admission will be gained through a porch at the north-west angle, and by two side doors situate at the east end. The centre block will be surmounted by a bell turret. The school room, which internally measures 85ft. by 55ft., will be divided into centre and side aisles by cast iron columns, used as supports for the roofs, the roof over the aisles being open, and that over the nave waggon-headed in form. The height from floor to ceiling will be about 30ft. Suitable class rooms will be provided, as well as a china closet, a tea boiler room, lavatories, water closets, and other conveniences. The building will be warmed by hot water from the heating apparatus in connection with the church. The cost of the schools will be about £2000, and they will be erected from the designs and under the superintendence of the architect, Mr. T. Oliver, of Newcastle-on-Tyne, who was also the architect of the church.

PLYMOUTH.—The Town Council of Plymouth have decided to expend £35,000 on the erection of assize courts and other public buildings. Twelve firms, from Bath, Salisbury, Exeter, Plymouth, Tavistock, and Saltash, tendered, the difference between the highest and lowest being £2900. The tender of Messrs. Call and Pethick, of Plymouth, was accepted.

Rotherham.—At the annual meeting of the constituents of the Rotherham Independent College, last week, it was stated in the committee's report that a site for the proposed new college had been purchased, at a cost of £3200. Plans of the building it is proposed to erect have been prepared by Messrs. Habershon and Pite, of London, the estimated cost being about £22,000.

The Surrey Sessions House, Newington.—There is a fair prospect of great improvements being carried out at the Surrey Sessions House, Newington-causeway, which has long been found inconvenient and inadequate to the necessities of the county business. At a meeting of the Surrey magistrates at Guildford, last week, the committee upon the improvement of the Sessions House reported that the County Surveyor (Mr. C. H. Howell) had prepared detailed plans, elevations, and sections, which seemed to the committee to meet all the requirements of the county business, but the surveyor had been unable, for want of time, to obtain tenders for carrying out the same. The surveyor's report estimated the cost of carrying out the necessary alterations and additions at £13,000, not including heating and ventilating the courts, architect's commission, or salary of the clerk of works. He had ascertained that the cost of heating and ventilating the courts in the same way as at the Manchester and Durham courts would be £1000. Pending the attainment of the necessary powers from Parliament to carry out the work, the committee, while fully approving of the plans of the surveyor, suggested that no tenders should be obtained at present, and recommended that the committee should be continued from session to session in order to bring the matter under the consideration of the court when the result of the application to Parliament shall be known. The report was adopted by 15 to 6.

BATH STONE AS A BUILDING MATERIAL.

(To the Editor of The Building News.)

Sir,—In publishing a full report of Mr. Parslow's hints on specifications in last Friday's Building News, you have done good service to all interested in the building trade if Mr. Parslow treats each department of this subject with equal ability to that evinced in his pertinent remarks on Bath stone.

Most readily do we join with him in asserting that the cause of failure of the "Bath stone in Liverpool (and elsewhere) exists mainly in applying to the wrong quarries for stone for outside purposes," and that "selection" and "laying Bath stone on its proper bed has a great deal to do with its lasting well."

Bath stone is so cheap in its first cost, so easily worked, and so effective in its general appearance, that great as is its present consumption, it ought to be more extensively used than it is. The only objection urged by its opponents against its more general adoption is that it here and there fails to withstand atmospheric influences. After many years of experience, we can briefly point out how a recurrence of these few cases of failure may be avoided :—

Firstly.—For situations exposed to the weather, employ only Combe Down, from the Lodge Stile Quarries, or Box Ground stone. The former, being free from the yellow lists occasionally found in Box Ground, is superior as a weather stone.

Secondly.—As the nature of each stone varies in different localities, purchase at those quarries whose stone has been proved durable, and whose proprietors have a direct interest in the permanent success of Bath stone.

Thirdly.—Lay the stone on its natural bed.

Fourthly.—By means of a competent clerk of works ensure the employment of good stone and the carrying out of the preceding requisition ; for it is a fact that all sorts of rubbish are occasionally used under the name of Bath stone. A few months since a gentleman sent us a piece of *sandstone* taken from a building for which Bath (which is a *carbonate of lime*) had been specified. The building was decaying away ; and Bath stone, in consequence, was suffering in public estimation.

Relative to Farleigh Down, we cannot agree with Mr. Parslow that it "has no advantage to offer to Liverpool architects," for wherever it is used it gives universal satisfaction, and is most extensively employed for exterior and interior work ; its warm tinge of colour is more agreeable to the eye than the cold white of Corsham Down, and it works with greater freedom. With this exception of colour we entirely concur in Mr. Parslow's opinion of Corsham Down.

Our apology for so far occupying your valuable space is our anxiety that Bath stone may be so treated that it shall not only be considered a *cheap* and *handsome* but also a *durable* stone.

Your insertion of the above in your next issue, as a supplement to Mr. Parslow's remarks, will greatly oblige.—We are, Sir, &c.,

Stone Brothers.

Bath Stone Office, Bath, July 6, 1870.

"TENDERING WITH A VENGEANCE (!)"

Sir,—Such is justly your exclamation in publishing the tenders for the restorations of S. Sidwell's Church, Exeter, in last week's number, of which contemplated improvements my description appeared in your issue of June 17th.

(Highest)—Easton	£1740 (!)
(Lowest)—Hunt	980 (!)

Permit me to call your attention and that of your numerous readers, by way of contrast, to the list of estimates for the erection of the new Guildhall, Plymouth.

(Highest)—Hunt and Seacombe, Exeter	£57,506
(Lowest)—Trevena, Plymouth	28,989

Thus, in a week, we find the same man offering in one place to do work for half the price of the highest tender, and £414 less than the next to lowest, in a small job ; and the next day being *double* that of the lowest and £12,606 in excess of the next to highest !

Is it not such blundering ignoramuses that bring the morality of the building trade into discredit and bad repute, totally disgusting honest and respectable contractors, such as are those worked for by your Exeter correspondent,

J. V.

INDUCEMENTS FOR COMPETITION.

Sir,—Behold a *morceau* of the 19th century, circulated by certain Solons of the thriving and good old town of Nottingham! The italicising is not an interpolation, but is in the original.

"Sir.—It is proposed to build a New Wesleyan Chapel, with School-room underneath, at the top of York-street, in this town. The entire cost is not to exceed £3500 (the site excepted); this sum must include boundary walls, heating with Haydn's apparatus, if not too expensive, all inside fittings, together with architect's fees, *in short, everything, and there must be no extras.*

"The building to accommodate about 800 adults, including 100 free sittings. The exterior to be Gothic, *without spire, liberally treated.*

"A large room will be required at the rear of the chapel, on the same level, to hold at least 100, and a minister's vestry attached. Three other class rooms will be required.

"The interior to have no pillars, except for gallery supports. The pews to be of pitch pine, stained; the rostrum, or semi-rostrum, placed low, with communion in front to command the gallery and area with ease. The roof and the whole arrangement must *be carefully adapted for hearing.*

"The Committee are desirous to confine the erection of this Chapel to one of the architects of Nottingham; a few names have been selected, and if you will furnish an elevation and ground plan, on condition that, if approved, your services will be accepted as architect, the Committee will feel obliged. Please note that no compensation is offered.

"Plans, &c., must be forwarded to the Rev. J. Mason, 58, Mansfield-road, Nottingham, on or before Monday, July 25, 1870.

"On behalf of the Committee, we remain, yours &c.

"J. Mason, Ministerial Secretary,
"J. Howitt,
"Jas. Robinson, } Lay Secretaries.

"N.B.—In furnishing your estimate of cost, please state difference between Bulwell stone and brick.

"Clumber-street, Nottingham, June 29, 1870."

Truly the document has vigour if it lacks perspicuity. Upon the money part our friends are very strong. "The entire cost, including architect's fees, is not to exceed £3500," and, furthermore, must include "*in short, everything,*" and beyond this, "*there must be no extras*"! Safe people these committee men! But how about "Haydn's" (*sic*) apparatus" (Possibly he of Cromer-street is intended, and not the man of the "box of whistles;" the former will feel flattered, however.) We think the apparatus *will* be "too expensive" with the "school-room underneath." The question has evidently been a botherer for our "committee," and so is bequeathed to the "selected few." Our Wesleyan friends have, in their time, done good service to humanity, but they have not hitherto been exactly in the van in "Gothic"; we hail, therefore, with unmingled gratification, the advent of the "Gothic exterior *without spire, liberally treated.*" Now for the olive wreath, ye "selected" sons of high art! De Wykeham to the rescue! For oh! when you leave the "exterior" and get to the interior, "what a falling off is there!" a mist of "pews," "a rostrum or semi-rostrum," and "a communion (whatever that may be) to command the gallery!" (Shade of Murray!) Well, this bit is a *leetle* obscure, or, "in short," as the committee would put it, a puzzler. Well, never mind, for as Lord Dundreary says, "puthles are made, you know, on purpoth." Cheer up, for inside no "Gothic liberally treated" haunts your bewildered brains. What shall the inside be, then? Echo answers—"What?" Mr. Chunder Sen, would probably suggest Græco-Indian, with Chinese feeling, for is it not chronicled, the greatness of Confucius as a master-mason? But steady, gentlemen, the whole arrangement "*must be carefully adapted* for hearing," not a bad idea either—and another strikes us; we adventure it—also, let "the whole arrangement be carefully adapted for"—worship.

Do our eyes deceive us? "Please note that no compensation is offered!" This is too "dree" to be true, because we have a lively recollection of a ten-pounder being given, or at least offered, for a £1500 design, and if a more subdued, yet still a grateful reminiscence, of the offer of a £5 "prize" in another case. But come, come, "no compensation"! We like a *little* humour, but, "honour bright," this is stretching a joke too far; we shan't let you off without "a leg of mutton and trimmings," and liquor round.

"Plans, &c." in three weeks. Oh, they'll do double that "like winking," all of them; they've nothing to do in Nottingham, but to offer "services that, if approved, will be accepted." All right Messieurs le Comité.

"N.B."—What, isn't the the female mind at rest? What next? "difference in cost"—our "estimate"—estimates made for us—"not to exceed £3500" must include in short everything," and in addition, "no extras." Ha! ha! "difference?" Good—two and two won't make five, "no way you can fix it." Sanhedrim of Clumber-street, Nottingham, fare ye well; may your shadow never grow less!—I am yours, &c.

Leonardo De Pasquinadez.

THE ARCHITECTURAL EXHIBITION.

Sir,—I have read the criticism which appeared in your last week's number on the Architectural Exhibition, and noticed the remarks of your critic on the cartoon which you honoured by a place in your journal some weeks ago. As your critic has discovered a comic element in my drawing, he must not be surprised to learn that his own critique reaches in some points the undesirable, although proverbial, "step from the sublime." I fear that in the agony of his endeavour to say something new and clever, he has managed to stumble over the boundary of truth, and indulged in—well, call it—exaggeration. Or, if we give him credit for entire truthfulness, I must say that, judging from the abnormal wildness of his statements, and knowing that the maudlin drunkenness which he imputes to the heroes does not exist in the cartoon, I can only imagine that he unwittingly caught the reflection of his own face in the glass which covers the picture—and described accordingly.

The blue leggings (which I suppose offended your critic from their not being of the complementary colour to the verdant tinting of his own eyes) were rather fashionable in the 12th century, if we may credit the manuscripts of the period.

His remarks about the drawings of Mr. Owen Jones are chiefly noticeable from the lugubrious way in which he forms himself and his co-believers into a peculiar people, distinct from "the world," and also for the charming liberality of sentiment which sees in Mr. Owen Jones's drawings only "costliness without art," a belief which bears a strong resemblance to that of the Ranter, who could see no religion in any creed in the world save his own.

In one of the drawings favourably noticed by your critic, and attributed to me, I do not recognise in his description any features of my own work, and fancy there must have been some mistake in the numbering; but as I have not been able to visit the exhibition to see whether or not this was actually the case, I can only meantime disclaim any desire to appropriate commendation due to somebody else.—I am, Sir, yours, &c.

J. M. S.

Sir,—A mistake has been made in the numbering of the frames at the Architectural Exhibition, owing to which a subject exhibited by us has been attributed, in your concluding critique, to Mr. Moyr Smith. The frame alluded to is numbered 147; it should have been 146, which you will find, on reference to the catalogue, to be a design for a glass blind (executed in brown outline, on Powell's yellow glass, in lead work), by your obedient servants,

Goodman and Vinall.

24, King William-street, Strand, July 4, 1870.

Sir,—In the critique in your last issue upon "144, Art Tiles, and 145, sketches for glass under the name of G. E. Cook," it is added that the names of the artists should be given, so that full credit may be apportioned to whomsoever the various portions of the work may be due. I am therefore desirous of informing you that with the exception of one by Mr. Lonsdale, the tile cartoons were by Mr. Holiday; that they were carried out by myself, and that the cartoonist's name appears in the corner of each tile. I beg also to add that the designs and sketches for glass, No. 145, were by, Sir, your obedient servant,

G. E. Cook.

8, George-street, Hanover-square, July 4, 1870.

ARCHITECTS' CHARGES.

Sir,—My attention was drawn to the question asked in "Intercommunication," as to the practice some architects have of charging the contractor 2½ per cent. I thought of answering it by saying, that, unfortunately, some reputed respectable architects were in the habit of so doing, to the shame of the profession, but I feared that such an admission would not be inserted. Your leader of June 24, however, admits the fact, along with others—all true and all disgraceful, to those engaged in building operations; at the same time, you have a needed word of rebuke to the "hard bargainers" who manufacture rogues by their legal injustice. But there is one sentence to which I must object, and which calls for an explanation; it is this, "We would advise gentlemen who build to employ a *first-class* architect—an honest one at all events." Now what is a *first-class* architect? Most readers will understand by the term, as I do myself, a man who occupies a high, or at least a very respectable position as an architect. Such a man may often be as honest as his poorer companions, and may have gained his position by dint of ability, but does it not often happen that "first-class architects" have become so by pursuing the underhand courses you condemn, thus enriching themselves unjustly, while they have liberally expended much of these illegal gains, in bribing those who, as they believe, can procure them a "large job." Dishonesty does not always, nor indeed often, find its punishment in poverty; but there are other modes of retribution, even in this world. It is not every "first-class" architect who is even clever; we all know, that if a noodle finds work, he can employ a clever man to do it. I would therefore put in a plea for the occasional employment of the poor but honest members of the profession, the men who are poor because they scorn to adopt the usual modes of getting rich. There are many of them in all professions, but the rich public pass them by because they cannot spend as they spend, and the poorer public like the sound of a big name—I am, Sir, yours &c.,

F. S. A.

A SUGGESTION.

Sir,—Twice a day I ride past the "Hall of Science," &c., in the Kensington-road, and the gorgeous "memorial" opposite, and I am much edified by the intelligent criticisms passed upon each by my fellow-riders, the public. The idea most frequently suggested by the "Hall" is that of a monster twelfth cake, and the "memorial" is as constantly likened to the conventional "ornament" thereof. The critics proper are agreed that the structures in question are unhappy in their present relations; listen, then, to a plain remedy. Place the "memorial" on the "hall;" the former would occupy an improved site, and the latter would receive its appropriate *finish.*—I remain, Sir, yours, &c.

Y. De Wake.

MR. BAZALGETTE AND HIS SON.

Sir,—I see from the last report of the Metropolitan Board of Works, that Mr. Bazalgette the Engineer, shows that Mr. Levick, the district clerk of works, is in want of assistance; Mr. Levick has now two assistants. Mr. Bazalgette concludes his report (see page 666) with these words, "and I recommend that Mr. Edward Bazalgette [his son] be appointed as such third assistant."

A. Z.

Intercommunication.

QUESTIONS.

[1890.]—BEAMS, COLUMNS, GIRDERS.—Would some of your kind readers recommend me a small work—not too profound—for calculating the sizes of the above, and treating of the matter generally?—Young Architect.

[1891.]—DIMENSION BOOK.—I believe there is published a dimension book, or a book showing the contents of different size blocks of stone, &c. Can any of your readers inform me where I can get it, and about the price?—Randell Clifford.

[1892.]—BEST PERMANENT WASH ON OUTSIDE STUCCO.—Will any of your readers be kind enough to give a statement of the ingredients and quantities, which will answer for the above purpose; tried experiments, which have satissactorily answered?—J. P.

[1893.]—ARCHITECTS IN AMERICA.—Can any of your correspondents inform me if there is an opening for architects assistants and draughtsmen in America, and if so, in what part, and in what manner may such employment be heard of? Any information will oblige.—One Too Many Here.

[1894.]—LEAD ROOFING.—The rain appears to dissolve the lead on the ridgings of my house, causing whitish streaks to run irregularly over the slates. The slates are exposed to view, and look very ugly in the dry weather. Can any one suggest a remedy?—L. R.

REPLY.

[1885.]—BALL-ROOM.—The space to allow for each person should not be less than 16 feet superficial.—W. R. A., Uckfield.

STAINED GLASS.

Cork.—There is at present on view at the Edinburgh and Leith Stained Glass Works, Leith, a series of windows, just executed by Mr. Barnett for the church of St. Peter and St. Paul, Cork. The windows are four in number, each consisting of two lights, with tracery above, and, with a fifth window which has already been placed, will complete the apsidal chancel for which they are intended. Each light is designed in five stages. In the lowest is a panel containing the figure of an angel displaying a scroll; next comes the full length figure of a saint; then another panel, with an angel, over that a second full-length figure, and finally a third angel, occupying a panel in the cusp-headed top. The groundwork throughout is ruby glass, variegated with conventional foliage, the latter being supported from stalks which run up the sides of the lights, and, with their twisting and interlacing, define the various stages and panels.

Mark (Somersetshire).—In a sermon preached in the parish church of Mark on Sunday week, on the death of Mr. George Webber, deceased was spoken of by the preacher as "one who of late years had been occupied in an artistic work in this church which is likely to produce some effect on the prevalent and perhaps on our national taste." "The time may not be far off," said the preacher, "when the popular and general taste will become more formed, more correct, because more according to nature, and therefore more artistic; and our children may live to see the chromatic windows in this church studied as faithful revivals of the works of mediæval, or rather of protoæval art. The time may come when Biblical chromatics will be more heeded, and the ancient language of colours (coeval with creation, and still existing in the sun-rising East) read with understanding and spoken with fluency."

STATUES, MEMORIALS, &c.

The Albert Memorial, Hyde-park.—The model of the colossal statue of the Prince Consort, intended for the memorial in Hyde-park, is (says the *Morning Post*) about to be placed in position, and, if found satisfactory, will be reproduced in bronze and gilded. Mr. Foley, R.A., is the artist to whom this work has been entrusted, and her Majesty has expeessed her approbation of it, and her desire that it should be completed as soon as possible,

Smollett Testimonial Fountain.—Recently the foundation stone of a testimonial fountain at present in course of erection in the village of Alexandria, Vale of Leven, N.B., in honour of Mr. Alexander Smollett of Bonhill, was laid with Masonic honours. The plans sent in by Messrs. Adamson and M'Leod, Glasgow, were unanimously adopted by the Building Committee. The execution of the work was contracted for by Mr. W. Barlas, a local builder. The fountain is designed in the French-Gothic style of architecture, and is to be built with freestone from Bannockburn quarries, with shafts of red and grey granite. The cost is £500.

WATER SUPPLY AND SANITARY MATTERS.

The Thames and the Sewage.—The Commons Select Committee, to whom the Thames Navigation Bill was referred, have made the following general report to the House:—"The Committee having had before them an Act passed in 1855, "An Act for the better local management of the Metropolis, in which the Metropolitan Board of Works is directed to make such sewers and works as they may think necessary for preventing all or any of the sewage within the metropolis from flowing or passing into the river Thames in or near the metropolis;" and the Act passed in 1858 to amend the same; also an Act passed in 1865, 'For reclaiming from the sea certain lands on and near the eastern and south-eastern coast of Essex, &c., and for utilising the sewage of North London, &c., specially report that it appears, on the evidence of Sir John Thwaites and otherwise, that the Metropolitan Board have repeatedly had under consideration the best means of utilising the sewage of the metropolis, but that nothing effectual has yet been done, and the sewage still flows into the river Thames. The committee recommend that immediate attention should be given to the subject, in order that the sewage of the metropolis should be utilised as far as practicable; and, in the meantime, until this can be accomplished, the committee have deemed it expedient to approve the Bill which they have reported to the house for preventing any obstruction to the navigation of the river from the flow of sewage from the metropolitan outfalls.

Bridport Water Supply.—The prospectus has been issued of the Bridport Water Company, with a proposed capital of £12,000, £9000 in shares of £5 each, and £3000 in debentures. The engineers are Mr. J. H. Toline, C.E., of 1, Victoria-street, Westminster, and Mr. A. S. Hamand, of New-street, Birmingham. The source from which it is proposed to bring the water, is Litton Cheney, "where there is a quantity constantly running five times greater than Bridport, with its present population, could use, assuming an average consumption of thirty gallons per head per day." By an outlay of £9,500, it is stated that 250,000 gallons of water per diem are obtainable. The town council has, we see, intimated its intention of supporting the company, and very wisely so too, for an efficient water supply will go far to remove the unenviable notoriety which Bridport has for some time suffered under, of being extremely deficient of good sanitary arrangements'

Camborne.—The new reservoir for the Camborne Water Works, is being pushed on with all possible speed. Mr. West, of St. Blazey, is the contractor.

The Sanitary Condition of Wigan.—At a special meeting of the Wigan Public Health Committee recently, a letter was read from the medical department of the Privy Council, in which a very severe censure was conveyed with regard to the manner in which the sanitary regulations of the town are conducted. The letter went on to recommend that in future there should be a regular and frequently recurring inspection of the houses and domestic offices throughout the town, efficient and peremptory action against every nuisance that is discovered, the proper removal of excrementitious matter, and the appointment of a medical officer. After some discussion, the Board resolved to appoint a medical officer at a salary of £50 per annum.

The Sewage of Reading.—The town of Reading is at present applying to Parliament for powers to purchase land on which to distribute its sewage. The Bill has already passed the House of Commons, and is now before a committee of the House of Lords. An amusing incident occurred before the Committee last week, as one witness (Mr. W. Hope, of Barking), produced a number of specimens of field crops and fruits grown by sewage, being some of a total catalogue of 38 to which he alluded, and he apologised for introducing them into the Committee room, on the ground that Dr. Letheby had stated in evidence that, as a fact, nothing could be grown by sewage but Italian rye grass.

Water and Sewage Irrigation.—Mr. J. J. Mechi, of Tiptree Hall, writing on the subject of water and sewage irrigation, says he is glad to see that towns and cities are obtaining Acts of Parliament giving them powers to take land for such purposes. He reminds them that an essential element of success is the proper underdrainage of such soils as are not naturally filtrative. So far as the practical part goes there is really no difficulty, for steam power has made tha operation easy and cheap.

Bolton.—On Friday last the corporation of Bolton received from the Home Secretary the provisional order empowering them to acquire land for sewage outfall works at Bolton and other improvements, and a copy of it will be immediately served by the Town Clerk upon the respective owners.

LAND AND BUILDING SOCIETIES.

Haslingden Benefit Building Society.—This society has issued its second annual balance sheet. The number of shares purchased this and last year, amount in value to £2190. The society pays no dividend, but lends the money to members for their mutual benefit. It now numbers nearly 100 members, and the profits amount to 7½ per cent., whilst the working expenses of two years amount only to £34.

The Conservative Land Society.—The report of the executive committee, presented to the members at the 71st quarterly meeting on Tuesday, states that the receipts for the Midsummer quarter were £36,093 14s. 3d., and the grand totals to the same period £1,546,666 8s. 2d. The £50 shares issued for the quarter were 618, making the total number of shares issued to Midsummer, 1870, 34,278—a subscribed capital of £1,718,900—the withdrawals amounting to £389,029 1s. 7d. The reserved fund amounted to £10,500, exclusive of office premises, furniture account, &c. The report added that the society's members had invested largely in the shares of the United Land Company (Limited), estates purchased by which supplied the society with a large building advance business. As an illustration of the habits of saving by the members, the report referred to the reinvestment of their interest warrants, the amounts of which were added to their shares. The report was approved, and the usual vote of thanks passed to the board.

LEGAL.

An Architect's Action.—Court of Exchequer, Guildhall, July 6.—Before the Lord Chief Baron and a Special Jury.—Ebdy v. McGowan.—This was an action by Mr. T. C. Ebdy, architect, of Durham, against the Rev. E. McGowan, a clergyman residing near that City, to recover certain professional charges amounting to £241, relative to churches and a parsonage built, or proposed to be built for the defendant. The defendant had paid £25 on account, lodged the sum of £100 in court, and disputed his liability for the rest of the claim. Mr. Digby Seymour, Q.C., and Mr. Bruce appeared for the plaintiff; Mr. Aspinall, Q.C., and another gentleman whose name we did not hear, for the defendant. Mr. Seymour stated the case for the plaintiff, which was as follows:—His client had been instructed by the defendant to prepare designs, specifications, and obtain tenders for a church to cost about £2000, and had done so. However, when the tenders came in, the defendant, in accordance with the wish of the bishop, had determined on building two smaller churches instead, and of course this first church was abandoned. For this service he charged 3 per cent., being as per the scale of charges of the Institute of Architects, and this formed the first item of this bill. Plaintiff then prepared designs for a second church which had been built at a cost of £900, and for this he charged the usual commission of 5 per cent. He also prepared designs for two other churches not yet built for which, however, acting in a liberal spirit, he made no charge. The rest of the account, as regards the churches, was made up of travelling and other incidental expenses, such as stationery, postage, and advertising, which are always chargeable in addition to the commission. He also at the request of the defendant prepared designs and got tenders for a parsonage to cost about £2000, for which the defendant hoped to obtain a grant from the Ecclesiastical Commissioners, and the drawings and specification were sent to and duly approved by them with that view. In order to getting tenders for this, it was necessary to employ a surveyor of which the defendant was duly apprised. When the tenders for this came in, the defendant however refused to allow the plaintiff to proceed with the work, alleging certain neglect on the part of the plaintiff with respect to the church, and demanded the drawings and plaintiff's account. The plaintiff sent in his account accordingly, charging 3 per cent. and expenses, as before, also the surveyor's fees, but declined to surrender the drawings, as being contrary to the usage of the profession. The defendant then refused to pay his account, disputing the correctness of his charges relating to the churches, and denying his liability as to the parsonage altogether. He also refused a reference offered by the plaintiff, and had a copy of the account printed for circulation among the clergy of the diocese, evidently with a view to injure the plaintiff's reputation amongst them. Mr. T. C. Ebdy the plaintff, was examined at length by Mr. Bruce and cross examinedby Mr. Aspinall, and gave evidence in detail to the above effect. The first church had been designed so as to admit of partial execution, omitting the north aisle for the present, but the drawings, specifications, and tenders were got for the whole. After the advertisement for tenders was issued, the defendant wrote to countermand them. The defendant had written also telling him he would not be responsible for the parsonage, but the Commissioners should pay for it. This was however after the drawings were prepared. He (the plaintiff) had no correspondence whatever with the Commissioners, nor any claim whatever on them. The expenses he charged had all actually been incurred, and vouchers could be given. Mr. W. Fogerty, architect, was examined by Mr. Bruce as to the usage of the profession. The ordinary charge is 5 per cent. for the full service besides travelling and other incidental expenses such as stationery, postage, and advertising. Should the work be abandoned before tenders are received, the charge is 2½ per cent. if tenders are received, 3 per cent. The surveyor is usually paid by the builder who gets the work, but if the work be abandoned he is paid directly by the employer. In all cases the drawings remain the property of the architect. Cross-examined by Mr. Aspinall: In case of abandoned work the client had no right to the plans; they would be no use to him. In case of a client dismissing an architect in order to employ some other, unless it was done by consent, considered the plans should not be given up either. It was most unusual and irregular for a client to dismiss an architect until his whole work was done. The general rule was that the drawings are kept by the architect. Mr. J. P. Seddon, Hon. Secretary of the Institute of British Architects, examined by Mr. Bruce, gave similar evidence to that of the last witness. Would consider it most unjust for an architect to have to give up his plans to be carried out by some one else, possibly to the injury of his reputation. The usage of the profession is fully set forth by the published scale of the Institute. Mr. Aspinall stated the defendant's case: As to the first church, his client never wanted a north aisle to it at all, and before the tenders came in had countermanded them. He therefore should not be charged commission on the north aisle, nor for getting tenders, as by the printed rule the tenders should have been procured in order to entitle the architect to the half per cent. for them. The item for the second church, which had been built at a cost of £900, his client did not dispute; it was all that had been built from all the plans for which this enormous sum of £241 was charged. The travelling expenses, and advertising, stationery, &c., were excessive. It was absurd to charge such for a journey of 8 miles. As regards the patronage, his client, however, had distincly advised the plaintiff that he should look to the Commissioners, and not to the defendant, for payment, as he (the defendant) is only a tenant for life, and might soon have to remove to another parish. His offer to pay was on condition that the plans be given up to him, which the plaintiff would not do; and in fact the plaintiff coolly expected to be paid without giving anything in return. The Chief Baron: This seems to be entering on the question so recently agitated between the public and the architect of the Houses of Parliament. Mr. Aspinall: Not exactly, my lord; for there the work was finished, and the plans done with; but here the work was not even begun, and my client could do nothing without the plans. Mr. Bruce: It is really the same question, my lord; for if the client is not entitled to the plans when he pays 5 per cent., how can he expect them when he pays only 2½ or 3? The Chief Baron: I shall not enter on that question here, but give the defendant leave, in case of a verdict against him on this item, to move to have the verdict reduced or a nonsuit entered, as the case may be, should he be able to show cause before the full court. Mr. Aspinwall went on to complain that the case had been brought up to London, instead of being tried at the Durham assizes. Mr. Bruce said that his client had in vain offered to refer the case, but as the defendant would have it tried by a jury, it became necessary to bring it to London, in order to be able to get proper professional evidence. The Chief Baron said that had he known the nature of the case sooner, he would have ordered it to be referred. As it had gone so far now before the jury, it must be tried out. The Rev. E. McGowan was examined in support of the case stated by his counsel. Had never authorised the north aisle to the first church. Had distinctly told the plaintiff he was to be paid by the Ecclesiastical Commissioners for the patronage. Was told the surveyor would be paid by the builder. On cross-examination, admitted that in a long correspondence he had with the Commissioners, they had declined to deal directly with the architect, or to make any grant on account of his fees until the work was in progress. Had declined to proceed with the parsonage because the cost slightly exceeded the proposed grant, and also because he was dissatisfied with Mr. Ebdy. Had the plaintiff's bill printed for circulation among the clergy of the diocese. Mr. Sydney Smirke, R.A., architect, examined: It was the usual custom for the architect to retain the drawings, but in case of work being abandoned, thought the client had a right to them; also, if another architect were employed to superintend, as for works at a distance, as in the colonies, &c., thought the drawings should be given up also. The Chief Baron: Never mind about works in the colonies; tell us what is the custom in a case of this kind. Mr. Smirke: I think they ought to be given up, and in my own practice have done so. He never charged for stationery. Cross-examined: I know the rules, &c., of the Institute. I seldom attend their meetings. I have never subscribed any resolution to the contrary effect of the evidence given. Mr. Aspinwall addressed the jury for the defendant. It was clear his client had never authorised the north aisle, nor getting tenders for the first church. He was in no way responsible for the parsonage plans, which were to be paid for by the Commissioners. Mr. Bruce replied for the plaintiff. He was sure the jury would be indignant at the defence set up as regards the parsonage, as it was clear, from the correspondence between the defendant and the Commissioners, that he knew the latter would not be liable. The rest of the claim had been fully proved. The Chief Baron then charged the jury. As to the first item, he did not see what answer had been given to it. It was clear the north aisle had been shown on all the plans, and the defendant must have known of it. As to getting tenders, if they thought these had been countermanded in time, they would disallow the half per cent. for it, about £10; if not, they should allow it. He thought the travelling expenses also clearly proved. The item for postage and paper was controverted by Mr. Smirke; it was but a small item. As respects the parsonage, it was hardly to be believed Mr. Ebdy would have done all this work without knowing who was to pay him. The Commissioners could not be called on to do so, and the defendant must have known this. If the defendant had not dismissed the plaintiff, the work might have gone on, and he (the learned judge) hoped yet it would go on, as it appeared the plans had been quite satisfactory both to the defendant and the Commissioners. In the mean time they were called on to decide if the defendant were liable or not, and certainly nobody else was. The surveyor's item could hardly be questioned, as the defendant himself, by not employing a builder, had prevented those fees from being paid in the usual way. The plaintiff, by not charging for several of the plans, had shown no disposition to be grasping towards the defendant. The jury, after a brief deliberation, returned a verdict for the plaintiff for £106, being £10 less than the full amount of the claim, leave being given to the defendant by the judge to move the full court to reduce the amount, should it be of opinion, on the evidence, that plaintiff was not justified in retaining the plans of the parsonage.

Farrall v. Vincent.—An Architect's Claim.—The plaintiff in this case, which was heard at the Yeovil County Court a few days ago, was Mr. Charles Edward Farrall, late of Sherborne, architect and surveyor, and the defendant was Mr. John Vincent, an innkeeper, of Sherborne. The action was brought to recover £39 17s., being the balance of an account for plans and superintending buildings at Sherborne. The defendant pleaded that he was only indebted to the plaintiff in the sum of £11 10s., which was paid into court. The plaintiff was first requested by the defendant to prepare the plan of a cottage, for which he charged £1 1s., and subsequently did various other work for the defendant, the agreement being that he was to have 5 per cent. upon the outlay, which was to include his charge for drawings and superintendence. When he sent in his account, the plaintiff charged 2½ per cent. on the amount of the contracts, as that was the usual charge for preparing the drawings, and charged £1 per week for the time he had superintended the buildings—seven weeks. No objection was made to these charges at the time the account was sent in. The plaintiff had since done other work for the defendant, and received £30 on account. Some time after this complications arose between the parties, and the amount of the balance owing to plaintiff was disputed.—Mr. G. R. Crickmay, architect and surveyor, of Weymouth, deposed that the plaintiff's charges were perfectly fair and reasonable—in fact, they were less than the usual charges.—Mr. C. E. Benson, architect and surveyor, of Yeovil, gave evidence to the same effect, and said that the plaintiff was perfectly justified in charging for personal superintendence, as the nature of the work (an erection on old foundations) demanded his presence all day.—Mr. Thomas Farrall, architect and surveyor, of Sherborne, and brother to the plaintiff, and Mr. George Croad (the builder of the work in dispute), were also called for the plaintiff.—For the defence, Mr. Joseph K. Chant, builder and surveyor, of Yeovil, said he considered the plaintiff's charges rather high, and stated that it was an extraordinary thing for an architect to charge for time and to act as clerk of the works.—Plaintiff produced a letter in which defendant admitted several items of the disputed account, and promised payment.—His Honour allowed £5 as a sufficient sum for superintending the work, and deducted 15s. from the charges for preparing plans. Judgment for £37 2s. and costs.

Cargo of Lathwood.—In the case of Kreuger v. Blanch, the defendant, a merchant at Gloucester, gave the plaintiffs an order for "a small cargo of lathwood, of about sixty fathoms. The plaintiffs accepted this order, but not being able to obtain a suitable vessel, they forwarded eighty-three fathoms on board the Scandia to the port of Gloucester, and severed sixty fathoms from the rest of the cargo, and tendered them with a separate bill of lading to the defendant. In this action for non-acceptance of timber so tendered, it was held by the Court of Exchequer that the contract was for an entire cargo of sixty fathoms, and not for sixty fathoms parcel of a cargo, and that the defendant was not, therefore, bound to accept the timber.

S. Mary's Church, Taunton.—On Tuesday week, application was made in the Consistorial Court of Wells, before Dr. Wallis, for permission to erect iron gates, with brass ornaments, at the chancel screen of S. Mary's Church. Similar gates were erected recently, but removed on the order of the court, as they were not contained in the faculty. The application was made by Mr. Forster, proctor, on behalf of the churchwardens, Messrs. P. Taylor, S. Farrant, and J. Small, and was opposed by Mr. B. Pinchard, on the ground that gates separated the nave from the chancel, and supported the idea of greater sanctity in the latter.—Judgment reserved.

Our Office Table.

Application of Mica as a Substitute for Bronze.—A means has been found of greatly increasing the value of mica, by converting it into a colouring material. The mica is reduced to small pieces in a stamping mill, digested with chlorhydric acid, cleansed by washing, and sorted by sieves into sizes. The mica scales so prepared have a beautiful vitreous lustre, a silvery appearance, and bear in commerce the name of brocade crystal colours, or mica bronzes. The advantages of these brocades over the common metallic ones are:—1. They contain no unwholesome substance. 2. They possess a metallic lustre like the metallic brocades, and much surpass them in splendour. 3. Brown, blue, black, green, and red colours of rare brilliancy can be obtained, which is not the case with the metallic brocades. 4. They are not dimmed by sulphur vapours. The analyses by Drs. Cech and Schneider show that the colouring matter of the rose-brocade is cochineal; that of carmine is fuchsine; bright red, fuchsine and Havanna brown; violet, Hoffmann's violet; bright blue, Berlin blue; dark blue, probably impure aniline blue or Girard's violet; light and dark green, a mixture of aniline blue and curcuma; gold, curcuma; silver, the mica alone, &c.—*Journ. fur Prakt. Chemie.*

Dwellings for the Industrious Classes.—The twenty-sixth report of the directors of the Metropolitan Association for Improving the Dwellings of the Industrious Classes, presented to the shareholders at the annual meeting last week, after giving details of the receipts and expenditure in connection with each block of buildings belonging to the company, the mortality in each, and other particulars, went on to say that the bad debts this year, out of an average of 770 tenants, amount to £20 1s. 5d. only, or not one halfpenny in the pound upon the gross rents received—viz., £11,510 10s. The deaths upon the entire property of the association have this year been 60 out of an average population of 3827, of which 39 were of children under ten years of age. It appears, therefore, that the average rate of mortality in the buildings of the association has been under 16 per 1000, whilst that of the metropolis generally has exceeded 24 per 1000. In the revenue account there appeared a payment of £462 8s. 3d. on account of the Soho chambers. Of this sum £369 7s. was paid for dilapidations, and the remainder is the balance of rent, rates, &c., to the termination of the lease. Notwithstanding this heavy charge, and the fact that the capital invested in the course of the year in the completion of the Alexandra-cottages and the conversion of Howard-buildings has yielded returns during only a part of the year, still there is a surplus, after paying all current expenses, of £5227 15s.. The directors recommend that a dividend of 4½ per cent. be paid to the shareholders, free of income-tax, and that the balance of £442 17s. 8d. be carried to the guarantee fund.

Society of Engineers.—Arrangements have been made for a visit of the members of the Society to the brewery of Messrs. Truman, Hanbury, Buxton and Co., and to the Great Eastern Railway works, on Monday, the 11th of July, 1870. Members and Associates to meet at Truman's Brewery, 174, Brick-lane, Spitalfields, at 12 o'clock, noon, on that day. Visit to the Great Eastern Railway Locomotive Department, at Stratford, at 3 o'clock, p.m.

New Streets in Connection with the Holborn Viaduct.—On Monday afternoon a new street in connection with the Holborn Viaduct was opened for traffic. It runs from S. Sepulchre's Church on the Viaduct, and over the London, Chatham, and Dover Railway, into the Farringdon-road. The entire length of this street is about 600ft. with a carriage-way of 30ft., and two footways of 10ft. each; and as the gradient is but 1 in 45, its public advantage will be at once apparent. Another new street is in course of formation from the Holborn-circus to Fleet-street, and the footway on that part of the eastern part of it leading from Holborn-circus to Shoe-lane was also opened to the public. The width of this street and of the pavements will be the same as in the case of the other street above referred to.

Proposed Assistant Surveyorship of Public Works.—Referring to the contemplated appointment of an Assistant Surveyor of Public Works, an evening contemporary ventures to hope that if this new office is to be created it will be of a practical nature. A surveyor who should make it his business to walk about and inspect works in progress, whether under the direction of Government or private capitalists, without waiting to have things brought officially under his notice, would form a most useful addition to the public service. Had an officer charged with a mission of this character strolled down the Thames Embankment, and brought his æsthetic faculties to bear upon the marvellous station erected by the Metropolitan District Railway Company at the entrance to the new Blackfriars Bridge, there would at least have been a commotion and a remonstrance, and the locality might not have been disfigured as it now is. What we want (says our contemporary) is an official thoroughly well versed in the principles of engineering and architecture, who might represent the public interests independently, and, if he did nothing else, bring public opinion to bear upon matters which require to be considered before they are past remedy. The practical functions of a censor of art and utility might be very conveniently performed by an officer so empowered, and responsible directly to the First Commissioner of Works, with the guarantee for publicity which would be secured by the presentation of his reports at short intervals in a shape open to the public.

London Graveyards. — The *Commercial World* says:—"Before the London graveyards were permanently closed by Act of Parliament, their condition, choked and infected with human remains, had become an ever-present danger. That special form of a crying evil has disappeared, but in its essence and germ it is still in our midst. The objections which thirty years ago were urged against the London graveyards as to their position and state are fast becoming equally applicable to all the more central cemeteries. Palpably several of them long ago become entirely divested of their suburban character. Bearing in mind the vast increase of the population, and consequent increase of mortality, and the position of those cemeteries, we may be said to 'bury our dead in the midst of the living' in a scarcely less degree now than before the visitation of cholera and the persistent teachings of Drs. Sutherland and Southwood Smith, and their fellow labourers in the cause of sanitary reform, had taught us the utility of better ideas. From reports which reach us it would appear we are fast forgetting those scientific lessons. Instead of persistently and peremptorily refusing to use our mural cemeteries, in some instances we have to the utmost enlarged their borders, and, therefore, to future generations, increased their capacity of mischief. Besides, we are probably only preparing additional work for future excavators and railway engineers."

The Water Supply of Jerusalem.—A letter from Jerusalem says:—"The Abbé Richard, so well known for his cleverness in discovering water-springs, has just made a lengthened stay here, and on the invitation of the governor, Kiamil Pacha, has made some hydro-geological surveys in the town and environs. The result is most satisfactory. According to the learned abbé there are two means of supplying the Holy City with good drinking water in sufficient quantity—1. By wells to be bored in the rocks, in the town and close by outside. 2. By aqueducts bringing the desired liquid, first to the sealed well (the *fons signatus* of the Canticle of Canticles), then to the reservoir of Arroub, and finally to Jerusalem. By either of these methods the scarcity of water felt every year would be definitively overcome. The Abbé Richard was in favour of the second plan, in consequence of the better quality of the water and the larger quantity to be thus obtained."

INSTITUTION OF SURVEYORS.—The annual dinner of this Institution was held on Monday evening in the large hall of Willis's Rooms, and was attended by a numerous party of members and associates, Mr. Richard Hall, the president for the current year, occupying the chair. After the usual loyal and patriotic toasts (that of "The Army and Navy" being responded to by Lieut. Col. G. A. Leach, R.E.) had been given, the chairman presented to the Hon. Sec., Mr. J. W. Penfold, the service of plate which had been subscribed for by the members and associates, in recognition of his services in connection with the foundation of the Institution, and during the subsequent two years. Mr. J. H. Lloyd proposed, in eloquent terms, the toast of "Prosperity to the Institution," and after his health, and that of the Chairman, and of the Past President, Mr. John Clutton, had been duly honoured, the proceedings terminated. It was mentioned, incidentally, that the Institution numbers 240 members and associates, including a large proportion of the leading surveyors.

THE BRADFORD TOWN HALL.—A special meeting of the Bradford Corporation was held on Wednesday, for the purpose of varying a resolution by which the expenditure upon the new structure was restricted to £40,000. The original tender of Messrs. J. Ives and Son, of Shipley, was £39,535, but certain additions are suggested, which the committee recommended for adoption, increasing the amount to £43,730; and it was, therefore, necessary, before the contracts were signed, that the subject should again be brought before the council. The original resolution was varied in accordance with the recommendation of the Finance and General Purposes Committee, and the new hall will, therefore, shortly be commenced.

Chips.

The Independents of Yarmouth have just completed a new chapel in Middlegate-street. It is in the Gothic style, and has cost upwards of £3000.

The statute of the late Mr. Peabody, near the Royal Exchange, has been again uncovered. It is now fixed on its permanent pedestal, and is surrounded with iron railings with gilt tops.

The total cost, up to the present time, of the Thames Embankment has been £1,650,000.

The Oxford Architectural and Historical Society recently visited Warwick Castle. The general opinion of the members, after a thorough inspection, is that none of the existing buildings are earlier than the reign of Edward III.

Saturday week was a day of great rejoicing at Maidenhead for Churchmen, as on that day was finished the tower and building of S. Luke's Church, after designs by Mr. G. R. Clarke, to accommodate 900 people.

During the taking down of the house No. 48, London Wall, recently, a section of the old city wall, built upon piles, was found. The piles were quite sound when taken up, and were about 7ft. long.

The sale (by tender) of the materials and fittings of the Church of Allhallows, Staining, Mark-lane, took place on Wednesday last. The tower is to be left standing,

The construction of the new promenade pier at Westward Ho, has been commenced. Mr. Inman, C.E., is the resident engineer.

A new market at Spennymoor was opened on Wednesday last. A town hall at the same place is in course of construction.

The total sum paid and promised to the Bishop of London's Fund is now £402,000. Five churches have been consecrated since the beginning of the year, while two others are in course of erection. The Haberdashers' Company is prepared to give £3000 towards building a church at S. Peter's Hoxton.

New schools at Croscombe, near Wells, built through the munificence of the late Mr. Townsend, surveyor, of Bristol, were opened on Wednesday week by the Bishop of Bath and Wells.

The guardians of the Bolton Union have been discussing the desirability, or otherwise, of making 400,000 bricks, upon land belonging to them, adjoining the workhouse, but no decision was arrived at.

S. Mark's Church, Fletcher-street, Bolton, has been temporarily opened, but it is far from finished internally, owing to want of funds.

It is proposed to add extensive additional infirmary accommodation at the Bolton Workhouse.

The new covered market at Preston is progressing satisfactorily, and will, it is expected, be completed at the end of the present month.

S, James's Church, Preston, is about to be rebuilt,

A new school-chapel is about to be erected for S. Paul's district, Preston, at a cost of £1,150.

The accommodation at Marlborough House being very deficient for the Prince and Princess's household, another story is to be added to the building,

Timber Trade Review.

The sale by auction yesterday at the Baltic Sale Room, Threadneadle-street, consisted of—

29,390	Quebec yellow pine, deals, and battens.
3000	Taguenay white spruce ditto.
4600	Foreign yellow and white ditto.
500	Loads Dantzic fir timber.
220	Loads S. John's, &c., birch.
16,600	Miramichi, &c., white spruce deals, &c.
19,300	Christiana, &c., yellow ditto.
24,200	Swedish ditto.
6000	Petersburg and Riga white ditto.
6500	Norway white ditto.
2100	Swedish white ditto.
600	Dantzic deck deals.
30,700	Norway flooring boards.

THE Aroa Timber Company have issued a prospectus. They appear to have obtained a 31 years' concession of valuable forests in Venezuala, chiefly consisting of mahogany, cedar, fustic, and lignum vitæ. By their calculations the cost price here per ton would be £4 13s. 6d. If they can command steady sales this would leave a handsome profit to the shareholders. Messrs. Churchill and Sim are said to have reported favourably on the wood already sent over.

WAGES MOVEMENT.

BRISTOL ARBITRATION BOARD.—A general meeting of operative carpenters and joiners of Bristol was held on Tuesday night for the purpose of electing operative members of the arbitration board in the place of those who have been selected by ballot to retire. The retiring members were Messrs. W. B. Harris, Tucker, Shorney, and Salter, of whom Messrs. Harris, Shorney, and Salter were re-elected, Mr. C. Jeffreys being added to fill Mr. Tucker's place. Mr. Lewis, a member of the board, having resigned, Mr. H. Heath was appointed in his stead. A letter from Mr. Lewis Fry, the umpire, similar to that read at the meeting of master builders on the previous evening, was read, in which he expressed his opinion that it was undesirable that he should attend a meeting of employers or operatives separately. Mr. Westaway, in the course of the business, complained of the indifference of many of the operatives in regard to the arbitration board, and expressed his surprise at seeing only a few present, although the meeting was public and open to non-society as well as to society men. At the conclusion of the business a vote of thanks was passed to Mr. Lewis Fry for his impartiality and courtesy in his position as umpire.

THE BRADFORD CARPENTERS AND JOINERS.—On Monday, agreeably to a resolution come to recently, the operative joiners who do not receive the advance of a halfpenny an hour recommended by the Board of Arbitration struck work and left the employment of the defaulting employers. About 127 men turned out, and 400 remain at work where the advance has been conceded The men express a sanguine hope that their request will be acceded to in a few days.

TENDERS.

CRICKLEWOOD.—For work at Hill-side, Cricklewood, in finishing 5 houses for J. Westwood, Esq., Manor House, Dulwich. Frank E. Thicke, Esq., 37, Norfolk-street, architect:—

THE BUILDING NEWS.

LONDON, FRIDAY, JULY 15, 1870.

MANCHESTER ABBATOIRS COMPETITION.

THIRTY-FOUR architects have been found willing to compete for the trouble and bother of having to build some new slaughter-houses for the city of Manchester. Certainly the ages of faith are not past, and the credulity of mankind is still rampant, especially in architects. How thirty-four men could be found with such a large belief in themselves and the Corporation of Manchester is a mystery. That five or six architects in Manchester should compete for it is reasonable, but that any architect out of it should do so is inexplicable. Surely the record of competitions in general is enough to deter wise men who have no local influence from joining in them, and the northern competitions particularly record that none but a local deserves the prize. Recal to mind the Manchester Exchange competition, think of the Manchester Town-hall competition, remember Bradford, and then, ye hopeful ones, pause. We hardly need say that all the three prizes have fallen to Manchester men. No person capable of drawing a logical deduction can feel the slightest surprise at it, for when was it otherwise in Manchester? What we really do feel surprised at is that in some degree the decision is just, for, strange to say, the two best designs submitted are those to which the first and second prizes are awarded. There is no doubt that Mr. Darbyshire's and Mr. Salomans plans are by far the best-considered and the best adapted for their purpose of any sent in, and that their merits are so equal that it is not possible from the cursory examina- we have been able to give to the plans to say whether Mr. Darbyshire's or Mr. Salomans' is the better, and we therefore accept as just the committee's decision, so far as these two plans are concerned. Not that we think it would have made the slightest difference in the result had these two plans been the worst instead of the best, but by the doctrine of chances, the present system of competition must bring the best to the top sometimes, and this is one of those times. In Mr. Darbyshire's design there is not the slightest suspicion of architecture as an art. It is simply an assemblage of sheds for the slaughter of beasts and the sale of their carcases, and from a ratepayer's point of view this is undoubtedly a merit. The arrangement of the plan is simple. The carcase market forms the front of the building, and behind this comes two blocks of slaughter-houses, the one for wholesale, and the other for retail butchers; behind this again is the tripery and other abominations, and the slaughter-house for pigs. This latter we think very inadequate in size, being only about 24ft. by 36ft., and considering that Manchester is a very fatal place to pigs, and that their death rate rises to something like 1500 per week, there is not anything like space enough provided for them. There are a good many other faults in the arrangement of Mr. Darbyshire's design which will need correction before it is fit for execution, and its chiefest merit at present is the very careful study of its working accessories. Not that he is singular in this, for Mr. Salomans' design is almost equally well thought out—indeed, in some points better, and there is very much that is good in this design and of which we have no doubt the corporation will thankfully avail themselves. As architecture, the design is immeasurably beyond Mr. Darbyshire's; in fact, it is too good, and, by a singular want of the recognition of the fitness of things, Mr. Salomans not only covers his carcase market with the same kind of roof as he designed for the Art Treasures Collection, but calls attention to this fact in his report! He has imperial authority, however, on his side, for did not Napoleon (the Great, we mean) say that a market was "the Louvre of the people?" But yet between carcases and art treasures we detect a difference which we think even Mr. Salomans might have recognised. The arrangement is very similar in plan to that of Mr. Darbyshire, excepting that he has two entrances into the abbatoir yards, and Mr. Darbyshire has only one. Mr. Salomans is, however, much more considerate for the "unclean beast," and provides three times as much space for pig-killing as does his more fortunate competitor. His drawings are as carefully "got up" as they can be; Mr. Darbyshire was apparently so sure of winning that he didn't care to take any trouble about his. On one point there is a great difference between these two. Mr. Darbyshire says his designs will cost £16,000, and Mr. Salomans says his will cost £27,000. Now we are not in the slightest degree surprised at this variation. Nothing in the way of an architect's estimate does surprise us; we simply look upon it as a figure of speech, and not a figure of fact. But if Mr. Darbyshire can carry out his design for anything within a very vague approach to that sum, he will avenge the wrongs architects have received at the hands of builders in a manner very appropriate to the erection of slaughter-houses. Why Messrs. Pennington and Bridgen are rewarded with the third premium is not by any means clear. It is true they are Manchester architects, and it is equally true that they must have very powerful interest in the council; certainly there is but this to account for it, for there are many other designs much better than theirs, and some of them by Manchester architects too; so why they are the favoured recipients of the third prize is as yet unknown to us, but not unsuspected. On their plan there is very much waste space, and not only do their slaughter-houses abut directly on to the carcase market, but they absolutely draw attention to this wretched arrangement in their report, and are crass enough to consider it a merit. What little claim to architecture the design may have may be described as due to an Italian burlesque character, and the influences of Messrs. Pennington and Bridgen's friends must be great indeed when they can persuade the council that there is any merit whatever in such plans as these. Very much better is Mr. Lowe's design, and if he only had some of that influence he possessed in the Exchange competition, he might have been placed third here also, and that much more deservedly. He sends two designs; the first of them, in our opinion, vastly superior to the premiated plan placed third. Its architectural merits are far higher, and the arrangement far more convenient and more suitable to the sanitary well-being of the unsavoury place. Its architectural character is of a far higher standard than that of the premiated design, and, like it, is based on Italian traditions. There is much merit in Mr. Stephens' design, but he has been so anxious to study well mechanical dodges in detail arrangements that he has almost forgotten some of the leading requirements necessary to be observed in a building of this character. This, indeed, is a general failing, we are shown in many instances improved hooks for hanging up the carcase, whilst in the same design there is no possible means of removing the offal without taking it through the general market, and another design on strictly Gothic principles shows no means of getting the beasts into the slaughter-houses except by driving them through the carcase market. The proverbial bull in a china shop would have to resign in favour of one in a dead meat market had the designer of this plan been sufficiently well known to the corporation to ensure his design being selected. Of the general range of the other drawings we need hardly speak. Not a name of any value is attached to them; they are chiefly the work of very young men, and the work is very young indeed. The wiser, the older, and the more experienced men have evidently fought shy of a Manchester competition, and the consequence is that it is simply a large battle amongst little people. Even many of the best men in Manchester have had nothing to do with it, and the *naiveté* with which the only knighted Town Clerk in the kingdom announced that it was a singular coincidence that the three prizes had fallen to three Manchester architects, and that the successful competitor was favourably known to the Corporation from having worked for them before, was one of the most delicious bits of broad comedy we have of late encountered in official life. It would really save a great deal of trouble if corporate bodies would fight out the selection of an architect before hand. The ulterior result would be precisely the same, and the unfortunate innocents need not be massacred in public, nor should we ourselves be compelled to attend the execution. Of course there would be a good deal of heartburning, and much envy, hatred, and malice, but those thirty-one unfortunates would have been saved much trouble, much expense, and the bitter knowledge that without influence nothing else avails. One piece of advice we give them—Don't do it again, and if you are ever tempted to compete for anything far north turn over the columns of our past numbers and reflect on the lessons you may learn there.

◆

SCULPTURE AT THE ROYAL ACADEMY.

IT has become quite a habit with art critics to write about British Sculpture in a mournful, desponding strain, to allude to it more as a painful necessity than as an actual and living branch of our fine arts, and to deplore the loss of the good old days of sculpture, when, whether in the service of religion or for the mere love of the beautiful, it achieved its noblest works and attained its highest success. We do not wish to join the ranks of these grumblers, or to class ourselves with those who contend that sculpture is as dead to us as an art as Greek and Latin are to us as languages. But with the best intentions to weigh well the altered circumstances and conditions under which our sculptors labour, and the very different field open to them for their works, it is impossible on entering the hall surrounded by the grim file of ugly old gentlemen at the Royal Academy, not to feel that there is much that is wrong and false in the modern practice of this art.

It is hardly the place in a notice of an exhibition to lay down our views of what sculpture should be, and it would be much easier to show what it ought not to be at the expense of the works contributed; but in order to justify our observations, we may state briefly that we regard the position of true sculpture to be to the remaining five arts what poetry is to literature. We do not wish here to imply that both painting and music may not have in their noblest developments much of this character, but they have other aims and objects in which they may attain to excellence, whereas sculpture can really only be noble and great in an ideal field, and sinks into the mean commonplace whenever it attempts a realistic treatment, or is used for the purpose of mere portraiture or pictorial representation.

It is, however, on portraiture that our sculpture depends for its support, if not for its very existence, and as such it must be judged, leaving out all preconceived notions of idealism and the beautiful. We must confess that even in this field we have dreams of what might be done, and there is no reason why a portrait should not in many respects be enjoyable as a work of art, but it is here that so many of the busts fail. They give us no pleasure, they may interest us on account of the celebrity of the model, or they may be valuable to us as reminiscences of our friends, but in an art point of view they are worthless, and as art may not be judged. Why do so many select the latter portion of their lives as the time for immortality in marble? Men and women should be preserved to us only as they appeared to us in their prime—such as they were at the best and loveliest period of their existence, before they had become wrinkled with age and furrowed with care. The Queen is known to thousands of her subjects, and should be known and go down to posterity only as the fair young creature of our coins and postage stamps, and the portraits of mature years are, in this sense, for the most part, sculpture misapplied. But the sculptor, as an artist, can scarcely hope to change the course of popular sentiment, or to direct public opinion, and he must mould his clay or carve his marble in accordance with the taste and wishes of his patron, however much he may desire to educate his countrymen, and raise the standard of his art.

The portrait sculpture at the Academy this year presents us with few striking features, and except in those respects we have mentioned, has little we can find fault with or admire. The statuette of the Queen at the Spinning Wheel, 1125, savours rather of a well-known nursery rhyme upon which we can remember that our notions of royal avocations were founded. We rather pity Her Majesty in this central position, surrounded by the eight very dusty celebrities in their niches. But, to take the works in their catalogue order, we pass on to the Sculpture Gallery. No. 1042, bust of a lady, by J. Lawlor is an instance of a pleasant and successful portrait; so also are many of the children's heads, in which we have the freshness and grace of early life preventing the sculptor from invading the realms of caricature by an attempt to portray the facial deformities of advanced age. Notably pleasant in this way is Lilian, 1045, by T. A. Bickerton, and No. 1200, a Boy's Head, by J. Durham, A. As an instance of another extreme, we may point out the caricature No. 1054, by W. Davis. Mr. J. E. Boehm has an excellent bust of an old man, *etat* 79, No. 1102, but No. 1098, a bust in bronze, by Mr. G. Simonds, is more striking on account of its method of treatment than for any other reason. The title should surely have been "H. L. Pattinson, Esq. (in the character of Hercules)."

This gives us an opportunity of noticing the various methods of dealing with the shoulders, which appears to be, upon the whole, rather a bugbear to bust sculptors. In most cases the device of the hairdressor is adopted, and the head and neck of the model rises from a confused mass of folded drapery; in others, the artist makes a bold dash at nature and gives us a most carefully rendered cravat and shirt collar. Perhaps this is done in the case of individuals whose only noticeable peculiarities consist in their arrangement of these articles of dress. In others, again, we have the chest in all its natural beauty, but indefinitely prolonged downwards and outwards to superhuman dimensions to afford a base for the work of art to rest upon, instead of the meaningless little turned pedestal commonly employed for this purpose. This latter flesh treatment, as we may call it, is resorted to by Mr. E. Davis, in his bust of Dr. Quain, No. 1187, and we find it also in Mr. Wyon's work, No. 1188. No. 1202, by Mr. J. A. Acton, is a good likeness of Mr. Bright, and a good example of the use of the ordinary clothing in sculpture; while the larger proportion of the busts in the gallery show us the plan of introducing drapery, or, in the case of ladies, a decorous fringe of lace, as in No. 1150, by Miss C. M. Adams, and in the graceful bust of Mr. Birks, No. 1154, by Mr. J. Durham, A., in both of which cases, however, the lace is perhaps a trifle over-elaborated. No. 1185, Dr. Muspratt in marble, resting on the volumes of his work on Chemistry, is an affectation which savours rather of the commercial spirit. There are many reasons why medallion portraits are better than busts, and we regret that this art is so little practised; notice, however, a clever little head of Mr. A. S. Coke, by F. S. Potter, No. 1146.

We must conclude with a few observations upon the sculpture proper, which, as we have stated, we must judge upon a different footing to the portraiture. No. 1180, Blackberry Picking, is a pleasant figure of a girl by E. B. Stephens, A. No. 1184, a mezzo-relievo, by F. J. Williamson, from a subject in "Adam Bede," is an extremely well-grouped and agreeable work. No. 1195, Ariel, by F. M. Miller. This gentleman's work must be well known to the frequenters of our exhibitions. There is a great sameness about it, but it is not devoid of grace of outline and expression. Mr. T. Woolner's group of children in bas-relief, entitled "In Memoriam," is the best work of the kind we have seen for some time. It represents three girls and a boy, and is most probably intended for a church tablet. The entrance to the great room is guarded on either side by winged figures, memorial in character, No. 1167, by S. Ruddock, and a group of three figures entitled Memento Mori, by Count Gleichen, No. 1171. Extended wings are extremely difficult to manage in sculpture, and generally give exactly the opposite impression of what they are intended to give—looking heavy instead of light; this may be seen especially in the latter example. Scattered through the rooms are some very excellent groups representing Hercules strangling Antæus, sent up by students of the Academy in competition for the Gold Medal; especially clever is the group by H. Montford, No. 1093. Mr. Bell's bust of the figure of the United States, part of his group for the Albert Memorial, No. 1103, a colossal female head, wearing an eagle's feather, is very fine, as is the entire figure, which we had the pleasure of seeing in his studio. There is the usual table in the sculpture gallery filled with the usual *sculpturesque* toys in bronze and terra-cotta, favourite terriers and pet poodles, quite as much beneath notice as sculpture as the black and white marble dog at South Kensington, but serving to interest the public and to cause them to linger a few moments longer in a room which has otherwise but few attractions for them.

THE ASSISTANT-SURVEYOR OF WORKS.

IT was announced some short time ago that it was the intention of Her Majesty's Office of Works and Buildings to appoint an assistant-surveyor in that department, in consequence of the additional work that has been lately thrown upon the office by the changes that have been made by Government in the manner of carrying out public works. Application was at first made to the Institute of Architects to recommend a suitable person for the proposed appointment, but that body declined to do so, and it was then resolved to advertise, and to select from the candidates by public competition. The duties of the post, as explained by a circular letter from the Office of Works, are the designing and superintendence of new buildings, as well as the superintendence and responsibility for the repairs and maintenance of buildings. The candidates are required to have a knowledge of the strength of building materials, their nature, and the principles and methods of applying them to building purposes; the prices of materials, and the value of labour upon them. They should understand architectural drawing, and how to make working plans and specifications, to take out quantities, and estimate work to be done, the measurement of work executed, and abstracting and bringing it into bill. In addition to these requirements, the candidates are expected to be able to make technical reports properly composed and spelt. The Civil Service Commissioners were requested to conduct the examination of the candidates, which took place on the Tuesday, Thursday, and Friday of last week, at the office of the Commission, Cannon-row. The examination was entirely by written papers, and comprised English composition and dictation, the history of building materials, measuring and valuation, and designing and specifications. Some thirty candidates presented themselves on the first day, but these were afterwards, from various causes, reduced to twenty-one, and it is from among these the final selection will be made, it being understood that the principle adopted will be one of pure competition.

It is a matter of considerable regret that the Institute, from some feeling of pique at the treatment of one of their members by the Chief Commissioner of Works, should have refused to assist Mr. Ayrton in selecting some qualified person or persons for the appointment. Such a manifestation of animosity is below the dignity of a body that aspires to represent the architectural profession, and the satisfaction of snubbing a Government official is ill compensated by the injury that may be inflicted upon the public service, as well as upon the profession generally, should an inefficient person be chosen through the refusal of the Institute to assist the Government in making a proper selection.

It is possible that the Institute may have felt a disinclination to recommend any one individual for the office, from fear of an imputation of favouritism, but there could be no reason against its recommending the names of some half-a-dozen men, and leaving the decision in the hands of the Office of Works. This course would have prevented any suggestion of unfair preference by the Institute, and at the same time secured the services of a competent man for the post. Even if the Institute declined nominating to the appointment, it should in its own interest have undertaken the examination of the candidates. The Civil Service Commission is, from the nature of its work, a very unfit body for the purpose of examining on technical subjects, while the Institute, on the other hand, is remarkably well fitted for that purpose, and has a complete machinery already organised in the Board of Examiners for District Surveyorships, which might have been easily adapted to the circumstances of the case. There can be no room for doubt that the Government would have gladly availed itself of the services of the Institute in the matter of the examination, and it is much to be regretted that such services were not offered. The Government might have been thereby spared considerable expense and embarrassment, the dignity and interests of the profession might have been vindicated, while the Institute might have obtained a better position with regard to the Government, which might be of service in the adjustment of existing difficulties between the two bodies. An opportunity has been recklessly thrown away by the attitude assumed by the Council, and it is to be hoped that this matter will engage the attention of the members at the commencement of the session. Had Sir William Tite been president, this result would probably not have occurred.

We have no wish to disparage the conduct of the Office of Works, or of the Civil Service Commission with regard to this appointment. They have evidently acted up to their lights, and are desirous of doing what is right and honourable, but it is evident that if they had had the advice of some practical professional man they would have avoided some errors into which they have fallen. For example, the accomplishments required of the candidates are of the most utopian kind, and could not by any possibility be found united in one individual. It would be requisite for a man to be at once an architect, a draughtsman, a measuring clerk, and a quantity surveyor. Any-one who has had any experience knows how difficult it is to get an assisiant who is fully qualified in any one branch of the profession, and to attempt to combine so many branches in one person is absurd. The Institute discourages architects measuring and taking out quantities, and refuses to admit architects as Fellows who undertake this description of work, and, as a consequence, this kind of business is now almost exclusively confined to a particular class of surveyors.

The duties of designing and superintending buildings, and of taking out quantities, are, moreover, incompatible. The task of designing and superintending buildings affords scope for the exercise of the very highest genius, while quantity-taking and measuring are at the best merely mechanical processes, for which nothing more than ordinary care and practice are needful, and to set an accomplished artist to take out quantities or measure up work would be the act of a man who would "eat mutton cold, and cut blocks with a razor." We will say nothing about the curious postscript which follows the enumeration of the various duties required of the candidates, that they should be able to prepare technical reports, properly composed and spelt, as this has been already alluded to by Mr. Beresford Hope in the House of Commons, when putting a question to Mr. Ayrton. We see nothing in this than an official cautiousness arising from ignorance that an architect who has been able to master all the difficulties of his profession must of necessity have received such an education as to read and write correctly, if not with fluency.

The main defect of the examination by the Civil Service Commission is the absence of any oral test. The whole of the examination is written, and although this system may work very well for the generality of Civil Service appointments, it is obvious that in this case a *viva voce* examination should have been added. It is most important in the case of a surveyor that he should not only be a man of ability and solid attainments, but also a man of ready resource and invention. The appearance and personal habits of the man should also form an element in the choice of the examiners, and it is of course impossible to form any opinion upon these points from a written series of answers to questions.

◆

ARCHITECTURAL PUBLICATION SOCIETY.

THE annual general meeting of this society was held in the library of the Royal Institute of British Architects on the 7th inst., Mr. C. C. Nelson in the chair. Mr. Arthur Cates, after referring with regret to the death of Mr. J. Wyatt Papworth, which had occurred on the preceding evening, read the annual report, by which it appeared that since the special meeting of 19th January last, by which the proceeding with the completion of the "Dictionary of Architecture," was authorised, the attention of the Committee has been devoted to the realisation of this object. To attain this the acquisition of funds has been the first requisite. Success has attended the exertions made to procure them.

To complete the text of the dictionary it was estimated that about £2600 would suffice, and to secure this amount 160 new subscribers for complete sets at £15 15s. each were required. Of this number 95 have actually paid the whole or part of the subscriptions, 17 others have undertaken to do so, and 48 only now remain to be obtained.

The balance sheets show that all debts and liabilities which had accrued up to Lady-Day last have been fully discharged, and that there is a cash balance of £1165 14s. 8d. actually in hand and available towards the completion of the dictionary; also a further sum of £446 11s. 6d. will be gradually received by instalments, thus providing a total sum of £1612 6s. 2d. to advance the text towards completion.

To provide the further funds required, 65 copies remain available, which, when all subscribed for, will produce £1023 15s., which it is calculated will be sufficient to meet the further expenditure required. 17 gentlemen (as above mentioned) have sent their names as subscribers, but from various circumstances have not yet remitted their subscriptions; when they have all done so, the 65 available copies will be reduced to 48. It is of considerable importance that these few remaining copies should be appropriated with as little delay as possible; and the interest of every member is so involved in the thorough success of the work, which has now so far favourably progressed, that the committee with confidence anticipate that it will soon be able to report that all the past year's works are out of print.

The subscribers are very much indebted to many of their number who have with generous activity contributed to the success now reported; and the Hon. Sec. would gladly receive suggestions and assistance from many others who have stood by to await the result of the movement, and by whose help the remaining copies referred to could be readily disposed of.

During the time occupied in collecting the subscriptions, arrangements were made for proceeding with the text of the dictionary. A considerable portion of the letter M has been printed. Of the remainder, part is in type or setting up. The first sheets were laid on the table for the inspection of the meeting, and as soon as sufficient is prepared to form a part it will be issued to those entitled to receive it.

The balance sheets were also read. The Hon. Sec. stated the summary of them to be that, after closing the accounts for the 18th and 19th years to December, 1868, which completed the dictionary up to the end of letter L, paying all liabilities up to that time, and also discharging the outstanding balances for reprinting certain portions of the work, and clearing the society of all liabilities and debts, there remained a balance in hand of £285 9s. 1d. to be carried forward; then, having carried that balance forward, the subscriptions received on account of the completion of the dictionary, and taking into account the expenditure of all kinds connected therewith, together with the organisation of this scheme, advertising, and other expenses up to Lady-Day last, the balance in hand stood at £1165 14s. 8d., of which amount £1100 stood in the name of the treasurer, on deposit account, in the Union Bank of London.

THE CORINTHIAN CLUB, LONDON.

A NEW club for the West End of London, under the name of "The Corinthian Club," situated opposite the Polytechnic Institution, Regent-street, has just been opened for the accommodation of its members. The premises were formerly occupied as offices by the European Insurance Company, and have undergone extensive alterations, and been entirely re-decorated by Messrs. Tridgell and Godwin, under the superintendence of Messrs. Hooper and Corpe, of Park Prospect, Westminster.

As now fitted up for club purposes, the entrance hall has been furnished with several groups of statuary, a prominent position being filled up with rockwork having running water, and a fountain, mixed with ferns and flowers. The public billiard room is a very spacious apartment, large enough to contain four or five tables. The walls have been coloured a pale apple-green, with buff coves to relieve the green, and bear a stencil ornament, of Egyptian red. This room is lighted from above by a lantern, the roof of which is of azure, with golden stars. There is also a private billiard room, in which the same style has been adopted. In the reading room the walls are of an oak colour relieved with crimson; and the friezes and mouldings, of the Corinthian order, are relieved with a coloured decoration. This room is lighted from above by a lantern of the same kind, and coloured in a similar manner to that of the billiard room. At night it is illuminated by two sun-burners. The dining room is of crimson, with gold mouldings, and niches at the four corners coloured a light green, and filled with statuary. The lantern and sun-burners are similar to those in the reading room. There are several private dining rooms in the upper part of the building, in which the principal noticeable features are the windows, filled with glass painted by hand by a new process, which leaves a washable surface, and is said to be very economical and durable. The effect produced is superior to diaphanie, or any imitation of stained glass we have yet seen. The kitchen arrangements are at the top of the building.

A peculiarity of the gas-lighting is that the whole of the burners throughout the building are lighted by an electric spark, and regulated by a small apparatus under the control of the manager. A great advantage of this method is that the long rods ordinarily used to sun-burners and lofty lights, can be dispensed with, and the whole lighting be under one control. The club is a proprietary concern, but placed under the management of a committee of gentlemen, and we are informed that it already numbers a thousand members, principally professional men.

◆

METROPOLITAN CEMETERIES.

THE question of closing the metropolitan cemeteries is one of vast importance, no only to the thousands who have friends and relatives buried in them, but to the numerous inhabitants of their vicinity. The *Gardener's Chronicle* calls attention to the fact that our suburban cemeteries are being surrounded by houses, and in a very few years will be as completely enclosed as any of our City graveyards. Whether we look to the East or the West, the same thing presents itself. Victoria-park Cemetery has long been completely enclosed, and its festering contents are still being increased, and still spreading the poisonous miasmata to the houses built against its boundary wall. Save on one side, which is occupied by a railway, the Tower Hamlets Cemetery is enclosed by houses built almost to the verge of the railings, and adds its reekings to the effluvia arising from the bone-boiling, fish-manure-making, and kindred industries of Bow-common, a moiety of which is now covered by habitations sheltering a considerable population. Brompton Cemetery is in a similar condition; Norwood and Nunhead are rapidly approaching it, and a great town is even rising up around Kensal-green. It may be true that everything is done decently and in order in these burying-places, and no doubt they are made pleasing to the eye by well-kept flower-beds and shrubberies. But, though doubtless a very proper way of treating "God's-acre," it is only an extra inducement to persons to visit the cemetery, as they might a park, and so breathe a greater quantity of the noxious exhalations than they otherwise would. We have no objection to the decoration of our cemeteries and graveyards with flowers, but we do contend that before this is done—or, rather, before the public is, in a manner, invited to visit them, proper precautions should be taken to prevent any effluvia arising from the decaying mass beneath. We shall have more to say on this subject.

◆

GOD HELP THE POOR!

DR. WHITMORE, medical officer of health for Marylebone, in his last monthly report, when speaking of the spread of scarlatina, says:—"In one particular house several deaths occurred, and although all possible means of disinfection were promptly resorted to, they failed to remove the disease altogether. Could I have treated this house as, from the intensity of the contagion, I considered necessary, I should have removed every inmate in it. I then could have employed those disinfecting agents which would have destroyed every germ of contagion, but the poor inmates had no other house to go to, nor could they find one. Hence it is—and it is lamentable to think that it cannot be otherwise—that the healthy and the infected are compelled to live together." He goes on to say, "I have recently had occasion to visit two houses in Tooting-court, which, from their extremely ruinous and dilapidated condition, I feel compelled to declare unfit for human habitation. In visiting the back yard of one of these houses, I found some bricks placed together, and evidences of a fire having recently been burning; I inquired the cause, and was told by an inmate that it was used for boiling the kettle, and for cooking, and on asking why the fire for such a purpose was not made in the house, I received this extraordinary answer—'They could not light the fire in the room, for if they did it brought the bugs out of the walls in swarms, and they were so troublesome that it was impossible to bear them.' This was gravely told me by a very decent old woman in the presence of other inmates. God help the poor creatures who have to endure such misery!"

A race-stand on Carlisle racecourse gave way last week, resulting in injuries (some very serious) to nineteen persons. It is said that the stand had been strong enough, but that it had not been properly "stayed."

Civil Engineering.

CONSTRUCTION OF DOLPHINS.

MANY of our readers will probably ask, What is a dolphin, and why is it so termed? With the latter part of the question we have at present nothing to do, not being concerned with the subject of derivatives. But to the former we reply, a dolphin is a timber structure of piles braced together so as to form a protection to a pier or landing-place in a river or the sea against the blows or collision of vessels. Small specimens of this particular class of construction may be seen by all those who are in the habit of going up the river in the iron steamers that run between London-bridge and Chelsea, but it is to the larger kind that we intend to direct attention. These are to be found in the vicinity of Gravesend, and are, many of them, very excellent specimens of timber framing and trussing. A general idea of the value, and, in fact, of the necessity of dolphins at the ends of piers will be obtained from an inspection of Fig. 1, which represents the plan of a pontoon and the adjoining dolphins. Let A be the upper dolphin, that is, the one situated at the up-stream extremity of the pier, and B the lower, or that at the down-stream end. The pontoon is divided by bulkheads (shown by the dotted lines) running transversely to its longitudinal axis. If we consider a large vessel to strike the lower dolphin in the direction shown by the arrow, and the collision be of a very violent nature, the following results will ensue. The dolphin B would be smashed up, taking the brunt of the blow. It would then be driven on to the pontoon, which, in its turn, would be forced against the upper dolphin A and displace it from the perpendicular position. In a recent accident of this kind this really occurred. The bracing and strutting in the interior of the pontoon was also very much damaged and broken. However desirable it might be, it would obviously be impossible to construct a dolphin so strong as to put the pier in perfect security. There is scarcely any protection that could be devised, except, perhaps, a solid mass of masonry that could resist the collision of a large ocean-going steamer. The impetus of a ship of heavy tonnage under sail or steam is something tremendous. The momentum given to the whole floating mass is almost irresistible. It was but the other day that a comparatively small vessel, a schooner, ran foul of a lighthouse and carried it away bodily, lantern and all, and sailed into port with it lying athwart her bows, to the utter bewilderment of the whole of the spectators awaiting her arrival.

The plan of a dolphin is triangular in shape, and its construction will be understood from the following description. It consists of three, four, or five stages, according to the height of the rise and fall of the tide, and Fig. 2 represents a horizontal section taken through a line just above the first or lowest stage. This sectional plan may be regarded as constant for any height of the dolphin, though sometimes the separate stages or tiers are not quite uniform in all the dimensions and scantlings of the timbers. Evidently the first step is to drive the piles, which are all whole timbers, not less than 14″×14,″ thus giving a sectional area to each pile of 196 square inches. Taking the crushing weight of good Memel at 6000lb. per square inch, each pile would stand a crushing pressure of over 500 tons. But it is clear that there is literally no vertical pressure upon the piles composing a dolphin. It has nothing to carry except a partial flooring and one or two lamps. The strength is required not to sustain a vertical load, but to give lateral rigidity and resistance, and here it is that the value of the trussing comes into play. A few piles by themselves have little or no lateral stiffness, but when properly braced and trussed together the whole triangular structure becomes uniformly resisting, and one part can scarcely fail without the other yielding as well. Thus, if a dolphin be bodily displaced from its vertical position, and not merely a portion of it, it may be inferred that the trussing and bracing of it has been well and scientifically accomplished. For if it were not so, one part would give way without communicating the strain to another, and the whole structure would be dismembered in a piecemeal fashion. As the piles are driven down to the proper depth they are connected by the waling and blocking timbers, and the different stages or tiers completed in succession. At intervals, cheeks are bolted on to the piles to strengthen them. These are usually from 12 to 15ft. in length, and are half timbers, similar to the piles themselves, being thus 14″ × 7″. The elevation in Fig. 3 shows the manner in which the strutting and bracing is arranged. At each stage a strong strap of iron about 5″×$\frac{3}{4}$″ is passed right round the whole triangular structure, and is bolted or fastened by spikes to each of the piles, as well as to the waling pieces. There is a large quantity of iron used in the construction of dolphins, as must necessarily be the case when timbers of the dimension we have described are framed together. Bolts or straps are generally employed in effecting the requisite fastenings and fixings. There is not much choice in the matter, as they both damage and deface the timber nearly equally. When straps are used, the bolts may be of smaller diameter than where bolts alone are employed, but as there must be more of them, little or nothing is gained by the substitution.

FIG. 1

PLAN

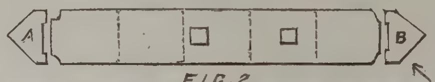

FIG. 2

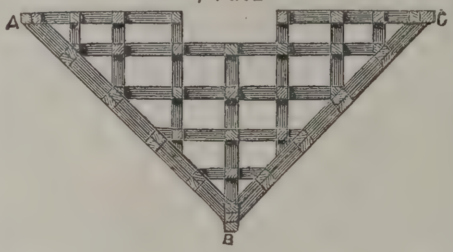

FIG. 3

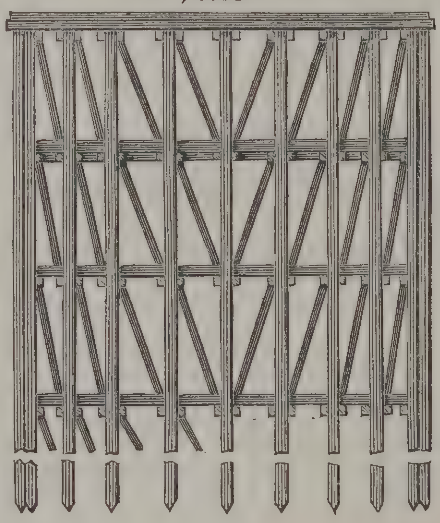

It is a question whether timber might not be advantageously replaced by iron in the construction of dolphins. In situations where screw piles could be rendered available, the change would undoubtedly be for the better, in consequence of the superior holding power of the iron pile compared with that of a timber one. But in places where the ground was not well adapted for this description of pile, it is probable that the timber structure would be found, not only the more economical, but also really more efficient. It must be borne in mind that the resistance of a dolphin is composed principally of two elements. The one is the holding power of the piles, and the other the weight, or, more correctly speaking, the *vis inertiæ* of the whole triangular mass. Supposing for the moment, the former quantity to be constant, the *vis inertiæ* of a timber dolphin would very much exceed that of a similar structure of iron, which would give an equal amount of absolute strength, or even rigidity. There are still a few instances where the superior weight of the material becomes a powerful advocate for its employment, although engineering skill and science are fast reducing these instances to a minimum.

NEW WATERWORKS FOR BOLTON.

NEW waterworks for Bolton are now in course of construction at Wayoh, near the Chapeltown station of the Lancashire and Yorkshire Railway. Several members of the Corporation of Bolton recently visited the works in progress, and an account of the visit in the *Bolton Chronicle* gives us an opportunity of briefly describing some of the principal features.

The *Puddle Trench* will, it need hardly be explained, form the foundation of the embankment which is to impound the water. The basin of the reservoir, which in shape will represent the letter Y—one fork extending a little beyond the Bradshaw Brook Viaduct, on the Bolton and Blackburn Railway, the other fork extending to Know Mill Bridge—is in other respects perfectly natural. Its capacity will be 555,000,000 gallons, or equal to that of the Entwistle reservoir—for taking which the Corporation are constructing the Wayoh works—a capacity which is equivalent to 4,000,000 gallons per diem, or nearly double that of the present water supply of Bolton. Messrs. Pollitt, the contractors, have experienced great difficulties in making the embankment and the puddle trench perfectly watertight. After piercing through about 6ft. of drift, composed of sand and gravel, they came to a bed of black shale, about 13ft. in thickness, which rested upon a thin vein of coal, 8in. in depth. Below this, again, were 6ft. of very fine white rock, which yielded a large quantity of water, and here the difficulties first began, it being necessary to keep two pumping engines constantly at work. After penetrating through this rock, 13ft. of grey "rag," or bind, was met with, which was very hard and a good deal broken up. Below this was another bed of coal, 6in. thick, which was succeeded by a very hard indurated clay, called by miners "warrant earth." The general dip of this strata is from west to east, at a slight angle. At some remote period the strata has been broken up and dislocated by some violent convulsion, either the result of volcanic action or of floods. The consequence is that in this formation there are two "faults": the first, which is on the east side of trench, is very small, and has simply thrown up the strata for about 16ft.; the other, however, is 80 yards in thickness, and the evident action of fire may be discerned in it. This "fault," which has precipitated the strata down towards the west to an extent not yet ascertained, is composed of a variety of metals, at all angles and inclinations, compactly wedged and cemented together by veins of clay and other retentive materials. At one time it was thought that this might be made available for the puddle trench, but after a very careful examination, Mr. Bateman, C.E., pronounced that it would be unsafe to trust to it, and he recommended the trench to be proceeded with. Perhaps no more adequate idea can be given of the enormous nature of this undertaking than by describing the dimensions of the trench. It extends entirely across the Wayoh Valley—the open portion of it being 200 yards in length—and it varies in depth from 45ft. at the Turton to 80ft. at the Edgworth end, while it is 20ft. wide at the top and 16ft. in width at the bottom. At the Edgworth end a heading has also been driven underneath the hill for a distance of 30 yards, a height of 110ft., and a width of 12ft., in order to prevent the escape of water round the end of the puddle gutter. The making of the puddle trench has occupied nearly two years; in about fifteen months, however, from the commencement, puddle was put in a part of the trench, and from January last the men have been filling the trench along its entire length. The filling in consists, first, of a bed of concrete, 3ft. in thickness, which is laid along the bottom; then upon this, on each side of the trench, 18in. rubble stone walls are being erected, and behind these walls 18in. of concrete is being placed. The space between the walls is being filled with well-worked puddle. It is not intended to carry the side walls up the whole height of the trench. Behind the puddle in the heading on the Edgworth or easterly side, 20ft. of concrete is being placed. It is anticipated that the whole of the trench will be puddled to the line of the ground by September next, after which the westerly or Turton end will be proceeded with. Immediately the trench is completed the contractors will commence the formation of the embankment. This will measure 320 yards in length, 70ft. in height, 140 yards wide at the base, and 20ft. wide at the top. It is expected that the work will progress at the rate of about 30ft. a year. It is possible, therefore, that the reservoir may be completed by the end of 1872. The whole number of men employed upon the works at present is between 120 and 130, of whom about sixty are engaged in getting and working puddle.

The *Gauge Basins* are situated in front of the outlet tunnel. In order to understand the precise purpose for which these basins are intended, it is necessary to explain that the Wayoh reservoir is for compensation only. It is, in fact, a substitute for the Entwistle reservoir, whose waters, on the completion of the works, will be used for domestic and trade purposes in Bolton and the neighbourhood. This compensation water is of two kinds: one to be delivered at the rate of 12 cubic feet per second into the Bradshaw Brook; the other, at the rate of 4 cubic feet per second, is to be conveyed in pipes to the several bleach and dye works on the stream between the reservoir and Tootil bridge, a distance of 4½ miles. The necessity for two ranges of pipes —each 2ft. in diameter—arises from the fact that the water supplied to the mills has to be pure. Of course the water impounded in the reservoir will be all clean, inasmuch as the only works contaminating the Wayoh stream are the Know Mill Print Works, from which a goit has to be constructed to convey their dirty water into the brook below the gauge basins. To enable them to deliver this water to the mill owners, and in order that there might be no break or opening in the embankment, the Corporation have constructed a brick tunnel underneath the hill on the Edgworth side, called the outlet tunnel, which is 440 yards in length, 12ft. high, and 10ft. in width, through which the compensation pipes have been laid. For enabling the water to be regularly delivered, two sets of gauge basins have been erected at the outlet of this tunnel—and below the embankment —each containing three chambers 19ft. long, 15ft. wide, and 10ft. deep, constructed of massive masonry, with brick inverts. The first or easterly range of pipes will deliver the larger quantity of water—12 cubic feet per second—into the first of one of these series of chambers, from whence it will pass by an opening at the bottom of the cross wall into the second or measuring chamber, and from thence into the third chamber along a conduit 65 yards in length and 15ft. in width, over a weir of solid masonry into the brook, or through a sluice gate into the lodge of Messrs. Dearden, as they may require, they being the first takers. The second or westerly range of pipes will deliver the smaller quantity of water—4 cubic feet per second—into the second series of chambers, in the same way as before, with the exception that in the third chamber the water will be impounded, so as to charge the pipes through which it is to be delivered to the works on the stream. An ample storm overflow has been provided, and the whole of the works are fine examples of masonry. The outlet tunnel—through which the Bradshaw and Wayoh streams are now diverted pending the construction of the works—is entirely completed, with the exception of its southern face. One set of valves has also been placed upon the compensation pipes, but another set will be required at the southern end, and also valve columns at the north or inlet end of the tunnel, in order to enable the water to be drawn from different levels. One set of gauge basins is also finished, with the exception of the cross-wall; and the other set is three parts completed. The retaining walls enclosing the basins have likewise been erected, with the exception of the coping; while the conduit, weir, and storm overflow are all finished.

The *Entwistle Tunnel*, at present in course of construction, has its opening at the foot of the high land to the right of the embankment of the Entwistle reservoir. It will be about 3000 yards long, for two-thirds of which distance it has already been driven—1000 yards at the Entwistle end, and an equal distance at the Egerton end. Men are constantly at work in it day and night, but as the tunnel has to be driven entirely by means of blasting, the progress is necessarily slow. It is, however, expected to be completed by the time the Wayoh reservoir is ready, when the water from the Entwistle reservoir will be conveyed through it into basins at the Egerton end, and thence through pipes along the road to Dunscar, and across the fields to the Sweetloves reservoir. These pipes are already laid, and are at present used to convey the water from the tunnel to Sweetloves. The appliances for ventilating the tunnel during its construction are similar to those used in mining operations. A series of pipes is laid along the tunnel to the face of the rock where the men are at work, through which the foul air is carried by means of a furnace at the bottom of a ventilating shaft a short distance from the mouth as the fresh air rushes up the tunnel.

The works have been designed by, and are being carried out under the superintendence of, Mr. H. Baylis, C.E., the Borough Engineer, at a total cost of £170,000.

NATIONAL ENGINEERS' ASSOCIATION.

THE annual meeting of the Batley (Yorkshire) branch of this association took place on Satnrday, at the Royal Hotel in the above town, and a large number of members were present. Mr. John Redfearn presided. Mr. Wm. Winn, the secretary, read the report of the year's proceedings, and stated that the operations of the society extended over the whole of Lancashire, Yorkshire, and Cheshire. He remarked that it was truly alarming to hear of the various accidents that took place through the bursting of steam-boilers; but there was cause for thankfulness in this, that though there were 3000 in the care of 1050 members of the National Engineers' Association, only one boiler had exploded. He attributed this to the care exercised by the members, and to the knowledge they had acquired of the properties of steam and iron. The report was adopted, and afterwards Mr. Harraud, of Heckmondwike, Mr. J. Meson, Mr. F. Meson, and other gentlemen addressed the meeting.

◆

ST. SAVIOUR'S CHURCH, EASTBOURNE.

THIS church was built in 1866. It consists of a nave 36ft. × 92ft., aisles 10ft. wide, and a chancel 22ft. × 33ft. The nave ends at the east in an apse, the central arch of which opens into the chancel. The nave aisles are continued round its apse, and projections from them are formed for organ and sacristy. The chancel is groined with a brick and stone vault; the nave has a boarded ceiling, which is intended to be painted shortly. The chancel walls have lately (1870) been arcaded, and an alabaster reredos erected at considerable cost, and the steeple shown in the drawing is also just begun, Mr. Peerless, of Eastbourne (who built the church), having taken the contract for £3500. This steeple is 24ft. square at base, and 165ft. high to top of spire. The lower stage is groined; above this groining is a parish room, and over this again the bell-ringing floor. The whole will be executed in the same materials as the church—red brick with stone dressings.

The special feature in this church is the planning of the interior, which is so contrived as to make the altar and choir easily visible from all parts. The cost of the church, exclusive of the steeple, was about £7500, and it accommodates from 900 to 1000 persons. Mr. G. E. Street, A.R.A., is the architect.

◆

THE INSTITUTION OF CIVIL ENGINEERS.—In the last ten years the numbers of the several classes belonging to this institution have been more than doubled. For whereas on the 30th of November, 1860, the gross total of all classes was 930, on the 1st of July last it stood at 1894. At the former date there were 24 honorary members, 355 members, 537 associates, and 14 graduates; now there are 16 honorary members, 702 members, 999 associates, and 177 students.

Furniture & Decoration.

ON THE USE AND ABUSE OF ORNAMENT AND COLOUR IN THEIR APPLICATION TO HOUSE DECORATION.

(*Continued from page* 5.)

WHITE and gold is a favourite style for drawing rooms, and is considered to be in the purest taste—we confess we don't think so. Large rooms of unrelieved white with heavy deep gold mouldings do not appear to us to be in good taste. If the absence of colour is pure taste, then hurrah for whitewash, pure and undefiled! To us white and gold alone has a starved, poor look—very cold, and certainly not harmonious. The gold and white do not blend; the one seems independent of the other; in fact, the gold appears to be there to tell one at once, and very plainly too, that it is put there solely for the sake of its glare and glitter, and not as a part of an harmonious whole. In any decorative combination of tints, gold leaf should take its place as a colour, having its due weight in the balance, and no more. Used thus it will never be obtrusive, but help to produce richness without vulgarity, glitter without tawdriness, repose without dulness. Where pure taste is exercised, gold leaf will be used sparingly, for there is no stronger evidence of a vulgar taste than a too profuse use of gilding in decoration.' Any one may produce a gorgeous effect by a prodigal use of gold and colour, but the true test of the decorator's art is to produce a rich and harmonious effect without the aid of gold leaf. Instead of white and gold we prefer to have the doors and all other wood-work in the drawing room painted in tints; or the panels, mouldings, and quirks tinted, and the stiles white; by adopting this course we still retain its purity, but add warmth and harmony. The panels may be painted either with floral arabesques, or simple lines and ornaments, in quiet, pure tones of colour. If with flowers, they should be properly supported by springing out of some object—a vase, a husk, &c.—as a natural outflow from the general design of ornament. We object altogether to bouquets of flowers tied to nothing with ribbons, and supported by nothing. We were looking at a room in a magnificent old mansion a few days ago, done in this style. The walls were white on what had originally been panelled wainscot. On the panels were bouquets and pendants of flowers (not wreaths or festoons), exquisitely painted and surrounded by heavy gilt mouldings. The flowers had nothing to support them, and were tied up with ribbons that had nothing to hold by. The effect as a whole was very bad. Had they been real flowers they would have been held up in some way, but being painted ones we presume the artist felt sure of their sticking where he put them. Now had these beautifully-painted flowers but formed a part of some well-considered design, how different the effect would have been! It does not follow that because the work is well executed it is necessarily in good taste; this is not so. Mere manipulative skill, although indispensable in the execution of all good work, is the result of practice. Taste and judgment are much higher qualities, and very rare, and may be possessed in a high degree without the possessor having any manipulative skill whatever, but when all these qualities are combined in the same person, successful works must result.

In some of the best class of drawing rooms the woodwork is got up in polished white enamel, that is, a mixture of white lead with varnish that dries hard. Several coats of this is given to fill up the uneven parts; it is then rubbed down with lump and ground pumice stone and felt, until level and smooth; it is now varnished three or four times with varnish and flake white, and when hard cut down with felt and ground pumice stone in water, and polished by the hand. If this is got up properly, and well polished, the effect is good, but the cost is enormous, in consequence of the large amount of labour required to work it; and we have very considerable doubts as to whether it is worth the trouble and cost when it is done. The advantage in point of appearance and durability is so small over ordinary flat or dead colour that we are inclined to think that the extra cost and labour are thrown away. And it is quite certain that the colour is not so pure, as there is no varnish made which can be mixed with pure white without injuring its purity; however well and carefully it is done it will turn yellow. To obviate this in some degree, we make a practise of painting the mouldings of a white enamel door of a cream colour, flat or dead. This serves two purposes, its yellowness causes the white to look whiter, and its want of gloss makes the polished enamel to appear to have a brighter lustre. Good enamel painting is a legitimate aid to decoration, but we must utterly condemn the host of paltry imitations to which it has given rise—enamel paint, and varnished enamel. White paint is varnished, and so left without much labour being bestowed upon it, to make it level and smooth, and it is then called white enamel. Its whiteness or pureness is a myth, to begin with, and in course of a month or two it turns a dirty yellow. Such work cannot be too strongly condemned.

The imitation of woods we think to be out of place in a drawing room, except elaborately inlaid work; but in a large drawing room, in which pilasters or columns form a part of its constructive features, imitations of light-coloured marbles may be used with propriety, if well done—not otherwise. Drawing rooms are sometimes painted in the Pompeian style. But we consider this to be a mistake, and out of keeping with our climate and habits. The morning room or breakfast room should be treated in a cheerful style, warm and comfortable. The woodwork may be grained any light, clean-looking wood, or a well executed imitation of inlaid woods, all good and serviceable of its kind; above all things it is necessary to avoid a depressing dullness in such a room. When we enter it in the morning, all should look bright and cheerful, and in accordance with the good things spread out for our use. Such a room judiciously coloured gives zest and relish to our food, and soothes our tempers. With regard to the decoration of the hall and staircase, much depends upon its size, style of architecture and general character. The Greek, Italian, and Roman styles admit of marbles being used as a lining for staircases. In our Northern Gothic houses it was rarely used for that purpose, but was used as an inlay in stone, a style of an eminently decorative character. On the walls of a grand hall and staircase, we know of no style of decoration so much in accordance with its grandeur as marble, veneered with the real marble if possible, but if that is unattainable, a good imitation may be used with propriety.* Mr. Crace, in his recently published lecture on Art Training, suggests that the walls of staircases should be stencilled with a pattern in quiet colours. We cannot see the wisdom of such a course. We rather think the staircase would look too much like the rooms, which, as a rule, are covered with patterns of some kind, and consequently we want something different as a relief or change, which constitutes the great charm of contrast in treatment between one room and another. The staircase ought in all cases to be essentially different in its treatment to any other part of a house. Its decoration should be as different as its structural features are to the rest of the house. Again, Mr. Crace [says the introduction of shams—*i e.*, imitations of marbles, is always of doubtful propriety, but may do now and then, if the architecture of the staircase is well adapted for such treatment. Now we hold that it is either right or it is wrong to use imitations, and the fact of the staircase being suitable or not does not affect the question in the slightest. If it is right to use them at all, it is right to use them everywhere where real marble would be used by the architect. If it is wrong, do not use it at all. Don't let us affect to despise and condemn it, and yet use it. Do let us act consistently. A good deal of what our Transatlantic friends call "bosh" has been talked about the question of what are called shams.

There are several marbles which are well adapted for use on large surfaces, the principles of which are—Sienna, Italian pink, or Breeche, Breeche voilette, Bardiglio, white, white vein, and the granites.

In painting imitations of marbles on staircase walls, it is always advisable to make choice of a medium tint of the marble to be imitated, that is to say, there are certain blocks and slabs of (we will say) Sienna marble which are less strongly marked than others, both in vein and colour. These are better adapted for painting than the darker parts, inasmuch as they allow of a more uniform tone of colour being kept throughout. Nothing looks worse than to see one block or slab strong and dark, and the next light and faintly marked. Mr. Pitman, in a paper read before the Society of Arts, and published in The Building News, calls Sienna a billious-looking marble on account of its yellowness, and objects to its use for that reason. He has evidently formed his opinion from the study of the paper-stainer's rendering of Sienna marble, and, as far as these are concerned, he is right, but real Sienna is a most beautiful and valuable marble for the purpose, having a play of colour not found in any other marble. Yellow or yellowish drab is the prevailing colour certainly, but this is mixed and blended with such a variety of tints of pinks, greys, browns, blacks, blues, and purples, that the yellow is sobered down, and made into a perfectly harmonious whole. Another admirable marble for walls is named Italian pink. It is an adaptation of the lighter parts of the Breeche marbles, and the darker sorts of the same marble are very suitable for columns, pilasters, &c, The geological character of these marbles is very interesting. They seem at one time to have consisted of extensive layers or strata of petrified rock, which by some convulsion of nature has been broken up into all sorts of irregular pieces, such as we see when ice is broken up. The smaller pieces seem to have floated in between the larger ones, filling up the interstices, and then been again petrified. Italian pink differs both in form and colour from Sienna, the prevailing colour of the former being of a pleasant pinky hue, beautifully marked with black, blue, mauve, light red, and yellow veins, many parts having the appearance of the markings on some kinds of shells. When it is well and carefully done, on a good staircase, and in large blocks or slabs, we are inclined to prefer it before Sienna.

The Breeche violette is similar in form to the other, but is of a warm grey tone. The other marbles suitable for walls are so well known that we need not describe them here. Vestibules or entrance-halls are often done in imitation of inlaid marbles, which, when well executed, is an admirable style of decoration for this purpose. Much care and judgment is required in the selection of the marbles, and the choice of a suitable design. Designs for the inlaying of marbles should be very different to those which are used for inlaying of woods. This is necessary from the difference of material, and should always be kept in view in getting out designs for either. It will be evident to the plainest comprehension that almost any pattern, however intricate, may be cut out of thin veneers of wood with the greatest ease, when the same patterns, cut out of marbles, would entail an immensity of labour and an enormous cost; and many patterns could be cut out of wood which could not be cut out of marble. Therefore, in marble, breadth and simplicity should be aimed at, and only such designs adopted as might be used by the marble mason, which are principally geometrical patterns, formed of strap work, circles, octagons, pentagons, hexagons, &c. In petra-dura work, we have other forms, such as birds, flowers, &c., but these are the exceptions, and not the rule, therefore we do not take them into consideration here. In the setting out of the design for a vestibule wall we have found the best form to be a centre panel of either Sienna or Italian pink, or other light marble, with a strap work border of Broccatella, interlacing at the corners and centre, enclosing narrow panels of Rouge Roi, or S. Remy blue, with a stile of one of our English serpentines, of a green colour The strap or band may be two inches wide, the rouge panel four or six inches, and the strap again two inches, making altogether ten inches. The stile may be from five to eight inches wide, according to the size of the wall. The small centre panels enclosed by the interlacing band may contain either a monogram, a crest, or a shield. There are, of course, an endless variety of patterns which may be used for this purpose, always keeping in mind the caution before given as to simplicity and suitableness. Much of the prejudice against the use of imitation marbles has arisen from the use of marbled paper-hangings, the majority of them being such gross caricatures of the marbles they profess to represent; and even the best of them are so utterly inferior to really first-class painted marble, that no comparison can be instituted between them. A wall covered with paper never can have that evenness of surface and smoothness of finish that a painted wall properly prepared has. Consequently we see at once that it is paper. which fact destroys all illusions at once. If we can see at once how an effect is produced, that effect will not be near so pleasing as if the manner of its doing is effectually concealed; the greater and more complete the deception, and the more pleasure and wonder it excites, the greater the pleasure we receive from its beauty. Unfortunately this is the case with many other things in this life; once we get behind the scenes, the enchantment is dissolved. This is a low grovelling passion, according to Ruskin, and not worthy of the labour it involves. Be this as it may, it is at all events a pure pleasure we receive—an innocent enjoyment, leading to a better and higher appreciation of the beautiful and good.

Another good style of treatment is to panel vestibule walls with lines and flat ornaments, and borders stencilled in quiet neutral tints, in accordance with the style of the architecture.

The staircase may be treated in the same manner, or it may be painted dado high, with two shades of the same colour, the darkest tint about three or four feet above the skirting, and a suitable border stencilled upon the line of division; or the stencil may be divided: a black or dark-coloured border may be stencilled upon the lower, or dark colour, and a line and stops, or small repeating ornament, upon the upper or lighter tint, in any properly contrasting colour, or it may be done with the same colour as the dado is painted with. A good effect may be got by stencilling a diaper upon the dado of a darker or lighter shade of the same colour, with a border of course, but we object altogether to the upper part being treated in the same manner, thus making too busy what ought, in reality, to be a relief and contrast to the rest of the house. Nothing can be in worse taste than to cover every part of our houses with busy ornament, creating a feeling of unrest and oppression utterly opposed to the true principles of decorative art.

(*To be continued.*)

◆

The memorial stone of a new Wesleyan chapel was laid at Lynton, Devonshire, on Tuesday week.

---

*Of course it will be understood that we are speaking here of strictly decorative treatment.

BAYHAM AND OTHER ABBEYS.

THE ground plans of the Præmonstratensian order were irregular, although the usual conventual arrangement was preserved. By the kindness of the Marquess Camden, Bayham Abbey, as traced by Wilkins, is now laid before the public. At first sight we are reminded of Clugny, with its vast ante-church, and of Lewes, but a careful comparison with other houses modifies the impression. A complete church, with aisles walled off from the nave (as in the choir of Rochester), an aisless eastern arm, and a transept with two chapels in each wing, is before us, with a sacristy to the south arm. Here naturally would follow the eastern range of buildings in the cloister garth, but these have been transferred, no doubt, from exigencies of the site, to the western end of the actual church, and an ingenious contrivance links them together. The wall of the south nave aisle has been removed to make room for two long chapels; then to the south are the chapter-house and dormitory over a calefactory. On the south side of the garth are a parlour and refectory, on the west a slype and guest-house. The north side presented a serious difficulty in the way of access to the nave. It was, however, overcome by erecting a long galilee, only 25ft. in width and 50ft. high, to the wall plate, along this side of the cloister, with the two ordinary processional doors. The architectural nave formed the ritual choir. There is no triforium.

The similarity between the claustral buildings of Bayham and Leiston is at first sight perceptible; and another similarity links Wendling, Eastby and Leiston together—the aisleless-choirs; and Wendling and Eastby have also in common a large adjunct or chapel (probably dedicated S. Mary) at the N.E. side of the nave. At Eastby a similar projection at the S.E. has utterly distorted the cloister garth. The refectory is in two alleys, and the dormitory ranged over a similar cellarage. The rare trigonal apse of Bayham should be noticed. Similar terminations occur in the Friar's Church, Winchelsea, the Friar's Chapel, Brecon, and in other places mentioned in my "Sacred Archæology."

Unfortunately we have no details of the internal arrangements of Bayham. About the year 1200 the site for Beaulieu, as it was called at first, was given by Sir Robert de Turnham. From an indulgence dated 1254 we know that the buildings were still in progress. In 1484 the visitor ordered important repairs to be made in the ruinous dormitory, refectory hall, and bakehouse.

The entrance gateway still remains. The base court has wholly disappeared, but we may conjecture its appearance from the fine quadrangle still in existence at Ardaines, near Caen, which exhibits a noble gatehouse on the west, a superb barn with three alleys, and buttressed two-storied farm buildings adjoining it, and upon the south side. At the east there is portion of a building forming part of the cloister garth, and the splendid west front of the nave.

The Præmonstratensian, or White Canons, stood in the same relation to the Austin Canons as the Cistercians did to other more isolated communities, stricter in discipline and devoted to agriculture and husbandry. Their jealousy of neighbours is evidenced by an agreement in the Chartulary drawn up between Bayham and Robertsbridge, to the effect that neither order should erect a place, cell, or abbey, within four leagues of the house of the other. The order was founded by Norbert of Lorraine, Bishop of Laon and Archbishop of Magdeburg, in the 12th century. It adopted the Austin Rule, and from a legend of a miraculous designation of the earliest site for an abbey (præmonstratum, foreshown) derived its name. Calixtus II. or Innocent II. confirmed the rule. They were called at first Canons Regular Exempt, and afterwards White Canons, from their dress—a white tunic, gown, and mantle, which Honorius IV. granted them, to the great disgust of the Carmelites. The abbotts never used mitre, or staff ring, or other pontifical ornament. They were forbidden to have game preserves, and they had no schools. In 1145 they established their first home in Newhouse, in Lincolnshire; in 1250 the aged bishop of the diocese actually travelled to Rome to complain of the irregularities of the order, which in 1497 became secular.

It is recorded that the Canons were so highly regarded by the peasantry that at the Dissolution, on their first expulsion, a company with painted faces and visors drove out the commissioners and replaced the white brotherhood, not long, however, to retain their ancient house. The abbey site is now beautifully kept with a loving care.

BUILDING NEWS SKETCH BOOK.-XXXV.

TOWER GATEWAY, LEIGH'S PRIORY, ESSEX.

THIS priory was founded in the reign of Henry III., but with the exception of some few pieces of rubble work, the existing buildings consist of brickwork with stone dressings, and moulded and glazed bricks used in for ornamental purposes. At the Reformation it was seized on by Sir Richard Rich, who made it, as the villagers said, "a paradise upon earth." The arms and crest of his family, with the motto, *Garde Ta Foy*, are carved over the tower doorway. Later on it fell into the hands of the Governors of Guy's Hospital, who pulled the house down, the buildings now remaining being the tower the subject of the sketch, and a large range of picturesque buildings in front of and forming a large courtyard with it. It is situate about 8 miles from Chelmsford, in a hollow, the ground rising on all sides, so that the visitor does not see its noble proportions, and the varied colours age has given to the brickwork, until close upon it. W. E. Brown.

THE COMPLETION OF S. PAUL'S.

THE meeting at the Mansion House on Wednesday for the inauguration of a great effort to complete the decoration of the interior of S. Paul's, was successful. A list of subscriptions amounting to between £24,000 and £25,000 was read, and the proceedings throughout were enthusiastic. Mr. Gladstone's speech in support of the first resolution was in his best style, and his reference to Cardinal Wiseman's well-remembered rejoinder to a modern writer who criticised the heathenish emblems on the Pantheon was thoroughly to the purpose. It was, as Mr. Gladstone said, a rejoinder which made the "blood tingle and the cheek flush." "You talk," said the Cardinal, "of the emblems in the Pantheon. What are the emblems that appear in S. Paul's—for the worship of what deity was that noble temple erected? how often is it applied to the celebration of religious rites—what indication does it carry in the symbols found there of the character of the Christian Gospel? Look at the monuments with which its walls are studded—the emblems found about them are but little likely to give rise to the reproach of an exaggerated Christianity, or to the idea that they were erected to those whose names are recorded in Gospel history. It is the drum, the trumpet, and the cannon—every sign of civil and secular life—with which alone you have ornamented your cathedral, while in every respect it remains, except as to its noble fabric, perfectly dumb and incapable of expressing the purpose for which it was intended." To the complete avoidance of a state of things deserving a repetition of this taunt the efforts of the Dean and Chapter are now directed, and all Churchmen—nay every Englishman—to whom, as the resolution moved by Lord Carnarvon well puts it—"The cathedral is as much his own church, as each single church in the land is to its own parishioners," should by all means in their power endeavour to ensure their success.

SUFFOLK ARCHÆOLOGICAL INSTITUTE.

THE following is an abstract of a paper on the Parish Church and the Remains of the Priory Chapel at Isleham, read by the Rev. J. Denny Gedge during the recent visit of the Suffolk Archœological Institute:—

The *Church*, which is dedicated to S. Andrew, is the work mainly of the fourteenth century. It was begun in Decorated and finished in Perpendicular times, and is for the most part transitional in character. It comprises chancel, nave, two aisles, and transepts. The east window of the chancel consists of five lights, and has much of a Decorated character; the side windows are of the same date, as is also the lean-to vestry. On the south side is an angular piscina, and a wide seat for sedilia of the same period; but the stalls and misereres are plainly Perpendicular, whilst the altar rail is of the time of Elizabeth. On the north of the chancel, under a flat arch, enriched, as was also the rood-screen recently removed, with quatrefoils and foliated work, is a fine altar tomb of Purbeck marble to Sir Thomas Peyton, Knt., who died in 1484, and his two wives. Their effigies are engraved on brass, and have elegant canopies. On the north wall of the chancel was discovered an interesting mural fresco of the Virgin and Child, which has now been covered up. The chancel arch is lofty and wide, and evinces a slightly later date than that of the east window. The nave is of five bays, and has piers and arches of the same date as the chancel arch, the piers being formed in clusters of four columns, with a boltel between them. The most remarkable feature of the edifice is the deep and rich panelling of the spandrels of the nave, which are surmounted by a well-designed cornice-string and battlement. The fine and lofty clerestory is the latest part of the church, and, with the roof, is purely Perpendicular. The space between the tie-beams and principals is filled in with tracery, and there are the usual carved angels for hammer beams. An inscription round the roof tells us that it was erected by "Crystifer Peyton, wych dyd mak thys rofe in the yere of our Lord MCCCCLXXXXV., beyng the X yere of Kynge Henry the VII." The north transept has a good sepulchral recess, well moulded and crocketed, with a figure in plate armour much mutilated. In this transept, to the south-east, is a single piscina, Decorated in style, which still bears traces of having been coloured. The south transept is Early Perpendicular in character. Here, also, is a sepulchral recess with a mutilated figure. This transept was formerly a chapel dedicated to S. Catharine. The octagonal font, with its deeply-carved panelling, is a fine specimen of Perpendicular work. The lectern is in the form of a brazen eagle, and is unusually good in its workmanship. There is a large porch to the south, of a Transitional character. The benitier, now filled up with masonry, still stands in its place. The tower is modern, replacing one which fell in 1862. It was known to have been split by lightning long before. Workmen were engaged in its repair at the time of its fall, but received timely warning of their danger.

The *Priory*, dedicated to S. Margaret, was a cell to the Abbey of S. Jacutus in Insula, in Brittany. It is evident from existing documents that it was still occupied in 1219. Probably the monks removed in 1254 to Linton. The moat of the old priory may still be traced in the meadows to the rear of the chapel.

The *Chapel* itself, now used as a barn, is of Late Norman construction. The east end is apsidal, and is supported by curious small narrow buttresses, diminishing in stages. In the interior we find a fine circular arch at the entrance to the chancel, and the piers and springing of another at the entrance to the apse. The windows of the apse take the form of very small and narrow loop-holes, deeply splayed to the interior. At the west end is one window of like character, and two circular openings higher up towards the roof. The south doorway is of the square-headed trefoil shape, while that of the north is Transitional Norman. The masonry of the walls deserves examination, since it consists chiefly of rude herring-bone work, such as we find employed during both Saxon and Norman periods, and is done in rough stone, alternating with tiles.

ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETIES.

Cumberland and Westmoreland Archæological Society.—A meeting of the members of this society was held on Thursday week in the Music Hall of the Athenæum, Maryport. The last meeting of the Society was held in 1868, and as the Society had been in a state of suspense for a year, and the treasurer had a balance in hand of £283, he proposed that no subscriptions should be paid for the last year.—Mr. C. J. Ferguson called attention to a portion of the Roman Wall which had been discovered near Pike Hill, between Lanercost and Birdoswald. He suggested that the society should pay for the diversion of a road near the place, in order to procure the remains.—Dr. Bruce of Newcastle said that, so far as he could judge, the place referred to was the site of a Mile Castle, and, further, it was a castle of considerable interest. There were three altars, one of which was at Lanercost and two at Rockliffe. It was desirable, therefore, to keep the site, so that it may be recognised. It had some peculiar features about it. It occurred to him that this Mile Castle had had its corners rounded off on the north side as well as the south side. The south corners are always rounded off, but not the north corners. The peculiarity to which he had referred shows that the castle had been built first, and the wall run into it. As the site was one of historical importance, it was desirable that it should be permanently retained.—A sub-committee was appointed, with power to expend a certain sum in the purchase of the site, which belongs to Lord Carlisle.—The members and their friends then left the Athenæum, and, under the guidance of Dr. Bruce, proceeded to visit the Roman camp, and the field, not far distant from it, where the recent valuable find of Roman altars was made. The party next proceeded to Netherhall, the seat of Mr. J. P. Senhouse, near to which a pavilion was erected. At the front of the pavilion the whole of the altars recently discovered were placed, and numbered in the order of the finding. After the visitors had examined these interesting and valuable relics of a bygone age, Dr. Bruce proceeded to read a paper concerning them.—On the motion of the Rev. J. Simpson, seconded by Dr. Ainger, a vote of thanks was given to Dr. Bruce for his paper, and three hearty cheers were given in his honour.

Durham Archæological and Architectural Society.—This society had a very enjoyable two days' excursion on Thursday and Friday week, to Lanercost and the Roman wall. The first place visited was Naworth Castle, of which a short account was given by Mr. Ferguson, of Carlisle. The party then proceeded to Lanercost Abbey, where a very able and exhaustive paper was read by the same gentleman. From Lanercost the members were conveyed to Gilsland Spa, passing on their way a very interesting specimen of the Roman Wall, lately discovered. Thirlwall was visited on Friday, from whence members followed the course of the Roman wall to Housesteads.

Kent Archæological Society.—The annual meeting of this society is fixed for the 3rd and 4th of August, at Sittingbourne. On the 4th there will be an excursion to the island of Sheppy, Minster Church, and Shurland Castle.

A gathering of the members of the St. Alban's Archæological and Architectural Society will take place on or about the 21st of the present month, when it is proposed to hold two meetings, and have an excursion. The *Herts Guardian* says it is a pity that the Society does not enlarge the sphere of its operations to the entire county."

The Sussex Archæological Society will hold its annual meeting at Rye on Thursday, August 11.

◆

PARLIAMENTARY NOTES.

The Ladies' Gallery.—Mr. H. Samuelson, on Thursday week, asked the First Commissioner of Works how soon increased accommodation and improved ventilation would be afforded to the Ladies Gallery, according to his own promise and to that of his predecessor in office.—Mr. Ayrton hoped the estimate for the Houses of Parliament would be laid on the table in two or three days; and as soon as the money had been voted by the House the works would proceed.

The Gas of the Metropolis.—Mr. Lefevre (in reply to Mr. T. Cave) admitted the extreme advisability of uniform gas legislation for the metropolis, but was unable to pledge the Government to bring in a Bill for that purpose.

The Thames Embankment.—On Friday last Mr. W. H. Smith asked the House to adopt an address to the Queen, praying her to direct that no public offices should be erected upon the portion of the Thames Embankment, between Whitehall-place and Charing-cross, which had been reserved to the Crown; and this demand, in which he was supported by Lord Enfield and Mr. Baillie Cochrane, he rested in the main upon the ground that the land referred to had been reclaimed at the expense of the ratepayers of the metropolis, and ought therefore to be retained for their benefit and enjoyment.—Mr. Lowe replied that the two-and-a-half acres of land referred to had been secured to the Crown as compensation for the surrender which it made of its riparian rights, in order that the Embankment might be carried out for the benefit of the metropolis; and he therefore maintained that it was completely and thoroughly the property of the Crown, as the representative of the nation, to be applied to any purpose that might seem desirable.—Mr. Hope did not deny that the Crown had a right to build upon this this piece of ground; but maintaining that it was an unsuitable situation for a War Office, suggested that it might well be occupied by the Natural History Museum, for which a site was greatly wanted. A portion of his argument was drawn from the report of the Committee upon the concentration of the public offices, and he significantly observed that "in those days enlightened and public men were the Commissioners of Public Works."—Mr. Crawford, Mr. Samuda, and Mr Bass urged that as this ground had been reclaimed at the expense of the ratepayers of the metropolis it ought to be kept free from buildings, for their benefit; while Mr. Rathbone maintained that if national property of the value of £150,000 was to be given up as for the benefit of the metropolis, the national exchequer ought to contribute at least half that amount to enable Liverpool to provide itself with recreation grounds, and this expression of opinion was loudly cheered by the representatives of many provincial towns.—The Prime Minister characterised the proposal of the member for Westminster as an attempt to revive the old bad practice of making grants for the improvement of the metropolis out of the national resources—which if renewed must be extended to other places as well as London—and, after taking several legal and constitutional objections to the form of the motion, recommended Mr. Smith to wait the proposals of the Government with reference to the disposal of this land before he asked the House to pronounce any judgment upon the subject.—Mr. Locke was energetic and humorous in his vindication of the rights of the inhabitants of the metropolis; and created much merriment by the assertion that in this country no building is ever erected which does not deface the ground upon which it is raised.—The motion was opposed by Mr. Cowper-Temple, and supported by Lord J. Manners; and Mr. Walpole made a most effective point by comparing this land to an Irish estate, the value of which had been increased by the improvements made by the tenants.—Several speeches on both sides of the question were addressed to a House which became more and more impatient and more and more noisy, until at last a division was taken, and the motion was carried by 50—156 to 106.

Ornamental Water in the Parks.—Mr. Harvey Lewis, on Monday, asked the First Commissioner of Works whether his attention had been called to the offensive state of the ornamental water in the Regent's Park, and, if so, whether he would cause immediate measures to be taken to purify it. He also asked whether he would lay upon the table of the house the copy of a letter, dated the 8th instant, addressed to him upon the offensive state of the ornamental water in the Regent's Park by Dr. Whitmore, medical officer of health for the parish of St. Marylebone. Mr. Ayrton replied that his attention had been called to the condition of the water in question. The offensive state of the water was occasioned by its being shallow and of a uniform depth. (Laughter.) The only remedy for the evil was to deepen the water, and he had given orders that it should be carried out. He had no objection whatever to lay on the table the report of the medical officer.—Sir Lawrence Palk inquired if any steps were likely to be taken to remove the mud from the Serpentine.—Mr. Ayrton said the subject was under consideration, and Government would act upon the advice of those qualified to advise them on the subject.

Sunday Labour on the Thames Embankment.—Mr. J. Talbot inquired whether the Government were aware that workmen were employed on Sunday on the Thames Embakment, near Westminster-bridge, and if so, whether they sanctioned the employment of workpeople on public works on Sunday.—Mr. Bruce said he was not aware of the fact until it was mentioned in a private communication from his hon. friend. The Government were not in any way responsible for any proceedings on that work. They had, however, communicated with the Chairman of the Metropolitan Board of Works, and he stated that the work was done on the sole authority of the contractor, and that if he had been informed of the intention he would have done his best to prevent it from being carried out.

Carriage-way through S. James's-park.—Mr. Cadogan asked the First Commissioner of Works whether, in accordance with his statement of the 6th May last, that carriages would be allowed to drive from the end of James-street through the end of S. James's-park, and out by Storey's-gate, he was prepared to sanction the opening of that thoroughfare, or whether the intention of so doing had been abandoned; and if so, upon what grounds.—Mr. Ayrton said the roadway along the Victoria Embankment would be opened on Wednesday, and when Government saw what effect that would have upon the Abingdon-street traffic they would see how they could otherwise improve the approaches to the house.

The Subway.—Mr. Ayrton, in reply to a duestion put to him by Mr. H. Edwards, said that as the Board of Works had sold all the ground on the east side of Westminster-bridge, the Government was unable to make the subway between the Embankment and Metropolitan District Railway, as had been originally proposed. Under these circumstances the Metropolitan Board, at their own expense, were constructing the curved subway, communicating with the steam packet wharf.

Building Intelligence.

CHURCHES AND CHAPELS.

Albury.—The parish church of S. Peter and S. Paul, Albury, Surrey, was re-opened on Thursday week by the Bishop of Winchester, after having undergone extensive alterations, and as, in the extension of the chancel, the altar was moved, a re-consecration was necessary. The arched head of the west door has been filled in with herring-bone brickwork, the nave has been furnished with open seats of red pine, and the vestibule panelled with the same sort of wood. The passages of nave and aisles are paved with Maw's encaustic tiles. The new pulpit has been executed by Mr. Earp, from a design by the architect, and consists of a red Mansfield base, with Caen stone superstructure, in which are alabaster panels filled with marbles of various colours. The whole is surmounted by a richly-carved moulding. The chancel, which is separated from the nave by an oak screen, is ascended by three steps, and filled with oak benches from the choir, the flooring being of encaustic tiles. The reredos is by Salviati, of Venice, and is the gift of Earl Percy. The organ is by Gray and Davison. The five windows in the chancel are the work of Mrs. Drummond, and some stained windows in the nave are by Mr. A. Gibbs, of Bedford-square. A striking corona, the work of Messrs. Hardman, has been presented by the Rev. L. O. Bigg. The church is heated with hot-water apparatus by Mr. Smith, of Bramley. The roof is covered with green and chocolate Bangor slates. The iron crosses on the transepts and of the nave are the work of Mr. Poulter, of Albury. The architect is Mr. A. W. Blomfield; Mr. Reavell was the clerk of the works: and Mr. B. Inkpen, of Abinger, the contractor.

Beaumaris.—A new English Presbyterian chapel was opened at Beaumaris on Sunday week. The chapel was designed and carried out under the superintendence of Mr. R. G. Thomas, architect, of Menai-bridge, and the style of architecture adopted is Early English. The walls are built of rubble work, lined internally with bricks, and plastered, and faced on the outside with Penmaenmawr stone, all the dressings being of Bath stone, from Messrs. Randell, Saunders, and Co.'s quarry. The cast iron work was supplied by Messrs. W. Macfarlane and Co., of Glasgow. The contractor for the whole of the works was Mr. John Pritchard, of Gaerwen. The cost of the building was under £900.

Chiddingfold.—The parish church of Chiddingfold, Surrey, was re-opened by the Bishop of Winchester on Tuesday last, after undergoing very extensive alterations and additions. The church has undergone thorough restoration; the tower has been raised 12ft.; a new north aisle has been added; and the chancel aisle has been rebuilt. The roof has been opened out, and the old oak beams stained. The roof in the new aisle is of fir. The new reredos is of light and dark alabaster, with canopies and green marble shafts. Under the central canopy is a white alabaster cross, and on each side are bands of *fleur-de-lis* tiles between strings of stone. The altar rail is of oak, arcaded, and the old piscina and aumbry are retained. The church is paved throughout with Minton's tiles. The sittings are of oak, as is also the pulpit. In the west end a new tower arch has been constructed. The tower, which has been considerably repaired as well as raised in height, was found to have been added subsequently to the erection of the nave. The east window has been filled with stained glass by Messrs. Warrington, of London. The work of restoration and enlargement has been carried out by Mr. Harris, builder, of Woking, from plans by and under the superintendence of Mr. Woodyer, architect.

Dalry, N.B.—The heritors of this parish, having some time ago resolved to build a new parish church, appointed a committeee to visit most of the new churches in and around Glrsgow. After careful examination, they recommended that their new church should be designed after the model of Eastwood Parish Church, and that the architect of that church, Mr. David Thomson, I.A., Glasgow, should be employed to build the new one. Accordingly, Mr. Thomson attended a meeting of the heritors in the Town Hall on the 1st inst., and received their instructions to prepare plans for a new church similar to that at Eastwood, and seated for 1100. The new church will be in the Gothic style of architecture, cruciform on plan, having galleries in the three arms of the cross, with open-timbered roof, and having a handsome tower and spire over the entrance. It is to be built on the site of the present church, which is to be removed.

Frome.—On Thursday week the foundation stone of a new Wesleyan chapel was laid at Beckington, near Frome. The chapel will be Gothic in style, and will be erected from a design by Mr. R. T. Williams, architect, of Frome. Messrs. Yeoman and Hodder, of Frome, are the contractors.

Heigham.—The foundation stone of the new church of S. Philip, Heigham, near Norwich, was laid on Wednesday week. The church will accommodate 800 persons, and the style adopted by the architect (Mr. E. Power, A.R.I.B.A., of Walbrook-buildings, London) is thirteenth century French Gothic. The building will be faced with flint, with Bath stone dressings, and will comprise nave, chancel, north and south aisles, and tower at the north-west end. The roof will be open-timbered, and the passages of the nave and aisles will be paved with Worcestershire tiles. Mr. J. Nelson, of Necton, is the contractor, Mr. Childs, of Norwich, the sub-contracter for the masonry, and Mr. Cooper, of London, the clerk of the works. The contract is divided into three parts—one for building the church with the tower as far as the roof, £3,262; the second for the remainder of the tower, £757; and the third for the addition of a spire, £568.

Maidenhead.—Mr. G. R. Clarke writes us that this church has cost nearer £7000 than £3500 (as stated in our number for July 1), and that it was built under three contracts, of which Mr. Griffiths was first contractor.

Roath.—On Sunday last the new parish church of Roath, South Wales, was opened for Divine service. The style is Early Geometrical. The plan is cruciform, consisting of chancel, nave, and north and south transept. The materials used are Newbridge stone in thin courses, with Bath stone dressings. The roof is of small green Bangor slates. The cost is about £6000. Mr. John Prichard, of Llandaff, is the architect, and Mr. T. Williams, of Llandaff-road, the builder.

Salisbury Diocesan Church Building Association.—At a meeting of the Committee of this association on Thursday week, grants were made as follows:—£70 towards the erection of a chancel, organ chamber, and vestry, at Christ Church, Warminster; £25 towards the restoration of the church at Iwerne Minster; £30 towards the restoration of the church at Silton, Dorset; £70 and £15 towards the restoration of the parish churches of Turnworth and Buckland Newton; and £200 towards the erection of a new district church at Portland. The plans of this latter church have been prepared by Captain Du Cane, R.E., Inspector General of Prisons, and have been approved by the diocesan architect. This church is intended to hold 300 persons, and will be built of Portland stone. It will consist of nave and transept, with a circular apse. The total cost is estimated at £2680.

Seaham Harbour.—A new (Roman) Catholic church has been opened at Seaham Harbour. It consists of an apse 10ft. deep by 21ft. wide, a nave 68ft. by 21ft., and aisles extending from the apse one-half of the length of the nave, and 15ft. wide. The architect is Mr. John Seed, of Monkwearmouth.

Sheffield.—The corner stone of a new Wesleyan Methodist chapel was laid in Rawmarsh, Sheffield, on Monday afternoon, by Mr. J. Maxfield, C.E. The new chapel is to be built on the site of the old one, and will be 62ft. long by 41ft. wide. The basement will be used as a schoolroom, and the chapel will accommodate about 600 persons. The estimated cost of the building is £1400. The architect is Mr. John Hutchinson, of Rotherham, the contractor being Mr. Thomas Walker of Doncaster.

Streatham.—On Saturday week S. Peter's Church, Streatham, was consecrated by the Lord Bishop of the diocese. The style of the church is Early Decorated, and it is built of brick, relieved with stone, and consists of chancel, chancel-aisle, portion of nave, three bays in length, with temporary wall at the west end. The chancel is lofty, being the same height as the nave, and the altar is well raised. The roof is open-timbered, and covered with tiles. The passages are laid with Minton's tiles and stone in simple patterns, the chancel being paved with rich encaustic tiling. All the fittings are of oak, those in the chancel being inlaid with walnut wood. The ceiling of the sanctuary is enriched with colour decoration, executed by Messrs. Heaton, Butler and Bayne; the lower panels are filled with representations of the Apostles, and those above them with patterns in primitive colours. The whole length of the church has been divided into panels above the arcade and the stringcourse in the chancel; it is intended to fill the whole of these with frescoes, but at present two only, those in the sanctuary, have been completed; they represent the Nativity and the Descent from the Cross. The reredos will be of freestone and mosaic, representing the Resurrection and attendant incidents. The expenditure at the present time has been about £5000, and another £2000 will be required to complete the church, exclusive of the tower. Mr. R. W. Drew, of Storey's-gate, is the architect.

The Mayor's Chapel, Bristol.—This exquisite specimen of Gothic art, in its richest and chastest form, has just undergone several important alterations. Mr. Butterfield, of London, was the architect. The chief alteration consists in the removal of the organ from the gallery over the porch to a new gallery in the transept beneath the tower. The other alterations recently carried out consist in the removal of the old chancel screens, and the erection of a new altar-piece, with raised marble steps and rails of mediæval metal work.

Buildings.

Bolton. The late Mr. Stephen Blair, formerly M.P. for Bolton, has left a sum of £20,000 to build and furnish a hospital for sick persons in Bolton, on condition that a site for the same within the area of the Bolton Union be provided within a period of three years, inasmuch as he could not legally leave money to purchase land for the site. Mr. Blair has also left £10,000 to be invested as an endowment to the charity, which is to be called the "Blair Hospital."

Cheshunt.—The foundation stone of additional buildings in connection with the Countess of Huntingdon's College at Cheshunt was laid on the 30th ult., by Lord Shaftesbury. The buildings thus commenced (and which form the first portion of work contemplated by the Committee) will consist of a rectangular block 121ft. long, 26ft. deep, and three stories high, having slightly projecting wings at each end. On the ground floor will be two lecture rooms and six students' rooms. The first and second floors will each contain ten students' rooms. At the west end of this range of building will be the tower, containing, on the ground floor, the main entrance, and, above, two students' rooms. The students rooms will average 16ft. by 11ft. The work will be executed in brick, with Bath stone strings, arches, plinths, and other enrichments. The architects are Messrs. Lander and Bedells, of John-street, Bedford-row, and Messrs. Dove Bros., of Studd-street, Islington, are the contractors. The total cost will be £8000.

Halifax.—It was decided on Friday last, at a special meeting of the governors of the Halifax infirmary, that a new building in which to carry on the operations of the charity should be erected on a fresh site, towards the cost of which Sir F. Crossley has promised £10,000. The spot selected for the new building is on the west side of the People's Park, and the expenditure on the land and the new building will be about £16,000.

Percy Main.—The new schools at Percy Main, Northumberland, were formally opened last week. The plans were designed by Messrs. Green and Gibson, Newcastle, the edifice being in accordance with the Italian style of architecture. The estimated cost was £1050.

Spennymoor.—A new covered market for Spennymoor was opened on Wednesday week. The dimensions are—total length, 160ft.; width, 37ft. 6in. There are 14 shops within the building, and there is a large open space in the centre, affording room for two rows of stalls. The market has been erected from plans by Mr. Byers, surveyor to the Local Board.

TO CORRESPONDENTS.

Correspondence.

VICTORIA STONE.

(To the Editor of The Building News.)

Sir,—The letter from the Manager of the Victoria Stone Co., which appeared in your last number, though professing to reply to my former letter, is no reply at all. If the Manager will read my letter he will see that I say nothing whatever for or against the quality of the Victoria Stone—mine was a question of cost, and cost only. Speaking of the paving laid by them in the Poultry, the prophecy alleged to me is simply untrue; the paving had been laid some time before my attention was called to it. The thickness and cost of the Yorkshire flagging laid there at the same time, though by no means a picked specimen, are well known; let the Manager tell us the cost and thickness of the paving laid by him in the Poultry, and I am willing to abide the result. Moreover, regarding his challenge No. 1, I am quite willing that the paving laid in the Poultry, and the York laid at the same time, shall decide the question as to which is most durable, after they have borne the test of time and continual wear. I have no fear as to which will prove the best. I can say nothing about his challenge No. 2, as I have no knowledge how his beam is constructed; but if he will take a piece of his flagging, I will take a piece of flagging, and instead of his flag carrying double the weight mine will carry, mine shall carry twice the weight his ill carry.—I am yours, &c.,

Samuel Trickett.

July 7, 1870.

THE PRESERVATION OF ANTIQUITIES.

Sir,—Within the week, a very interesting crypt has been destroyed in the City, which was uncovered a few months since in Aldgate, just behind and below the pump. The pump has replaced a cross. The crypt belonged to S. Michael's Church, which had been removed before Stow's time. The roadway required widening, so the arches of the crypt are now destroyed, and the cavity filled in with rubbish.

This was public property, so a committee of conservation would have been free to note it, and take steps for its preservation; but Stonehenge is private property, it belongs to the Antrobus family, who own Amesbury Park; and although I think it post-Roman in date, I cordially agree with you in desiring to see it preserved alike from accidental and from wanton destruction.

With this view, when on the spot last Autumn, I expressed a desire to see it protected by a fence, but was told that such enclosing would detract from its wild, solitary grandeur. I walked over there alone, one evening after dark, and while there saw the moon rise, just about full; no sound, no object or person visible, but these massy megaliths, which cast a long shadow on the sward, and assumed various fantastic shapes in the pale moonlight. There they stand, at the mercy of all intruders.—I am yours, &c.,

A. H. Gent.

July 8, 1870.

"THE PERPLEXITIES OF BUILDING."

Sir,—Upon the high authority of a local journal, you have thought it well to insert a paragraph in your last week's number, in which the new Islington Workhouse at Upper Holloway is held forth as a very fitting illustration of a most unhappy subject. Allow me, as the architect, to express no less my surprise than my regret at the appearance of the paragraph, the assertions therein contained doing no good to the cause they are intended to serve, and, furthermore, only misleading the public, evidencing as they do the most imperfect acquaintance with the subject. Much that is written is nonsense. Whether or no the new Islington Workhouse will prove an "unenviable handful" for the guardians, time will best show. Further comment is unnecessary.—I am, yours. &c.,

R. H. Burden,

307, Oxford-street, W., 7th July, 1870.

THE DOME OF ST. PETER'S.

Sir,—In your issue of 1st July, a paragraph is reproduced—quoted from the *Athenæum*—as to the bending of the axis of St. Peter's at Rome, running thus:—"But although thousands have gazed at that wonderful church, it was *only the other day that a French traveller* observed that the middle point of the dome and that of the portico do not coincide. The difference between them is nearly 5ft.," &c.

The "Encyclopædia of Architecture," by J. Gwilt Edition 1842, No. 142, discusses the work of Carlo Maderno, thus:—"The bungling of Carlo Maderno is much to be regretted. The arches he added to the nave are smaller in dimensions than those which had been brought up immediately adjoining the piers of the cupola; and, what is still more unpardonable, the part which he added to the nave is not in a continued line with the other work, but inclines considerably; *in other words, the church is not straight, and that to such an extent as to strike every educated eye.*"

In Chambers's "Treatise of Civil Architecture," edited by J. Gwilt, 1825, the editor takes occasion to remark, p. 325:—

"The foot which he (Carlo Maderno) added to the cross was executed in the most disgraceful manner; instead of continuing it in a direction parallel to the central line from west to east, he laid his foundations so inaccurately that the adjunct swerves 3ft. and nearly 2in. northward from the proper direction, and to coax the blunder, he made the nave wider at the eastern than at the western end. I ascertained this deviation by boring a line along the plinths on the pavement, and can therefore vouch for the accuracy of the dimension stated."

It should be borne in mind that the great entrance at St. Peter's is at the east end, and the altar at the west. Has not our French traveller led the *Athenæum* strangely astray?—"The difference must be due either to an original defect in construction, or to *subsequent inclination of the axis of the building*" (*!*) S. F. C.

PAVING STONES.

Sir,—To the letter of a York stone merchant in The Building News of last week, in which the writer tries to lessen the advantages and superiority of the patent Victoria stone over York paving in raising the difficulty of removing the pavement for water, gas, &c., pipes, he forgets to see that it is also a difficulty with the York, or, in fact, with any kind of pavement. A pavement cannot be good and last long if not properly laid and bedded, and when so laid and bedded it ought not to be removed at all; and consequently a choice and hard stone should be laid, and not, as is too often the case, a cheap and comparatively soft York stone. I have just had upwards of 3000ft. of the patent Victoria stone pavement laid in front of some houses that I am erecting, and have laid underneath the pavement 4″ glazed stoneware pipes, in which I can at any time put in or take out gas, water, &c., pipes. This will, of course, obviate the removal of the pavement. The same process should be applied to York or other paving. If this were done, York paving could then be laid and bedded in mortar, which would prevent it rotting as soon as it now does. But to be so laid York stone would have to be selected and properly worked before it would make such a good pavement as can be obtained with the patent Victoria stone—that is to say, half of the York pavement in London would have to be rejected, and the stone merchant will perhaps tell us at what per cent. the York stone would then cost above the patent Victoria stone to be of equal strength and finish.—I am, Sir, &c.

ALEX. VACHEROT, Architect.

DESTRUCTION OF WORKS OF ART BY THE POLICE.

SIR,—Either in consequence of my not having been sufficiently heard, or from the necessary curtailment of your report in last Friday's paper, the remarks I made with reference to the Evans case are not quite correctly reported. I said, "That I had not happened to have heard of the case Mr. Perry was speaking of before the evening of the 28th, at the Academy *soirée*, when some of the students were complaining of the injustice that had been done, and informed me that a petition to Mr. Bruce was being signed by Academicians and others, with a view of mitigating the penalty of £50, and the long imprisonment to which Evans had been sentenced; that I had occasionally purchased, for the purposes of study, photographs of Mr. Evans, and had never seen any description of photograph or drawing in his shop of an indecent character."

I shall feel obliged if you will kindly insert this modification of your report.—I am, Sir, &c.

R. PHENE SPIER

[Mr. Perry and the other gentlemen who took part in the discussion, as reported in our last number, page 21, are mistaken. We have made inquiries about the matter, and find that besides the works of art referred to, Evans had in his possession photographs and prints of the most reprehensible character, and that he richly deserves the condemnation passed upon him. In our opinion no class of men more thoroughly deserve severe chastisement than those who, for dirty gain, minister to the prurient appetites of the depraved.—ED .B. N.]

BUILDERS' DRAWING PLANS.

SIR,—Will you allow me, through your valuable journal, to complain against "builders' drawing plans?" I am certain that unless something is done our profession will soon become a very poor one. I know of several persons in this town acting as both architect and builder, and yet many architects allow them to come to their offices to tender for work, when at the same time they are copying the designs, and afterwards carry them out. Surely a license, the same as to auctioneers, could be granted to architects only, and so protect them against this unfair practice. For my part, if I know of builders doing so, I don't on any consideration allow them to tender for my work. Trusting that our leading members of the profession will at once take the matter up, and have something done at once, I am, Sir, &c.,

Hull, July 12th, 1870 AN OLD SUBSCRIBER.

COMPETITION DRAWINGS, SOUTH KENSINGTON.

SIR,—Will you kindly find space in your paper to state that I have not seen Mr. Westwood's work, spoken of in the BUILDING NEWS of the first of July, and therefore your conjecture is wrong as regards my designs.—I am, Sir, yours &c.,

JOHN FROST.

Coventry.

QUESTIONS.

[1895.]—RAISING WATER.—A gentleman's house is situated on rising ground, and its only "potable" water supply is from a well, about 150 yards distant, and 50ft. below the level of the house, and the question is, how to get it up without carrying it as at present. Some years ago an hydraulic ram was tried, but proved (as might have been expected) an utter failure, from want of sufficient water. It is now proposed to put an ordinary force pump into the well, and pump the water through the ¾" lead pipe laid in for the ram. Would any reader kindly say whether he has had any experience of such a thing, and if he thinks it will work, or suggest, if possible, a more efficient method of attaining the same object? Cost is not specially a consideration.—D. H.

[1896.]—STETTIN WHITE WOOD.—Will any of your readers kindly say what sort of timber Stettin white wood is for bearing purposes, sawn into beams, &c.; I mean the logs which come in long lengths, and about 12 to 17in. quarter girth?—F. G. H.

[1897.]—GIRDERS.—I should be greatly obliged if any of your readers would define what is a "warren" girder, and why it is so called? I see it mentioned frequently, and partly described in books, but have never seen an explanation of the term always attached to it.—JUVENIS.

[1898.]—RECLAMATION BANKS.—In some sea banks I am making up in the county of Essex, I am required to make the outer slope three to one, while the inner is only one and a half to one. Is this usual, or is it only a fancy of the engineer? Any of your correspondeats who have had experience in the matter would render me a great favour by mentioning it in your next.—CONTRACTOR.

[1899.]—BOOKS ON HARBOURS.—As I shall shortly be sent down on some large harbour works, I should like to know something of the theory of the subject. Is there any good treatise on them, and by whom, and where obtainable? A reply will oblige.—APPRENTICE.

REPLIES.

[1883.]—STRENGTH OF GIRDERS.—As no one has answered your correspondent, I may perhaps inform him that it is always considered the safest practice to make no allowance for the fixing of the ends of a beam. It is not by any means absolutely decided, even upon theoretical principles alone, what is the exact increase of strength given to a beam fixed at either, or at both ends, instead of being merely supported, and the assumption that is made of the increase depends upon the fixing being *perfectly* rigid and immovable, conditions which never are fulfilled in actual practice. I do not quite comprehend the latter question, as the addition of the iron plate to the timber must necessarily increase its strength under any conditions. Flitch beams are not, in my opinion, desirable pieces of construction. I should always prefer using a small rolled iron joist of the proper sectional area.—AN OLD HAND.

[1890.]—BEAMS, COLUMNS, GIRDERS.—You cannot have a better book than the little volame recently published by Lockwood and Co; it is "The Science of Building, an Elementary Treatise on the Principles of Construction," by E: Wyndham Tarn, M.A., London. The whole subject is treated concisely and practically.—STUDENT.

[1893.]—ARCHITECTS IN AMERICA.—I quite coincide with the draughtsman who signs himself "One too Many Here," and think there are a great many too many draughtsmen and architectural assistants in this country, and I for another would like to know if there is any method by which one could get an introduction to an assistancy in America, or any other place; or, if agreeable, would not object to join him in taking a trip across "the big herring pond," as the Yankees term it, to see for oneself.—T. T. M. H.

[1894.]—LEAD ROOFING.—Let "L. R." renew his lead with zinc next time; the latter metal will safely withstand many corroding influences which destroy the former.—T. N. S.

◆

STAINED GLASS.

CHIDDINGFOLD.—The east window of Chiddingfold Church, Surrey, has just been filled with stained glass by Messrs. Warrington, of London. The window is in three compartments, each compartment having two subjects. The central and principal subject is the Crucifixion, and below this is S. Paul shaking off the viper. On the right are Christ appearing to Mary Magdalene, and Christ walking on the Sea. On the left are the Nativity, and Christ stilling the storm. The whole are surmounted by canopies in the Decorated style of the fourteenth century. At the apex of the window are three small figures, representative of the Annunciation. One of the chief characteristics of the window in said to consist in the absence in the figures and composition of that mediæval conventionality wihch, carried beyond reasonable limits, becomes sheer caricature.

◆

WATER SUPPLY AND SANITARY MATTERS.

THE SEWAGE QUESTION.—On Saturday Sir John Thwaites and about 20 members of the Metropolitan Board of Works, with Mr. Keats, the consulting chemist of the Board, paid an official visit to the Leamington Sewage Works, for the purpose of inspecting the "A B C" system of treating town sewage. Sir John and the deputation were conducted through the sewage works by Messrs. Sillars, the resident directors of the Native Guano Company, and were accompanied by Mr. S. Urwick Jones, the chairman of the Leamington Local Board. The mode in which the "A B C" compound—animal charcoal, clay, and blood—is mixed with the sewage was explained, the effect which it has on the suspended matter in the sewage exhibited, and samples of the effluent water as it flowed into the river, after passing through subsiding canals and a large sand and charcoal filter, were shown to the deputation. Specimens of the native guano extracted from the sewage were also exhibited, and particulars were given of its fertilising effects when applied to different crops. Messrs. Sillar (in reply to a question from Sir John Thwaites), on behalf of the Native Guano Company, stated that they should be happy to allow any experienced chemist to have the supervision of the works for a fixed period, so as to thoroughly test the system on behalf of the Board. Sir John intimated that in all probability this offer to subject the system and works to an independent and rigorous test would be accepted by the Board at an early date.

CAMBRIDGE.—Three engineers—viz., Messrs. Rogers, Field, and Charles Cubitt, have been in Cambridge during the past week, and, aided by Mr. G. W. Stephenson, C.E., the town surveyor, and Mr. R. R. Rowe, the late town surveyor, have been engaged (on behalf of the Sewage Committee of the British Association) in investigations as to the sewerage of the town.

COATHAM.—The extension of the mains of the Stockton and Middlesbrough Water Works Company from Eston Junction to Coatham was completed on the 27th ult. The cost has been £5000.

UTILISATION OF SEWAGE.—The two bills for utilising the sewage of the towns of Blackburn, in Lancashire, with a population of 80,000, and of Reading, in Berkshire, of 30,000, which have been introduced by their respective Corporations, have been passed by Committees of the House of Lords. The bills empower the Corporations to purchase large tracts of land, on which to utilise the sewage by irrigation, and were keenly opposed in the Commons as well as fn the Lords. A large number of witnesses appeared against them, but the evidence in favour of the disposal of sewage in the manner proposed was deemed conclusive.

HATFIELD.—The new sewerage works at Hatfield, which have been carried out in consequence of the passing of the Lea Conservancy Act, were publicly opened on Monday week. The sewage is utilised on land at Billett Common, whither it flows by gravitation. The work has been carried out under the direction of Mr. T. W. Grindle, engineer to the Corporation of Hertford.

HULL.—The Waterworks' Committee of the Hull Corporation have been discussing the desirability of forthwith carrying out a scheme by Mr. Dale for getting an additional two million gallons of water at Springhead. It is estimated that this could be done at a moderate cost. Mr. Dale states that he has such confidence in the resources of Springhead that he believes 15,000,000 or 20,000,000 gallons could be obtained daily from the present sites, without having to obtain an Act of Parliament to carry out fresh works. Other proposals were submitted to the Committee, but no decision was come to.

SHEFFIELD MAIN DRAINAGE.—At the last meeting of the Sheffield Town Council, the Borough Surveyor reported that during the past month 274 lineal yards of the main drain had been completed, making the total length now completed 4 miles 1293 yards.

ASHFORD.—The new water company has been for some time carrying out works for the purpose of supplying the town with water. Mr. Hoad, of Worthing, engineer, has sunk two wells at Henwood, which have been tested and found to yield upwards of 240,000 gallons per day of most excellent water. Mr. Hoad is connecting these wells with the waterworks by means of a syphon apparatus.

◆

LAND AND BUILDING SOCIETIES.

THE PERPETUAL INVESTMENT AND BUILDING SOCIETY.—The nineteenth annual meeting of this society was held on Wednesday week at Radley's Hotel, New Bridge-street; Mr. R. J. Millar in the chair. The report stated that in consequence of the depressed condition of house property, the directors had deemed it wise to decline much of the loan business which had been offered to them. One thousand seven hundred and four new shares had been issued during the year. The total amount now invested with the society in shares is £264,110 1s. 11d., inclusive of interest and bonuses. A bonus of two per cent. is apportioned amongst the holders of subscription shares; £26,920 2s. 7d. has been advanced upon mortgages; and £7,720 10s. to shareholders upon the security of their shares. The balance now remaining upon mortgage is £202,268 11s. 10d, The cash statement shows that the income of the society for the year was £148,152 16s. 10d. The report was adopted by the meeting, several questions were asked and answered to the cordial satisfaction of the shareholders, the retiring directors and auditors were re-elected, and votes of thanks to the directors, auditors, secretary, officials, solicitor, &c., brought the meeting to a close.

THE KING'S CROSS INDUSTRIAL DWELLINGS' COMPANY.—This company has just been formed, Dr. Lankester, the coroner, being its chairman. The proposed capital is £46,000, in 23,000 shares of £2 each. The association is formed for the purpose of providing healthy and comfortable house accommodation for the industrial classes, at a moderate rental, in a densely-populated district, where, owing to the considerable destruction of property at Somers'-town, Agar-town, and the adjoining neighbourhood, there exists a great want of dwellings of that character. The company has secured as a site for the proposed buildings the lease (for 88 years) of the King's Cross market, in the immediate vicinity of the Midland and Great Northern Railway Termini and the Imperial Gas Works, and a contract has been entered into with the vendor (Mr. J. T. Robinson) to erect 192 dwellings, according to the plans of the company's architect. These buildings will possess the advantages of each tenement being complete in itself, including every necessary sanitary arrangement.

ROCHESTER BUILDING SOCIETY.—The annual meeting of the City of Rochester Building Society was held on Monday last, when the report presented was very satisfactory. A dividend of 6½ per cent. was declared.

◆

LEGAL.

LIABILITY TO FENCE LAND.—In the Bath County Court, recently, in the case of Paget *v.* Somerset Coal Company, his Honour (Judge Caillard) gave judgment. The plaintiff sued defendants for the value of a sheep which had wandered from the plaintiff's land, and which land had formerly been part of the same field. It was admitted by the plaintiff's counsel that there was nothing in the company's acts or deeds of conveyance to render the company liable to maintain a fence between the plaintiff's land and their quarry, but it was contended that as defendants had caused the danger by their quarrying it was their duty to fence off the land. In support of this view, Grovcott *v.* Williams, 32 *Law Journal* Reports Q. B., 237, aud other cases, were cited. His Honour held that as defendants' land was adjoining the plaintiff's, and not a mere shaft sunk in the plaintiff's land, there was no obligation to maintain the fence, and he therefore gave judgment for defendants.

◆

THE VICTORIA EMBANKMENT.—On Wednesday the Victoria Embankment was opened by the Prince of Wales and the Princess Louise, amid various manifestations of public interest in the completion of that great work. Their Royal Highnesses, at the head of a procession, entered upon the Embankment from Westminster-bridge, and having paused midway to receive an address, passed on to Blackfriars, when the Prince declared the work open. The barriers were then removed, and the public were admitted to the Embankment.

Our Office Table.

Bradford Church Literary Institute.—We have previously announced that designs for the proposed new building in North-parade, for the purposes of the Church Literary Institute, had been submitted by Messrs. Milnes and France, Mr. W. Gay, Mr. Stead Ellis, and Messrs. Andrews, Son, and Pepper, architects, all of Bradford. The designs, which are in the Gothic style, have been on view in the library of the Institute, and were generally admired. On Friday last the committee charged with the duty of selection had a meeting, which lasted over three hours. The several plans were carefully gone into and their respective merits considered, the result being that Messrs. Andrew, Son, and Pepper's design was selected for the proposed building. The firm submitted an alternative plan, showing shops on the ground floor, but the idea of having shops was abandoned, and some other modifications were suggested—for instance, the enlargement of the lecture hall, so that it will hold from 600 to 700 persons, instead of 500, as shown on the plan. The elevation fronting North-parade is handsome, and sufficiently imposing to denote a public edifice. Although the front is called Gothic, it is freely treated, and has little ecclesiastical character. The cost is estimated at £5000.

The New Law Courts and the Serpentine.—Mr. G. S. Pedler suggests in the *Times* that as the *débris* from seven acres of old houses, and the excavations to a depth of something like 20ft. for the new site in Carey-street, will give some trouble to find a place in which to shoot the rubbish, it should be carted to Hyde Park to concrete the bed of the Serpentine, thus raising the bottom, and making a good job of it, once for all, and render it a beautiful and healthy sheet of pure water for the enjoyment of every one.

New Landing Pier, Douglas, Isle of Man.—This magnificent structure, the cost of which has been nearly £50,000, having been completed to a certain extent, has been opened for the landing and embarkation of passengers. The pier, which is 1080ft. long, 50ft. wide, and has 20ft. depth of water at low water spring tides, is constructed of concrete blocks, from designs by Mr. Coode, C.E., and has been carried out under the superintendence of Mr. Powell, C.E. The result of the formation of this pier is that Douglas is no longer a tidal harbour, steamers being able to come and go at all times of the tide.

Parisian Cemeteries.—Great anxiety has been felt with respect to the condition of the Parisian cemeteries. Montmartre was declared to be in such a condition that its closing was imperatively called for, while Pere la Chaise and Mont Parnasse ought not to remain open for more than two years. Instead of yielding to the general desire which has been expressed for the establishment of a new cemetery, the municipal authorities of Paris have proposed to invest the sum of 7,500,000f. in the enlargment of the present cemeteries.

Annual Dinner.—The artisans of the firm of Messrs. Pitman and Cuthbertson (late Hayward and Pitman), decorators, 30, Newgate-street, had their 12th annual dinner on Saturday last. They left Shoreditch station about 11 o'clock for Rye House, where they enjoyed the beauty of the gardens and grounds. At 2 o'clock a capital dinner was provided in the Oak-room on the lawn by the proprietor, Mr. Teale, enlivened by excellent music. The principals of the firm were present, Mr. Pitman presiding. After dinner the sports and pastimes commenced, and afforded the greatest amusement until 7 o'clock, when the party assembled to tea. The whole arrangements were under the superintendence of Mr. Garey and Mr. Roy, the two foremen of the firm, who received the heartiest praise. In the evening all returned to town delighted with the pleasures of the day.

The Ailantus as a Timber Tree.—Both in France and America this tree is said to be gaining ground in the estimation of practical men. Experiments made in France (says the *American Agriculturist*) show the wood to have less density than that of the oak, and greater than that of the elm, while it is superior to either of the two in elasticity and tenacity. Ailantus planks have been exposed to the weather for 27 years, without shelter or paint, and the wood is still perfectly preserved. The wood is useful for agricultural implements, and it neither warps nor cracks. It saws readily, and afterwards acquires great hardness under exposure to the air. The ailantus grows so freely in America that it ought not to be a difficult matter to ascertain whether its timber is as serviceable there as it is said to be in France.

The Westminster Subway.—A letter from Mr. E. M. Barry has appeared in the *Times* with reference to Mr. Ayrton's recent statement in the House of Commons that Mr. Barry had failed to effect the necessary arrangements with the Metropolitan Board of Works and the railway for making the subway to the steamboat pier. Mr. Barry leaves it to Mr. Ayrton to reconcile his assertion with the assurances given by Ministers in the House of Commons to Mr. Cowper-Temple that his service had not been dispensed with in respect of unfinished works; but he asks to be permitted to say that there was no failure of negotiations while they were in his hands. On the contrary, before Mr. Ayrton interrupted them, he had not only agreed with Mr. Bazalgette on the subject, but had actually modified the works of the Bridge-street Subway, to enable the junction agreed on to be made. The only difficulty at that time was the reluctance of the Office of Works to allow the public the use of the subway. The Metropolitan Board insisted on this concession, and it has now been made. Mr. Barry, according to his own statement, was not instructed to negotiate with the railway company except once, when Mr. Ayrton wished him to press upon them a suggestion of his on another matter, which they declined to entertain, and which was in consequence abandoned. Mr. Barry observes that as the work would, in any case, have been carried out by the Metropolitan Board, he had no personal advantage to gain from his advice being followed, but he regrets to see a public improvement of importance marred in its execution.

Improvements at Buxton.—The plans of the walks and proposed erections for the new gardens at Buxton, to be carried out under the auspices of the Buxton Improvement Company, have been submitted to the directors by Mr. Milner, of Norwood, the landscape gardener engaged to carry out the works, and they are now on view at the Court-house.

The Case of Henry Evans.—The *Globe* is at a loss to understand the passage in the proceedings of the Architectural Association with regard to the case of Henry Evans, as reported in last week's Building News. "It is now," says our contemporary, "three months since Evans was convicted; how comes it to pass that if the case were as gross as it is described by the Architectural Association, the gentlemen who are now boiling over with indignation have not moved in the matter earlier? Mr. J. T. Perry and Mr. Spiers, at least, would seem to have known all about the matter from the first. This question requires an answer, and until those who would appear to have been accessories to the miscarriage of justice explain their silence we must hold them responsible for what has occurred, even more directly than the police."

Public Works in the Isle of Man.—The Legislature of the Isle of Man was last week engaged in considering the various public improvements that have been recently proposed. The Court voted the sum of £14,200 for the erection and fitting up of a building at Douglas for the Law Courts and House of Assembly; £28,000 for a pier at Ramsey; and £6340 for improvements at Castletown Harbour. The pier at Ramsey will be 2100ft. long; 2000ft. of this will be an iron viaduct, going out to about 13ft. at low water spring tides, and there will be a solid head 100ft long for steamers to lie against. When this pier is constructed, passengers will be able to land at Ramsey at all states of the tide.

Is Sewage Irrigation Injurious to Health.—An outbreak of scarlatina having recently occurred at Beddington Corner, in the Croydon Union, brought down upon the guardians the authorities of the Medical Department of the Privy Council. In consequence of their instructions, Dr. Cressy, the medical officer, was instructed to visit the district, and report thereupon. His opinion—formed apparently on the slightest possible grounds—was that the district suffered from its propinquity to the Croydon sewage grounds. The Local Board were communicated with, and Mr. Baldwin Latham was instructed to prepare a report on the subject, which is before us. From Mr. Latham's report it would appear that Dr. Cressy is unduly prejudiced against the sewage works, and the facts adduced by Mr. Latham bear out this view of the matter. The neglected sanitary condition of the district appears to be really responsible for the late outbreak, and prompt action should be taken by the guardians for its improvement. A hint to Dr. Cressy to be quite certain as to his facts in future, before fastening all the blame on his favourite *béte noir*, the sewage ground, would not be amiss.

Victoria Legal Friendly Society.—The annual meeting of the members of the Liverpool Victoria Legal Friendly Society, for the purpose of passing the accounts and other annual business, was held at Liverpool recently, Mr. Timothy Crowley, president, in the chair. The financial statement showed that there had been collected from the 28th May, 1869, to 27th May last, £43,852 19s. 5d., and there had been paid on 4181 insurance claims and grants during the same period, £18,804 17s. 2d.; on collectors' commission, £10,962 0s. 4d.; managers, agents, and collectors' salaries. £3258 13s. 6d.; officers, clerks', and auditors' salaries, £1034; committee and collectors' fees for transferring names of members, £537 8s. 2d½.; officers and others visiting country districts, and agency superintendents' salary and expenses, £446 4s. 10½d. The sum of £7424 5s. 0½d. had been saved during the year, and the total worth of the society on the 27th of May last was £26,945 16s. 8d.

Architectural Excursion.—Among the many steps which the Architectural Association has taken to encourage and assist the student in the preparation necessary to fit him for his profession as an architect, there has been added this year another which will afford very valuable aid to all those who are anxious to study the architecture of ancient buildings. Advantage has been taken of a very generous offer made some time ago by Edmund Sharpe, Esq., M.A., whose well-known works on English Architecture necessitates no further introduction for him, to take charge of a party of students for the purpose of studying and sketching in one of the many districts of England rich in Architectural remains. A plan has been organised for visiting Lincoln, Boston, Spalding, Sleaford, and the neighbourhood during the week commencing August 23rd. The advantages offered have found a ready response from members of the association, but it is felt that there are many connected with other societies in various parts of England by whom this opportunity would be valued; it has, therefore, been determined to invite other Architectural societies or students introduced by members of other societies to join the association on this occasion. Detailed particulars may be had on application to Mr. John S. Quilter, 9, Conduit-street, London, W., but generally the plan may be stated as follows:—On Monday, August 23rd., the members will assemble at Lincoln, and in the afternoon an address will be given in the Assembly-rooms, by Mr. Sharpe, in which he will direct attention to the principal objects to be noticed, and the best means of studying the buildings; after which a general survey will be made of the Cathedral. Tuesday will be spent in the Cathedral and other buildings in Lincoln. On Wednesday, an excursion will be made along a very interesting line of churches, lying between Lincoln and Grantham. On Thursday, another will be made to Sleaford and the neighbourhood. On Friday, after a visit to Boston, the party will proceed to Spalding, and returning visit a series of churches between the two towns. Saturday will be occupied by completing the sketches, comparing notes, and concluding the excursion. So valuable an opportunity for Architectural students, needs no recommendation, especially under so able a guide, and in order that every facility may be afforded to Architectural students, arrangements have been made to keep the expenses within the smallest limits.

Chips.

Mr. Goldie, the architect, is engaged in building a country-seat for Mr. W. G. Ward, of Northwood, at Totlands Bay, Isle of Wight.

A new bridge is to be erected over the Chilton water, at Wickhambrook, Suffolk, from a design by Mr. Salter, architect, of Sudbury. The cost will be £500.

Alfriston Church, Sussex, has lately been under repair. A new board ceiling has been placed under the bells by Mr. J. Weston, and the old solly beam has been removed and a new ornamental iron one has been placed in its stead by Mr. F. Woolgar.

THE BUILDING NEWS.

LONDON, FRIDAY, JULY 22, 1870.

THE DECORATIONS OF THE CENTRAL REFRESHMENT ROOM AT THE SOUTH KENSINGTON MUSEUM.

THE authorities of the South Kensington Museum deserve much credit for their indomitable perseverance. Tyros in art, they have resolved to attain excellence therein, and that singlehanded, as it were. They will be self-taught, and let no one take the credit of having been their teachers. The task is an arduous one, but it must be confessed undertaken under exceptionably favourable circumstances, in so far as they have John Bull's unlimited bank to draw upon. Annual grants that have amounted to sums so vast that they would stagger the practical mind of an Ayrton, were he to try and realise them in the aggregate, have subsidised this establishment. Thus failures are wiped out, and one ambitious effort after another can be experimented upon with ease. From the mental strain of endeavouring to produce the greatest effect at the least cost the Department is quite free. Doubtless it is pleasant work having thus Fortunatus to deal with, but we doubt whether it be so desirable after all. Artists seek to live in their works long after their own temporary existence, but to do so their art must be doubly refined—winnowed from all admixture of chaff—and there is nothing that so tends to restrain wilful fancy as a wholesome subjugation to the ordinary rules of life, and Necessity is not only the mother of Invention, but its best nurse and governess as well. The very first essential of high art is that every stroke and every touch should tell, and the slovenliness engendered by the feeling that an error may escape notice amid profusion is fatal to true art.

We have been led to these reflections by a careful consideration and comparison of the three new refreshment rooms at the South Kensington Museum. The largest and central one, as we are informed by the guide book, owes its decoration (as yet incomplete) chiefly to artists connected with the Department, whereas the others are indebted for theirs (also incomplete), to the firm of Messrs. Morris, Marshall and Faulkener, and to Mr. E. J. Poynter, A.R.A., respectively.

The first-named apartment has afforded a grand opportunity, and has received, evidently, the utmost thought and care, not only in its general design, but in its details, which have been executed in the Establishment or under its direction; but withal, though we hope not to be thought hypercritical, and wish to give due meed to its merits, which are great, it has the appearance rather of scholarly adaptation of recognised precedents, than of homogeneous design, and a modern art-manufacture effect in its details, rather than the loving handiwork or manipulation which is ever characteristic of the best work. It is sumptuous, but lacking in tone, by which we mean that quiet repose and harmony which alone is permanently satisfactory. Still it is bright and cheerful, and being devoted to the bar counter of the refreshment department, the frequenters of which do not stay long therein, and while there are not much given to contemplation of other than the creature comforts they have come for, we own that the apartment is practically suited to its purpose. It looks like one of the richly and gaily-adorned cafés of Paris, and its crockery walls are pleasant from their cleanliness and capacity for the retention of that quality so near to godliness.

By contrast, too, it enhances the very different character of the two adjoining apartments, and it is quite refreshing to look from its glitter and garishness into the quiet and inviting rooms on either side, where diners take their longer meal, and rest after their intellectual labours in the museum itself. To their decoration, however, we hope to return when we have finished with the one which at present occupies our attention. The room is lofty, well proportioned, and arranged in three bays in its length by semi-circular arches borne on pilasters on the entrance side, and columns coupled in the thickness of the wall on the opposite side. This arcade opens into a semi-circular bay, lighted by five windows, and this recessed space contains the bar counter. The floor, as are those generally in the museum, is of a quiet and warm-coloured pattern of tiling—red squares, with smaller black ones set diagonally at their intersections, and a border runs round the apartment of yellow, with a black fret ornament thereon. The walls, columns, and pilasters have white plinths, bases, and a chocolate-coloured dado above, which in the columns is enriched with yellow lines and white rosettes. This dado is surmounted by a band about a foot high, of white amorini upon a yellow ground, which are not, in our opinion, modelled or cast as they should be. This is but sham art, just as they are sham columns—a casing of crockery built up round a brick core. In what Mr. Ruskin would call the wall-veil, above the dado and band of pseudo-sculpture last described, are spaces left for two panels of painting of some description not yet executed; there will be one of these on either side of the doorway which occupies the centre of each end of the room and leads into one of the adjoining rooms we have mentioned. The wall itself is covered with white tiles, with hexagonal sinkings resembling a honeycomb, and borders with a dark blue ornament of a nondescript and indifferent character running round panels and pilasters. The upper part of the columns, answering to this space of the walling, is covered with a diaper pattern of white upon yellow, each diaper being upon a separate tile and stuck upon the backing or core with cement—a gimcrack contrivance to our mind, the perishability of which will, we think, soon assert itself. A frieze over each doorway is also left for some fillling in of an ornamental character, as also a square panel in a sort of monument, such as one sees put up to the memory of pet dogs, which is placed over the doorway for some purpose which has escaped us. This monumental erection breaks the frieze which crowns the wall-veil and runs round the apartment in a line with a band ornament put under the capitals of the pilasters and columns, about the same height, and of the same character as to effect as the band above the dado below. This ornamental frieze is composed of letters in white on on a yellow ground, with amorini gambolling in and among them. We tried to read it, but found some difficulty, and had to run against sundry refreshers of the outer man at the bar counter in the effort to do so, as the letters double round corners in the most provoking way. As we made it out it runs thus :—

> There is nothing better for a man than that he should eat and drink, and that he should make his soul enjoy good in his labour—X. Y. Z.

The triplet of letters forming the climax are comical, and strike one much as the twiddle-de-dee-dums with which a designer at his wits' end fills up a space which proves longer than he expected. We should certainly have recommended Q.E.D. as far more appropriate in this case, and should have advised most visitors in search of refreshment to have contented themselves by their assertion that the statement, whatever it might be, was a fact, and so save themselves the trouble we were at to decipher it.

The rest of the apartment—namely the upper part of the walls, spandrels over the arches, the windows and ceilings, are all profusely ornamented, or to be ornamented with Raffaelesque arabesques, the two former on a yellow ground, and the two latter on a white one, with some broad bands of blue introduced into the ceiling. Our readers are so well acquainted with this class of nonsense ornament that we spare them an elaborate description of the spasmodic monsters, a cross between pterodactyles and griffins, which are tied, efflorescent tail to tail, or made to alternate with jam-pots of mean capacity, though gorgeous form. The tones of colour, and the balance of ornament and space, are sufficiently well treated, and this is all we care to examine in such matters. We cannot refrain, however, from expressing our regret in parting company with this refreshment room that the prestige of Raffaelle, which has done such infinite damage to painting, that imitation of his technical skill superseded the recognition of common sense as the soul of art in his followers, should now corrupt the art-manufacture fostered at South Kensington. This spurious work of the Renaissance is, however, that which those in office there seem alone to study, although they are surrounded with specimens of the art of the best ages of the past; knowing, however, that it is hopeless at present to suggest a change, we content ourselves with this record of the fact, and on a future occasion shall contrast with the treatment of this central apartment those of its neighbours which have been designed and executed under other and better influence.

Those who would judge of this work of the South Kensington artists at its best should view and examine it by daylight, the sober light of which is most suitable to it, and the coolness of effect is pleasant in the hot summer daytime, whereas, all its defects, its glitter, and we must say clap-trap, are intensified by the glare of gas-light, and the yellow colour of its ground upon which so much depends is paled, while the blue, intended to contrast with it, and which is deep and quiet enough, is turned to black at night. This unsuitability, however, to a time when it is most visited, as, for instance, at the conversaziones often held in the museum, is a point to which proper consideration should be given.

WROUGHT IRON CRANES.

WHEN it is considered to what very violent jerks and sudden strains a crane is continually subject to, it is a matter of some surprise that cast iron should have been so much used in its construction. This can only be accounted for by the fact that a very large margin of superfluous strength is always allowed for in cranes, derricks, and all machines which have to do with the hoisting and transport of heavy materials. Timber is a good and reliable material for the construction of cranes, but unfortunately its powers of resistance are soon exhausted, and are totally inadequate to perform the onerous duties which are now demanded of it. A cast iron post and jib, and a wrought iron tie or arm, constitute the principal features of an ordinary crane. With respect to what has been already stated regarding the employment of cast iron in cranes, it should be borne in mind that the first shock or impetus of a sudden load is borne by the hoisting chain, and transmitted by it to the arm and jib. There is no doubt but that a portion of the wrench or strain affects these parts of the crane, but still the chain manifestly breaks the violence of the jerk. Similarly to its ancient predecessor, timber, the capabilities of cast iron are limited, although they surpass those of the former material. This is not so much owing to the absolute want of strength, as the crushing force of cast iron is very large, as to the somewhat treacherous nature of that substance, which is liable to fracture without evincing the slightest incipient weakness or deflection. This liability increases with the weight of the load and nature of the strain to which it is subjected, and it is therefore no wonder that engineers are cautious not to overtask a material that has frequently failed under very disastrous circumstances.

The usual form of a crane is well known, and consists of an upright post and sloping jib, and an arm which is sometimes horizontal, but more often inclined. This latter position increases the strain upon both itself and the jib, but possesses some advantages in diminishing the length of the upright pillar, and thus requiring less headway. But when cranes are required to lift twenty, and even thirty, tons, it is imperative to employ wrought iron, for two principal reasons : In the first place because a more reliable material is necessary to resist strains of so great a severity, and in the second because the peculiar form required cannot be obtained by the use of cast iron. In Fig 1 is represented an elevation of a wrought iron bent crane, and an inspection of it will at once point out the superior advantages possessed by that particular form. With the straight sloping jib it is impossible to hoist a load, especially if it be of a bulky shape, even nearly up to the top of the crane, but when it is arched, as shown in Fig 1, it may be raised close up to the under surface of the machine—in fact, as high as the shackle will permit. The utility of this arrangement in loading and unloading the cargoes of ships cannot be over-estimated. Wrought iron cranes may be constructed either on the solid or open principle. In other words, they may have the sides built up of solid plates, or made similar to those of a warren or lattice girder. The latter are rather the cheaper, as there is a saving effected in the workmanship, a great quantity of cutting and fitting in the plates being avoided. It is a very simple matter to cut the end of a small bar to any required angle, compared with cutting the edge of a large plate to a curved shape. Confining ourselves for the present to the solid-sided or plate crane, the section of one intended for moderate duty is represented in Fig 2. We shall, in another article, refer to the subject of the strains upon these structures, which require very accurate and careful calculation. The section is composed of one or more flange plates, which vary in scantling with the strains upon them, and as a rule increase from the summit to the end, where obviously the leverage tending to break the crane across is a maximum. The web or side consists of a series of plates rivetted together at the joints by wrappers of tee iron, which thus fulfil the double purpose of acting as covering plates for the joints and as stiffeners for the side or web of the crane. This is one of the disadvantages attending all iron constructions which are based upon the plate or solid-sided system. Whatever may be the strength of the web, so far as its sectional area of metal is concerned, it must be supplemented by stiffening pieces of some other form. In every description of girder the joints invariably constitute the weak points. In the plate form the joints in the web are very numerous, while in the open or lattice principle there are virtually no joints at all in the web, the bars of which, by virtue of their shape, carry their own stiffening within themselves. A glance at Fig. 2 will at once indicate that a large amount of extra rivetting is incurred in the solid side. This punching or drilling, as the case may be, of so many holes in close proximity to one another, must tend to produce a local weakness in the plates, in spite of the best manner in which the rivetting may be performed.

FIG. 1

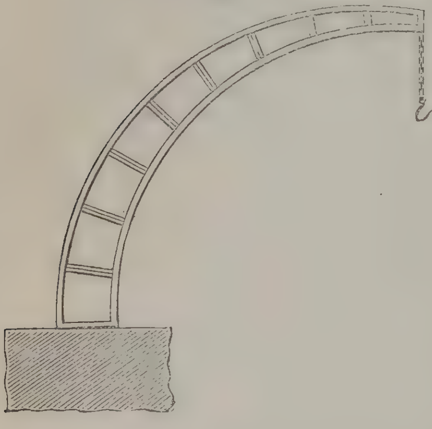

FIG. 2

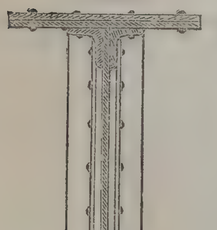

FIG. 3

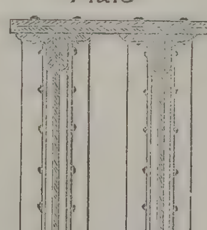

The section represented in Fig. 2, would answer only for cranes designed to lift a moderate weight. When the maximum load to be hoisted reaches to twenty tons and upwards, the section alluded to would be too weak for the purpose. It would not fail for want of absolute strength, but from want of the requisite rigidity. This is the fault of all single web plate girders, and the same remark applies to lattice girders, in which but a single row of diagonal bars is employed, either in the plane of the elevation of the girder or in that of its transverse section. Whenever the load exceeds about twelve tons, the crane should be made tubular, with a box-shaped section, represented in Fig. 3. The additional stiffness imparted by thus doubling the sides is at once apparent from a mere inspection of the drawing. There is an objection to this tubular form of crane which applies to all box girders of small dimensions. It is the difficulty, in many instances the absolute impossibility, of examining the interior after the separate parts have been put together. It may in some cases be just possible to give the inside a fresh coating of paint, but anything like a proper examination is out of the question. Rust and corrosion have full license to develop themselves unknown and unchecked. This objection is even urged with some degree of truth against tubular girders similar to those spanning the Straits of Menai, for although there is no difficulty in getting at the various interior parts of the bridge, yet the task of examination can never be so thoroughly and satisfactorily accomplished as in examples which are open to the light. We must reserve for another article the description and investigation of the manner in which cranes are affected by the strains they undergo, and the method of calculating them.

◆

HOW TO WRITE A SPECIFICATION.

It is, we think, Mr. Wightwick, the author "The Palace of Architecture," who, speaking of the anxieties of architectural practice, adverts especially to those attending the composition of a specification ; and ventures on the quaint assertion, "the architect's wife always knows when it is *specification day*":—

Hyperbole soars too high, or creeps too low ;
Exceeds the truth, things wonderful to show,

says an old treatise on rhetoric ; and doubtless there is a little hyperbole in this assertion of Mr. Wightwick's. If, however, he merely meant by it to show what a mental worry to the architect is the drawing up of a specification, it is hard to say how he could have more pithily expressed a well-known truth. The composing of a specification is unquestionably a disagreeable and anxious task at all times. It is not like the drawing up of a lease or a marriage settlement, a matter of very much routine and very little imagination ; but is really the concocting of a paper that shall possess to the full all the routine lore of the legal document, and a considerable amount of thought and special invention or imagination to boot. If every church or chapel, every warehouse or shop, and every mansion or cottage were alike, the labour of the architect in drawing up a specification would approach somewhat to that of the lawyer, and architects might hope to lay down for themselves some accepted form, or head and tail of a form, that would for all time serve all possible cases, if it were but to take the well-known exordium of, "This Indenture made and entered into this— year of our Lord—witnesseth,"&c., &c., and terminate with the good old peroration, "anything to the contrary hereof in anywise notwithstanding."

But, alas for the poor architect, it is not for him to exclaim, with the Virgilian Shepherd,

"*Deus nobis hæc otia fecit.*"

for neither gods, clients, nor contractors give him any such "ease," or, as the lawyers have it, "easement." No two of his buildings are alike, or sufficiently alike to warrant him in making the specification of any one of them do service for any other. There is nothing for it but to sit down and compose a special document for each individual case. We know very many architects of great skill and extensive professional experience who look with loathing on the task of writing out a specification ; and ludicrous tales might be told of attempts made to get over the difficulty, or rather the irksomeness, of the task, by setting some junior clerk to hash up or collate from one or more old specifications, by way of getting a lift to the solution of the hateful problem. Let us not disedify the young reader of this article by an exposure of any of these many "dodges," especially as we may safely predicate of them that they are all more or less futile, and that, by the time the task has come to an end, the composer invariably finds he would have done far better to have first looked his difficulty in the face, and have sat down to a bran new specification.

To architects (London ones *par excellence*) who do not take out and issue their own quantities, the drawing up of an original specification is an absolutely painful task, and one, moreover, that can only be accomplished with any approach to perfection by the previous getting out of a most complete set of drawings—such a set, indeed, as very few architects in large practice can hope to find time to prepare ; and even when they have done all this, the surveyor who is called in to take out the quantities for the builders will be almost certain to discover many matters inadequately or improperly specified, if not altogether omitted. Such architects do well to keep by them their old specifications, such at least as have been carefully prepared, and for edifices resembling, as nearly as may be, the work to be specified. We say advisedly *their* old specifications. If a man aspire to method and accuracy in composing his specifications, he can always with confidence collate from his own documents ; but with very little confidence or satisfaction can he copy the specifications of another. The chances are that his own old specification will have on its fly-leaf or margins some pencil notes of items omitted or ill-described ; and these he will find of great service in the composition of a new document.

Architects vary very much in the respective modes of composing these documents. Very many of them take an absolute pride in the length of their specifications. They stint the number of their drawings, and trust to the prolixity of their specifications to make up for their shortcomings in delineation. It is a signal mistake. The form, the size, the number, the position of any separate portion of an edifice can be far better and more clearly expressed by delineation than by writing ; and, where time admits, these matters should be described by drawing. When this can be done the shorter a specification can be the better it will be. Its province should be to specially define when or in what order, with what materials or ingredients, and in what style, quality. or manner the works are to be executed, leaving the drawings to explain their form, size or dimension, their number and position in the building; and, indeed, if architects would but observe this rule, we see no reason why some enterprising publisher of office forms might not with great advantage to the profession issue a set of printed skeleton sheets, whereon architects might draught out their specifications—such sheets to set forth the preamble, the general conditions and the trades in usual sequence; each trade sheet containing, pretty widely apart, marginal titles of the usual items of a building, for the architect to expunge or to fill up as he found necessary. On such printed sheets we would have printed in full for use all those stock clauses that every architect embodies as a matter of course in his specifications—clauses that, like the laws of the Medes and Persians, "alter not," such as the growth and seasoning and freedom from sap of the timbers, the thickness of mortar joints, the pargetting of flues, the goodness of stone and the placing it on its natural bed, &c., &c. These are matters that cannot be expressed by delineation, and which make up clauses that not only pertain solely to specifications but are of invariable use—stereotypical clauses in fact, that may very fairly be stereotyped for all time; and the mind of the architect may be set free from the bother of seeing to their due insertion in the right place.

We need hardly say that the most perfect specifications are, or ought to be, those which are written out by the person who computes the quantities, even though he be not the actual architect of the intended building, but an independent building surveyor. In either case, the usual process is to take out the quantities from the drawings with the aid of a rough general specification, this latter document being subsequently amplified and perfected by collation from the surveyor's dimension-book. In the process is very often involved a thorough over-hauling of the drawings themselves, which, however conscientiously prepared, will seldom be found to stand the test of a bill of quantities.

Specifications of alterations and repairs of buildings should always be drawn up on the buildings themselves, the latter being begun from the roof outside, thence continued to its inside, after that downward from topmost room to basement, ending with the stairs and passages, taken in like order. The greatest mistakes may be made by attempting to compose such specifications in the office, away from the structure to be altered or repaired

For the avoidance of errors and omissions in these tiresome documents young architects will do well to determine for themselves a handy rotation of trades and their respective items or operations; and, having done so, to adhere to it, and gradually acquire the habit of compiling future ones from their own documents alone. Their headings may be as copious and as oft-articulated or dissected as they please to make them, for all this tends to perspicuity, and perspicuity will ward off litigation, the very service a client requires in his architect. As to the paragraphs or clauses themselves, the shorter they are, and the more they can be exchanged for drawings, the better; indeed, we cannot better close these observations than by quoting the pithy remark of an eminent contractor, who, being asked to define in what a specification consisted, declared it to be simply "Drawings, drawings, lots o' drawings."

◆

Messrs. Osborne, Bros., the contractors, are making rapid progress with the erection of S. Paul's Church, on the Dane Hills, Leicester. The walls will soon be ready to receive the timbers for the roof. The church is being built with the granite of the county, relieved by dressed stone, red and black bricks being sparingly introduced.

THE RAPHAEL AND MICHEL ANGELO EXHIBITION AT THE BURLINGTON FINE ARTS' CLUB.

On June 17th, No. 806, we called attention to this Exhibition. It is, however, so interesting and important that we are justified in offering some additional remarks on it.

The idea of a Raphael Exhibition, for which, says the *Daily News*, we have in this country such special advantages in the Oxford University drawings, those of the Royal Collection, and the Cartoons, was a favourite scheme of the late Prince Consort; and under his direction a very extensive collection and catalogue had been prepared, which was placed in the reading-room of the Club by the permission of the Queen, with a selection from the drawings by Michel Angelo and Raphael. Fortunately for those who had not the privilege of seing these precious works on the one day they could be allowed to remain, the Queen, with her usual consideration, has ordered photographs of them to take the place of the originals, and they are now to be seen with the other drawings, which belong chiefly to Mr. John Malcolm and Mr. Henry Vaughan. Of those drawings from the Windsor Cabinet it would be impossible to express the singular interest; one feels a sort of awe in the presence of works which ever seem to be still fresh from the hand of the immortal artists. Such is the living freedom of line, the touch of vivid feeling, the sweep of power over the whole, that we seem to come nearer to these great limners than in looking at their more laboured and fully developed works. Here is the small study for the cartoon of the "Miraculous Draught," and that for the "Charge to Peter," in which Raphael has simply drawn his models in the ordinary slight dress they wore, intending afterwards to transform them into Christ and the Apostles by his own hand. In the Royal collection, also, another of the cartoon studies is preserved, that of the "Elymas." We may add that the sketch for the "Stoning of Stephen" is in the collection of the Archduke Albert of Vienna, and that for the "Paul preaching at Athens" is in the Uffizj at Florence. These, with the old engraving by the Master of the Die of "The Coronation of the Virgin," of which a copy (128) is exhibited amongst Mr. R. Fisher's fine collection of engravings, are the only records of the four lost cartoons, amongst which is "The Conversion of S. Paul," formerly known to have been in the possession of Cardinal Grimani. The immense superiority of these drawings over the large finished works, which, in fact, were generally executed by pupils, who enlarged them by squares from the master's work, is well shown in the exquisitely beautiful drawing in black chalk of "Cupid and the Graces," for one of the frescoes on the ceiling of the Farnesina, and very little of which was painted by Raphael at the time, and all that his pupils did has since been painted over by modern "restorers," so that the interest in these drawings is often far beyond that of the pictures. In the Queen's collection, also, is the unfinished drawing in red chalk by Raphael of the "Massacre of the Innocents," engraved by Marc Antonio, but of which the large work is lost except it be that fragment of a cartoon in colour in the National Gallery. The sketches for the entombment picture in the Borghese Palace, Rome, in pen and ink, show at the same time the wonderful gift of hand of Raphael and his extraordinary study of the figure. In one of the five for this picture in the exhibition, he has drawn the skeleton figure for the fainting virgin, to make himself quite sure of his drawing in this most dfficult group. Mr. Malcolm is fortunate in possessing another study for this group which we now see placed side by side with the one just mentioned. Many other sketches exist showing how Raphael studied the anatomy of the figure, and we have in the present exhibition a facsimile of the drawing by Michel Angelo in the Oxford collection representing himself and his friend, Andrea del Torre, dissecting a body. There are eighteen photographs of drawings by Raphael lent by the Queen from the Royal collection, and fourteen by Michel Angelo. Of these the most remarkable for that amazing power of drawing the figure in strong action which distinguished Michel Angelo above all compeers, was "The Archers"—a party of half nude figures running as they let fly their arrows at a mark—and "The Labours of Hercules," represented in three groups on one small sheet of paper. The "Prometheus" and "The Phaeton" are almost equally striking. The former are in red chalk and the latter in black. The "Bacchanals" is also a superb example, and the drawing in black chalk of a "Holy Family" is wonderfully graceful as a composition and very grand in conception, less conventional and more imposing than the one picture he painted of the subject which is one of the great treasures in the tribune of the Uffizj. There are several studies for figures in the great masterpiece of Michel Angelo—the ceiling of the Sistine Chapel, and the "Last Judgment," which occupies the whole of the end wall. Mr. Malcolm contributes a grand heroic head of St. Bartholomew, which was once in the Lawrence collection, and a study for the figure of Haman, which fills one of the angles of the ceiling, with others. Mr. Vaughan lends a most interesting sketch in pen and bistre for the "Isaiah," and Mr. F. Locker a beautiful study in red chalk for the "Adam"—one of the grandest figures ever conceived by the great man—which was formerly in the famous Lawrence collection. Mr. Vaughan's study for a figure in the celebrated cartoon of Pisa, as it is called, representing one of the battling soldiers, suddenly turning round at the alarm, is a precious relic of the lost work, the extraordinary beauty of which may be imagined from the fine engraving of Antonio Veneziano, known as "Les Grimpeurs" (dated 1524), and another, the work of Schiavonetti, which may be studied in the most important collection of old engravings lent by Mr. R. Fisher. These, indeed, are the only records left of designs by Raphael and Michel Angelo, which are lost; they are by Marco de Ravenna, Bonasone, Nicholas Beatrizet, Eneas Vico, Ghisi, and Caraglio. Eneas Vico, it will be remembered, engraved on a large scale the "Last Judgment," as Bonasone did smaller, and good specimens of both these are in the Exhibition. These are of great interest, because the fresco itself has long been too much injured and covered with incense smoke to be properly seen. But science has recently rendered the most invaluable aid to art in the magnificent photographs which have been taken of the whole of the ceiling of the Sistine Chapel, as well as the immense picture of the "Last Judgment." We perceive this has been accomplished by the employment of the magnesium light, and by taking sections of the picture at a time, which are then joined together. The full beauty of the work has certainly never been so well displayed in our time, and though we see the great cracks running in every direction across the picture, yet the majestic power of the design comes out over all these small blemishes of time. Some of the single figures completely realise the "mannera terribile" of Michel Angelo, and show how in his modern style he rivalled the beauties and grandeur of Greek art. The great frescoes of Raphael in the Stanze of the Vatican have been taken by the same process under the skilful manipulation of Mr. Adolphe Braun, and a fine series of these, contributed by Mr. Leighton, R.A., fills one side of the reading room of the club, while those of Michel Angelo face them on the opposite side. Amongst those from the works of Raphael should be noticed especially that from the famous "Heliodorus," and that from the full-sized cartoon for the fresco of "the school of Athens," which is preserved in the Ambrosian library at Milan. From these grand works, which represent the highest achievements of painting, it is deeply interesting to turn to those of such unaffected simplicity and sweet beauty as the silver-point drawings of Raphael in his youth, perhaps studied from his beautiful sister, which belong to Mr. Malcolm's collection, or the ideal heads by Michel Angelo—"A Warrior," and that known as "the Marchioness of Pescara," which came from the Buonarotti family, also from Mr. Malcolm's collections, or the beautiful "Cleopatra" (101) belonging to Mr. Vaugham.

The exhibition is to remain open to the end of the season.

◆

CARNARVON CASTLE.—Mr. Llewellyn Turner, the Deputy-Constable of Carnarvon Castle, denies the statement that the London and North-Western Railway have tunnelled beneath that great national monument, between which and the railway there is a whole row of houses, erected nearly 50 years ago. The castle authorities, he adds, have removed some thousands of tons of rubbish from the interior, and cleared the moat of the rubbish with which the Vandals of 50 or 60 years ago filled it up. These excavations are constantly bringing to light the hidden beauties of that singularly elegant structure, which the late Mr. Hartshorne, declared was the most splendid specimen of its kind in Great Britain—the second in Europe

A STEEP RAILWAY.

A RAILWAY has been constructed in Pittsburg, Pa., to carry passengers to and from the top of what is known as Coal Hill, which overlooks the city and the country around to a great distance. The plane is located 250ft. west of the Monongahela suspension bridge. The roadway, starting from Carson-street, crosses the Pan Handle railroad, and reaches the face of the hill (which at this point is 90ft. above the level of the Pan Handle railroad track) by means of an iron bridge 160ft. long. This bridge is supported by 10in. columns, made of wrought-iron ¼in. thick. The vertical height of the hill at this point is 330ft., giving the plane a length of 650ft., and an inclination of 35 degrees. The roadway consists of two tracks, each 5ft gauge, with two cars—one ascending while the other descends. The cross ties on the iron bridge are yellow pine, 7ft. by 7ft. The stringers are also yellow pine, 6ft. by 8ft., and the ties on the balance of the track 8ft. by 8ft. A pine railing runs from the base to the top of the incline. It is 3ft. high, and quite fancy. It is to be painted—probably white. The rails are of the T pattern, and substantially fastened to the stringers. The cars are to be hauled up by a wire rope, and are provided with a safety cable which runs idly except in case of the breakage of the principal rope, when the drum about which the safety cable winds is held by means of a brake, thus preventing the accidental descent of a car.

◆

THE CONSTRUCTION OF GRAVEL WALKS.

By Wm. H. Grant, Engineer.

THE following general directions for the construction of gravel walks are largely the result of experience obtained during the progress of the work on the New York Central Park.

1st. Excavate a trench the width intended for the walk, 10 to 12in. deep, leaving the bottom even and regular, and slightly crowning in the centre, unless the walk is to be quite a narrow one. If the ground is not hard and firm, pass a garden-roller a few times over it. If it is wet and heavy, lay a line of 1½in. drain tiles (using collars) along the walk, as near the centre as practicable, and at a sufficient depth to be below the reach of frost.

2nd. Fill the space excavated for the walk 6 to 9in. deep with field or quarry stones, placing the smallest on top. Select the softest and easiest stones to break, and hammer them up on top of the stone filling until the interstices are sufficiently filled to exclude the gravel. Rotten or partially decomposed stones will answer well for this purpose, or, if this material is not convenient, use a light layer of gravelly loam, or hard pan. The surface will be further improved, previous to putting on the gravel, by sprinkling it and going over it a few times with the roller. The object of the process, thus far, is to secure a firm, well-drained foundation for the walk, having the surface interstices of the stone filling sufficiently closed to prevent the gravel from running down and filling up the voids below, and yet leaving free vent for surface water to percolate through.

3rd. If the stone filling is well prepared in this way, and the surface made even—no points of large stones projecting, &c.—2in. in depth, of hard fine gravel will be sufficient to complete the walk. In applying the gravel, a light layer should be first put on, and raked over evenly, working the coarser gravel forward into any interstices or inequalities of the stone filling. Moisten this layer and roll it down firmly and evenly. The second and last layer, to make the most agreeable surface, should be passed through a screen, the meshes of which are not more than 3-16th of an inch wide, and care should be taken, in applying it, not to rake up the first layer, and to spread it evenly—holding the handle of the rake nearly perpendicular. If it is not screened, more pains must be taken (with a fine rake) to exclude from the surface gravel that is too coarse and unequal in size to be agreeable to the foot. Next, and lastly, sprinkle and roll the whole thoroughly. The gravel should not be drenched, but only made moist or damp, in order to pack well under the roller. Until the walk has received some wear, it will be necessary, after dry weather, to trim the surface anew with the back of the rake, and to repeat the rolling occasionally. Roll after light rain, but never when the gravel is dry, or when too wet.

4th. A slight intermixture of clay or loam with the gravel will serve to make it pack or "bind" more firmly, when desirable, and with less use of the roller, but this should be done with moderation, and no vegetable mould should be introduced to encourage the growth of grass or weeds. It is a great advantage to procure pure gravel; its freedom from earthy or vegetable matter prevents, not only vegetation from taking root, but the liability to dust in dry weather, and a muddy or slippery surface in wet weather; it also prevents the action of frost. It is better, therefore, to avoid any intermixture of other substances that will defeat these objects.

5th. The surface of a walk should be a little crowned in the centre, and should be provided with outlets through the grass borders, at suitable points, to carry off sudden accumulations of water. Where the walk has much inclination, and also where the outside drainage, from adjacent ground, is liable to be brought to it, more frequent outlets, cross drains, &c., must be made.

6th. If, for any considerable distance along the walk, drainage water from sudden rains can not be conveyed away from it securely by these means, *gutters* must be made. These can be made in a variety of ways, but there are no gutters that give more permanent satisfaction, at a moderate cost, than those formed neatly with small cobble stones; suitable stones for the purpose can generally be selected from the gravel delivered for the walk, or from the pit from which it is obtained.

7th. *A system of walks*, extending over a large area of ground that is not naturally adapted to easy surface drainage, must have one or more *main underdrains*, with subordinate or branch drains entering them from various points of the system, and with inlets from the gutters of the walks, silt basins, &c.; all of which must be adapted to the local circumstances in each case, by special study or survey, and no general rule can therefore be given for their treatment.

8th. A walk can be cheaply made on light, well-drained soil, by simply removing the turf to the depth of three or four inches, and filling the space with gravel, raking the coarse forward into the bottom, and leaving the fine on top; one-half of the gravel in this case (in the bottom), may be of inferior quality.

Estimate of Cost of Gravel Roads and Walks.

The following estimates were made during the construction of the work in the Central Park, and are based upon the average prices then paid for labour and materials, except as is otherwise noted:—

Road	10ft.	wide,	without	gutters	0.60dol.	per ft.
,,	15		,,	,,	0.90	,,
,,	15	,,	with	,,	1.10	,,
,,	20	,,	,,	,,	1.30	,,
,,	25	,,	,,	,,	2.45	,,
	30	,,	,,	,,	2.80	,,

With Telford, paved bottom, instead of rubble, but in all other respects the same as above

Road	25ft	wide,	with	gutters,	2·95dols.	per ft.
,,	30	,,	,,	,,	3.42	,,

The following data are assumed:—

1st. That one foot in depth for the width of the road will be excavated, in ordinary earth, besides the additional excavation for drains; the surplus material excavated, it is supposed, will be needed in shaping the borders of the road in the vicinity.

2nd. That stones can be obtained (in the country) at 70 cents. per cubic yard.

3rd. That the necessary sledging, or breaking up of the larger stones, will cost 30 cents. per cubic yard; the depth of the layer of stones to be 9in. for roads of 20ft. or less in width, and 12in. for roads over 20ft. in width.

4th. That the best hard gravel can be obtained at 150 dols. per cubic yard; the depth on roads of 20ft. or less in width to be 3in., and on roads over 20ft. in width 5in., and the gravel to be very coarse.

5th. That the gutters are to be made of small cobble stones, set in a neat manner, and 18 to 20in. wide for roads of 20ft. or less in width, and of larger cobble stones, or selected field or quarry stones, and 2 to 2½ft. wide, for roads over 20ft. in width.

6th. That the roads are to be thoroughly rolled, and made in all respects in a substantial manner.

7th. One tile drain is estimated for the narrower roads, and two for the wider ones, sunk 3ft. deep below the surface.

The roads of 20ft. in width and under are intended especially for private roads. A variation in any of the data will, of course, affect the cost of the road; the cost will also be influenced by the extent of road made, a large amount of work being done at a proportionably less expense than a small amount. It is assumed in these estimates that not less a length of road will be made than about 500ft. This is as near as it is practicable to give general rates and estimates. There are many circumstances—of locality, facilities for economising materials and labour, &c.—that may reduce these estimates, and still admit of substantial work. There will also be cases where the cost of some one or more of the items in these estimates may be increased; as, for instance, in some localities it may not be practicable to obtain suitable stone without resorting to quarrying and blasting, which would increase the expense of that item.

Cost of Gravel Walks.

Walk,	5ft.	wide,	15	cents	per ft.
,,	8	,,	20		,,
,,	12	,,	50		,,

It is assumed that 1ft. in depth for the width of the walk will be excavated in ordinary earth; that 9in. in depth of rubble stone will be used, and 2in. in depth of gravel; and that the walks over 5ft. in width will be underdrained with tiles, laid securely below frost.

On side-hill ground, or where the wider walks are peculiarly exposed to wash, a gutter may be needed on one side, with occasional cross channels to turn the water off. For this there must be added—the work to be done in a neat manner with small cobble stone—10 to 15 cents. per running foot of gutter. By a proper disposition of "sodgutters," as heretofore explained, much of the exterior drainage can be excluded from the walk, thus obviating the necessity, in most cases, for a formal stone gutter, and protecting the gravel also from being swept off by heavy rains, for which no other means are so efficacious, or so simple and objectionable in application.

A special chapter might be written to illustrate the necessity of thorough drainage in connection with roads, walks and lawns. There is no greater difficulty met with in the construction and maintenance of such works than that caused by the sudden and heavy rain-falls of our climate upon large spaces and long unbroken slopes of ground. The amount of damage that is annually done for the want of proper safeguards and precautions is, in many cases, greater than the cost of preparing them. The gullying of roads and grounds is very annoying, aside from the cost of repairs; and if, after the occurrence of such a mishap, and all the dilapidations are made good, there is an apprehension that it may occur again at the next shower, there can be but little enjoyment to a proprietor of all his labours and expenditure The only remedy that can be suggested is in the treatment that has been pointed out—varying and adapting it, as must needs be done, in each particular case, to the local characteristics of the ground, after a careful study has been made of the premises and surroundings.

◆

Elm Trees in Dry Weather.—Mr. Menzies, the Deputy-Surveyor of Windsor Forest, gave evidence on Monday, before the coroner's jury who inquired into the death of a young man who was killed on Sunday evening by a bough falling from one of the elm trees in the Long-walk, Windsor-park. Mr. Menzies stated that elm trees such as those in the Long-walk were the most dangerous they had. During great heat and great drought, branches of elm trees were exceedingly liable to fall without the slightest notice or warning, and green branches much more so than dead ones, even in the calmest weather. He constantly warned pic-nic parties sitting under elm trees in hot weather of the danger they ran, and that they would be safer under any other sort of tree.

Cheapside and the Poultry to be Paved with Asphalte.—The City Commissioners of Sewers, at their meeting on Tuesday last, unanimously adopted the report of the Streets Committee, recommending, on the advice of Mr. Haywood, the Engineer to the Commissioners, that Cheapside and the Poultry be forthwith paved with the Val de Travers asphalte, as laid down in Threadneedle-street. The maximum cost will be 18s. per square yard, and 1s. 6d., for repairing.

Furniture & Decoration.

ON THE USE AND ABUSE OF ORNAMENT AND COLOUR IN THEIR APPLICATION TO HOUSE DECORATION.

(*Continued from page* 42.)

IN the decoration of our bed-rooms, paperhangings are almost universally used for the covering of the walls, and if properly hung, and well chosen as to colour and finish, may be considered as most appropriate. The choice of colour is not limited in quantity, although it is so in degree, inasmuch as dark or strong colours are out of place in bedrooms, the chief end to be kept in view being cleanliness, neatness, purity of colour, and unobtrusiveness, neatness in pattern and general arrangement, light and cleanly colouring, quietness and repose of effect.

In selecting the paper for a bed-room, care should be taken to avoid those spotty-patterned papers we have spoken against in a former article, as no class of papers can be more annoying or in worse taste than spotty patterns, especially in the bed-room. A bedroom, to be pleasant and healthy, should appear to be scrupulously clean, as well as being really so in fact. The days of heavy bed-hangings and darkness-producing window-curtains is happily gone by. Beds, bed-room furniture, and decorations are approaching something like what they ought to be in order to preserve health. The wall paper should be coloured in tints of light warm greys, with pink or reddish mauve outlines to pattern; light creamy drabs, with pattern in white, outlined with a darker shade of the same colour. There are some of these grey papers which have yellow outlines to the patterns; these, when hung, have a dirty look. This is always objectionable, as cleanliness is an indispensable in a bed-room paper. These light-tinted grey, or grey and white papers, are very pleasing in effect in all rooms which face the east or south, but when the room faces the wintry north the tone or tint of the paper should be of a warmer colour. If grey, the grey must have a larger portion of red in its composition, or else have a portion of red and yellow in its pattern. Good satin or glazed grounds wear the best, especially in these very light colours. The ground may be glazed, and the pattern dead colour, or *vice versa*. The effect is good in either case. As to their general utility, smooth or satin papers do not catch or hold the dust so much as if they were wholly dead colours, which are necessarily rough, and what dust the satins do gather is much easier brushed off than it is off the dead colours. Another advantage they have over dead colours is the fact that they do not absorb moisture or damp so soon as dead colours; the smoothness of the surface rather tends to throw off the moisture than to absorb it. Borders may be used with advantage to the appearance of the room. As a matter of taste we prefer to have them narrow and unpretentious when placed upon a pattern paper. They make a very appropriate and effectual finish to a bed-room. The ceiling may be either white, with a few tints of colour in the cornice, or the flat of the ceiling may be tinted with a colour which will contrast and yet harmonise with the prevailing colour of the walls.

The woodwork of a bed-room should be painted in tints of colour in harmony with the paper, For instance, if the paper has a grey ground with a white pattern, edged with pink or reddish violet, we should paint the panels grey, the stiles white, and the mouldings cream colour; and if there is a narrow bead on the inner edge of the mouldings next the panel, we should paint that pink or reddish violet; or if there be no bead, we should run a line of the same colour upon the panel. These grey, white, and pink papers are very cleanly, looking and pleasant; but they do not fulfil the conditions requisite to produce harmony. We therefore put cream colour on the moulding of the woodwork in order to supply that omission.

We object altogether to the use of imitations of woods in bed-rooms, excepting hotels or other such places where real hard service is required. Bed rooms, in towns especially, should be painted afresh every two or three years. This leads us at once to the consideration of what is really the most important aspect of the question—namely the sanitary condition of our bed-rooms, so far as regards our subject. Of all the rooms we inhabit the bed-room should be the freest from all suspicion of uncleanliness and from impure air. In our sleeping state we have less power to resist the injurious effect of foul air and other impurities engendered by neglect and uncleanliness. Personally we have an objection to paperhangings, from the fact that they are very liable to be used as a covering for the accumulated dirt of years. In many houses one paper is put upon another, time after time, until there is a gathering of perhaps five or six, and sometimes more layers of paper, paste, size and dirt, forming a mass of matter which only requires favourable circumstances to become putrescent, and in damp weather, or when closed up for a time, they soon begin to get mouldy and musty smelling. The accumulation of size, flour, paste, and the absorption during all these years of the foul gases created in all inhabited rooms, and which we believe wall papers absorb and retain, all tend to form a mass of corruption little dreamt of by those who inhabit them, and whenever there is the slightest damp in the walls the flour paste begins to ferment, mould forms, and we know not how many or what kind of diseases may be originated and fostered by such corruption. Let us turn for a moment, for the sake of contrast, to some of our farmhouse and rural cottage bed-rooms in Warwickshire, Worcestershire, and the northern counties. The rooms, as a rule, are low enough truly, and the accommodation is of the rudest, but we shall find the walls and ceilings perhaps whitewashed with lime, beautifully clean-looking, the bits of bed hangings and counterpanes white as snow, and trimmed with a strip of blue braid, or possibly they may be made of the old-fashioned blue and white gingham or check pattern; a strip of carpet at one side of the bed, or possibly all round it, a chair or two, and a table completes the furniture, but how clean and sweet smelling and health-giving everything appears!—and not only appears, but is so. No musty fusty smells — no decaying matter on the walls to create disease. In such a room we lie down with pleasure, and rise refreshed. No wonder that health comes back to us, and with the aid of fresh air, regular and simple habits, and good appetite, we regain lost strength and energy, and go back again to the daily routine of city life like giants refreshed, to battle and toil with the world again—for a time.

Now, in our town houses we reverse this state of things altogether. Every inch of floor must be covered with thick carpets, which are perhaps only taken up once in three months, and in many cases, once in twelve months; and when they are taken up, the amount of dust, dirt, &c., which gathers underneath them in that time is alarming from a sanitary point of view. When the carpet has been down for a length of time, the dust rises by the pressure and motion of walking, and thus makes the air we breathe impure; this will be the case however carefully they are brushed and swept; this is also one fruitful cause of bad smells, for wherever dust accumulates, foul smells will also exist. In houses where much gas is burnt in the lower rooms, the bed-rooms above are almost invariably unhealthy, as the burnt air ascends to the bed-rooms, vitiates the air, and thus injures the sleepers. We believe that there is no remedy for this, except every burner is connected by tubes or otherwise to a ventilating shaft, which will remove the burnt air and escaped gas as fast as it is produced. And we cannot see why this may not be done cheaply and effectually in houses and shops which are built; in houses to be built the matter would be simple.

All walls which have to be papered, even if they are new, should be well rubbed down with a large piece of pumice stone, cut and rubbed to a flat side—this will take off all bits and projections. All holes, cracks, and broken places should then be carefully stopped with plaster of Paris. The smallest crevice will serve as a breeding-place for vermin, and no house is safe from them, as they are often in the wood when the house is built. Whether they get into the unsound wood when on shipboard, or are brought from the forests, is a question we cannot solve. When the walls are well rubbed down and well dusted, they may be sized and papered in the usual manner, but care should be taken that all edges, corners, and laps, are well pasted down, so that there may be no opening for vermin to get under the paper. But if we are about to re-paper a bed-room, or, in fact, any room, the old paper should in all cases be stripped off, and every particle of the old paste washed clean off the walls; every hole and crevice should be stopped as before described. The walls should then be washed over with a weak mixture of carbolic acid and water, or other disinfectant, in order to destroy any remains of mould or fungi which may have germinated from the decay of the flour paste. Except this is done the mould is sure to appear again, and quickly, for there is scarcely any thing so difficult to eradicate if once it gets hold; but if these precautions were taken every time a room is re-papered our bed-rooms would be much more healthy than they now are. A great improvement would be made in our bed-rooms if the walls behind the skirting boards were plastered or cemented down to the flooring-boards, instead of their being as now unplastered, thus leaving a cavity for the accumulation of dust, and the harbouring of mice and other vermin, and the consequent conservation of bad smells.

A very nice style of decorating a bed-room is to paper it with one of those self-coloured papers (that is, paper that has been coloured in the pulp)—of which there are many tints made. They may be had from thirty to thirty-six inches wide. If the room is done with one of these, of a suitable tint, and a neat floral border run round the top and bottom, the result will be pleasing and good. These papers have an advantage over any other, inasmuch as they have no ground colour upon them, and thus we have less colouring matter on the walls than by any paper or other process. Bed-room walls simply coloured in distemper, with an agreeable tint of colour, and bordered with a paper border, are also very, clean-looking and healthy; in fact, this is the least objectionable manner of decorating bedrooms, as we get rid of the necessity of using flour paste, which is always a danger, and thus reduce the evil to a minimum.

Much discussion has taken place as to the injurious effects to be apprehended from the use of green paperhangings. We object altogether to their use in bed-rooms, in the first place as a matter of taste, and secondly, because there are certain bright greens which will not bear a sufficient quantity of size or glutinous matter to be mixed with them to bind the colour fast to the paper; the consequence is that there is always a danger of the green rubbing off and getting on to the night-clothes, of children especially, and thus injuring the system, and in dusting the walls the green will be brushed off the papers and lodge anywhere and everywhere in the room, and thus we may get it into our lungs, and we have no doubt but that in certain damp conditions of the weather, or of the air of the room, the green may give out exhalations injurious to health. A strong argument in favour of this view is the fact that we have known several working paperhangers who were always made ill if they had to hang one of these bright green papers, and we are strongly of opinion that if they are to be used at all they should always be glazed, so that the colour will not rub off easily. Intensely bright greens are decidedly dangerous, and the safest plan, if we are to have green papers, is to select what are called made greens, of which there are all shades; these, although not so bright, allow of a sufficient quantity of size to be used with them, so that they will not rub off, this being in ordinary cases the real point of danger.

(*To be continued.*)

◆

PARLIAMENTARY NOTES.

Southwark Park.—Mr. Locke, on the 14th inst., asked the Under Secretary of State for the Home Department, with reference to the deputation from inhabitants of the borough of Southwark which had been recently received by him, whether he had taken any steps with a view to prevent the erection of buildings in Southwark Park.—Mr. Knatchbull-Hugessen said the question related to a matter of some considerable importance. In 1864 an act was passed under which the Metropolitan Board of Works purchased 60 acres of land for a park. At the time of the purchase they intended to sell 16 acres of land for building purposes to recoup themselves for their expenditure of £100,000. The inhabitants had protested against this appropriation of the land. They alleged that the ground to be taken was land required by the population of the neighbourhood, and that, looking at the peculiar formation of the park, the severance would deteriorate the value of the remainder. The only step that he could take was to bring the matter under the consideration of the Home Secretary, and, if it was thought desirable to do so, to call the attention of Parliament to the subject.

The New Refreshment-Rooms.—Mr. Bentinck asked the First Lord of the Treasury whether her Majesty's Government intended to adopt the plan for new refreshment-rooms which had been altered from the plan of Mr. Barry of 1869, and with any and what modifications; and whether it was not to the advantage of the public service that that altered plan, which interfered materially with important architectural features of the Palace, should be prepared and executed by a competent architect, in accordance with the second report of the committee of the House of Lords.—Mr. Ayrton: As the question of the hon. gentleman, although addressed to the First Lord of the Treasury, relates to the business of the Office of Works—(hear)—I have to state that it is the intention, I believe, of the Secretary of the Treasury to lay on the table of the House in a day or two the estimates for the special service of the Houses of Parliament. That estimate will embrace the plans which have been submitted by the Office of Works for consideration to a Select Committee of the House, and unanimously approved of by them, and which I trust will lead to the convenience and comfort of hon. members. The hon. gentleman is pleased to say that the plan is altered from Mr. Barry's plan. Well, the plan is not Mr. Barry's, but one prepared by the officers of the Department of Works. The plan relates both to the House of Commons, and, in a small degree, to the House of Lords. The House of Lords, undoubtedly, in their first report, took great exception, in an architectural point of view, to some statements I had made. They combated my views at considerable length; but on reflection they presented another report, in which they acquiesced in my views—(laughter)—and the critical affair that arose between myself and the House of Lords is, therefore, at an end. (Cheers and laughter.) With regard to details, as I shall have to explain the estimate when proposed, it would not be right that I should now do so; but I can assure the House that the plans have been prepared entirely to meet the convenience of the House, on which members will be enabled to form an opinion, and, perhaps, a better opinion than any architect, however distinguished.

Sewage Utilisation Supplemental Bill.—This Bill was read a second time on Monday.

The Thames Embankment.—The Comptroller of the Household brought down on Tuesday, the following answer from her Majesty to the address of the house, respecting the open spaces on the Thames Embankment:—"I have received your Address, praying me to give directions that no public offices shall be erected on that portion of the Thames Embankment reserved to the Crown, and which has been recovered from the river at the cost of the ratepayers of the metropolis. As no public offices can be erected on the ground in question without the vote of Parliament, the house has in its own hands the means of giving effect to the prayer of the address. My Government will not ask for such a vote unless it has reason to suppose that it would be likely to meet the approval of the house. In reference to the prayer of the address as to the use to which the ground in question should be applied, it is necessary to observe that the property was created by the recent Act in exchange for valuable interests, and that such a limitation of its use does not appear to have been within the contemplation of the statute; and that if it is desired it ought to be imposed by an act of the Legislature or a bill for the purpose, which would give the opportunity of examining into the whole question in its present and prospective bearing. If such a bill is introduced I will give directions that the free discussion on it shall not be hindered by any formal difficulties which it is in the power of the Crown to remove, nor will any action be taken during the current year to appropriate the land in question, or to interfere with the decision of the question."

BUILDING NEWS SKETCHBOOK. XXXVII

◆

DOORWAY, INTERIOR OF S. ALBAN'S ABBEY.

The doorway from which this sketch is taken is situated in the beautiful screen dividing the nave from the choir (or ante-choir or baptistry), which is somewhat like the high altar screen, and was probably built at the same time—about the 14th century. G. R.

◆

THE LEGAL STATUS OF BUILDING SOCIETIES.

A DEPUTATION, representing 116,900 members of building societies, having an aggregate capital of £5,000,000 established in various parts of the metropolis and the country, waited on Monday afternoon on Mr. Bruce, the Home Secretary, to urge upon the Government the desirableness of passing the bill now before Parliament which proposes to deal with their societies this session. Mr. T. Hughes, M.P., Mr. J. Locke, M.P., and Mr. W. M. Torrens, M.P., formed part of the deputation. It was pointed out to the right hon. gentleman by Mr. T. Hughes, M.P., that, under the law as it at present existed, building societies suffered great inconvenience from being classed together, under the jurisdiction of the Registrar, with co-operative, friendly, and other societies, with which they had no connection; and it was with the view of remedying this state of the law that the deputation begged the Government to have the Bill referred to passed this session.—Mr. Stainsby referred to the uncertainty which at present existed as to the *status* of building societies, especially as regarded their borrowing powers. The position of building societies was just now such that unless some change to the law were made there was a great chance of their being threatened with impending ruin.—Mr. Bruce asked what there was at present to prevent the passing of the Bill being put off for another year?—Several members of the deputation replied that what had recently taken place in the House of Commons and the law courts had created great distrust in the public mind, and a panic might at any moment be brought about.—Mr. Bruce reminded the deputation that the objections to the Bill had been raised on the Opposition side of the House. The Government were favourable to the Bill, and he should have moved it be referred to a Select Committee had there been time. In reply to Mr. Torrens, the right hon. gentleman said if the Opposition were appeased, the Government would support the Bill. If there was not time to pass a perfect measure they would support any feasible plan.—The deputation, having thanked the right hon. gentleman, withdrew.

Benefit building societies are now governed by 6 & 7, Will. 4, c. 32, and those provisions of 10 Geo. 4, c. 56, and 4 & 5 Will. 4, c. 40, which, although those Acts are repealed, are kept on foot for the purposes of building societies. By a Bill now before Parliament, it is proposed (says the *Solicitors' Journal*) to repeal 6 & 7 Will. 4, c. 32, and, by implication, the provisions of the other two Acts, and to substitute for them the provisions of the Bill; but the Bill proposes rather to consolidate than to alter the existing law relating to these societies. Some alterations are, however, to be made, of which the most important are the following:—"The appeal to the quarter sessions in the case of the registrar refusing to certify all or any of the rules transmitted to him is abolished. The restriction of the amount of shares to £150 is abandoned. The rules are to state the manner in which the funds of societies are to be invested. The rules are to provide for a general statement of the funds and effects of the society, with an account of all moneys received and expended on behalf of the society, being prepared at least annually, and attested by two or more members of the society, or other persons appointed by the auditors, and countersigned by the secretary. Amalgamation of two societies, or the transfer of engagements from one society to another, is to be feasible, with the consent of the major part of the trustees and of the committees of management of both societies, or of the majority of the members of each such society. A society is to be wound up voluntarily by five-sixths of the members signing the proposed plan of dissolution; or compulsorily on the petition of any member or creditor, if the Court shall so order. 'The Court' throughout the Act is to mean, in England, the county court of the district in which the society carries on business. Lastly, there is a clause in the bill empowering societies to receive deposits or loans 'to be applied to the purposes of the society,' but no member is to receive any interest or dividend by way of annual or periodical profit upon his share until it is paid up or realised, or until he withdraws from the society. This clause will set at rest the *vexata quæstio*—can building societies borrow money—certainly as regards all future societies, and as regards existing societies also, if it is held to be so far retrospective as to sweep them in, or is made so before the Bill becomes law. This clause, and the provisions placing building societies under the jurisdiction of the county courts, are practically the most important innovations of the Bill."

◆

COMPETITIONS.

Swansea Guildhall.—The plans of Mr. C. J. Phipps, F.S.A., of London, have been selected as the best by the committee of the Corporation of Swansea for the enlargement of their assize courts, and other alterations. The plans provide for an outlay of about £2500.

New Workhouse for Clitheroe.—At a meeting of the Building Committee of the Clitheroe Guardians, held on the 4th inst., the following plans for the proposed new workhouse were received and examined:—"Utility and Economy," "Acorn," "Fiat Justitia," "Design of Freemasonry," "Simplicity and Economy," "Faith," and "C.," seven in all. The committee made a preliminary selection of four designs, in the following order:—"Utility and Economy," estimated cost, £6500; "C.," estimated cost, £5984 (in this plan there was a deficiency of infirmary accommodation, but a letter had been received from the architect, in which he said that by doing away with the porter's lodge there would be accommodation for 38 more patients in the infirmary than at present); "Fiat Justitia," estimated cost £5500; and "Simplicity and Economy," estimated cost, £5500, with a contingency of £800. The Guardians (who appear to be unaided by professional advice in the selection of a design) have deputed the Building Committee to make the final selection from one of the four designs mentioned.

Margate Jetty.—At a special meeting convened for the purpose of considering the proposed extension of the jetty, the directors have come to the conclusion to take immediate steps for its enlargement and improvement, and advertisements will be forthwith issued inviting persons to send in plans, and offering a premium for the best design.

◆

The Romford Burial Board is taking steps to provide the town with a new cemetery, at an estimated cost of £4500.

Sherborne School of Art.—An appeal is to be made to the town and neighbourhood for the amount wanted (about £100), to enable the committee to open the school at once. Premises have been converted for the school at an expense of £92.

TOMB OF GUGLIELMO DA CASTELBARCO, VERONA.

SKETCHED BY JAMS REDFORD, A.R.I.B.A. 1863.

TOMB OF GUGLIELMO DA CASTELBARCO, VERONA.

"In fair Verona, where we lay our scene," as our own Shakespeare expresses it, the great Italian poet Dante found a refuge ; it is also remarkable for the Roman amphitheatre, the Campanile, and its tombs. Our illustration is from a sketch made by Mr. James Redford, A.R.I.B.A., of Manchester, in 1863, and is a view of the monument erected to the memory of Guglielmo da Castelbarco (ob. 1320), who was the friend and adviser of the Scaligers, the *Capitani del Popolo*, and who lived in "Verona la Degna" at the same time (1302) as were numbered amongst its inhabitants Romeo de' Montecchi and Guilietta de' Capelletti ; or de Capelli, immortalised by Shakespeare.

The principal material with which the tomb is constructed is a red tinted marble, the bearing shafts alone being of white marble. Iron ties are used to connect the capitals of the columns and hold the monument together, "the one radical and condemning defect. This, however, is soon forgotten when one feels that there is no pretence ever or anywhere at its concealment. Notwithstanding this defect, one cannot help loving, and admiring them ; for there is a grace and beauty about the form and proportion of the Veronese trefoiled arch such as I have never seen, I think, elsewhere ; and the very flatness of the carving and the absence of deep moulding seem all adopted in order that nothing may interfere with the simple beauty of the outline of the arch."*

The pyramidal roof is formed of flags only, cramped together, and is without vaulting. The *sarcophagus* is supported by the sculptured representation of two couchant lions, and has carved upon it armorial bearings and the Virgin and Child, with the individual to whom the tomb is erected supplicant.

The monument is erected upon the wall, and over the entrance to the graveyard of the chapel of San Pietro Martire, formerly the cloisters attached to the church of S. Anatasia, of which Guglielmo da Castelbarco was a benefactor. In its remarkable position, in the busiest part of the town, the tomb strikes the stranger with a feeling of novel awe, and he cannot help but admire the poetic idea which placed the remains, apart from all contact with the earth and the quiet of a graveyard, where his fellow townsmen would look up to him still in death, and be ever reminded of his benevolence. The situation has also proved a place of safety, for there that recumbent effigy has lain for centuries undisturbed, making it appear that Guglielmo da Castelbarco is still watching over the city in which, during life, he took so prominent a part. Under its shadow, generations have played as children, learned as youths, bartered as men, and gone tottering down to the grave ; various exciting scenes have been enacted, and Verona itself has been lost and won many times.

◆

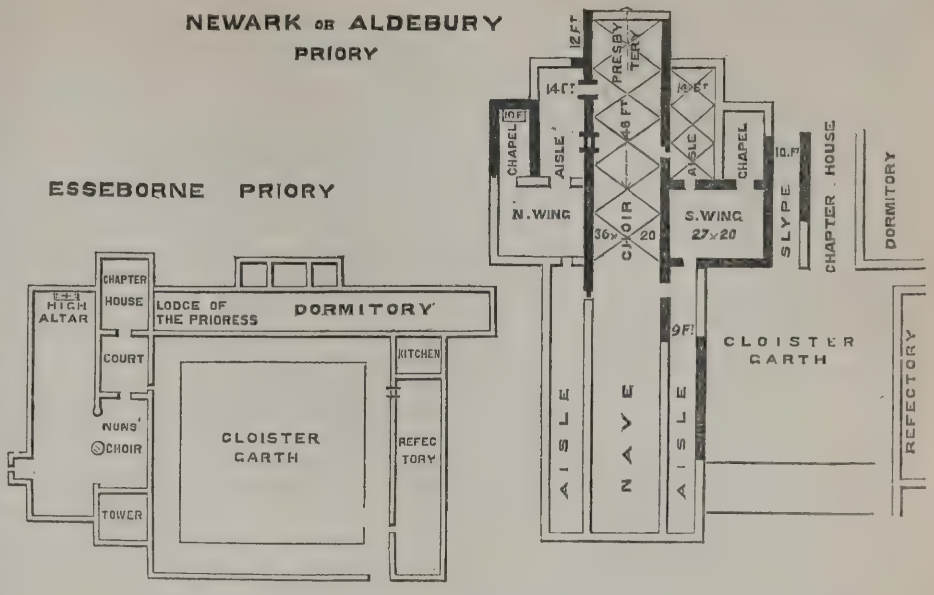
OLD PRIORIES.

◆

ESSEBOURNE PRIORY.

This Priory, stated to have been held by Benedictine nuns, is in an obituary roll of Durham called the Augustinian order, and is of the highest interest, as similar remains are extremely rare, Essebourne is about a mile distant from Midhurst. The remains are considerable, as will be seen by the accompanying plan. Is there no Wiltshire antiquary who will give us one of Lacock Abbey, which Mr. Bowles could not explain ?

The refectory, on the south side of the cloister garth, is now a barn, and in a miserable state of confusion. On the south side three out of a range of four upper windows remain, over deeply-recessed square-headed windows ; the south wall retains a large window-case entirely blocked up ; in the north wall is a large pointed arch, with rich ornamentation, which formed the principal entrance on the south-west ; and a large round-headed arch possibly formed the covering for the lavatory. The site of the kitchen only is preserved. In the west wall of the dormitory four pointed arches, with good mouldings, probably formed carols. A door in the north wall of the cloisters admits the visitor into a small open court, at the end of which is the chapter-house, which has three lancets under a comprising arch in the east wall, and a noble pointed arch of large dimensions on the west. A few corbels are fixed against the south wall of the chancel. Probably they carried a gallery, which must have been built in accordance with the following order :—In 1521 the Prioress, Joanna Sackville, was required to repair the cloisters and houses and to make "closure windows" (*clausuras fenestras*) in the church, on the east side between the chapel of the priory and the church." They had their own chaplain. In 1529, Sir David Owen required a "new stage choir to be built over the old choir, under such form as the nuns may come from their dortor in the Great Chamber, and from thence into the choir, and nobody to see them ; the said choir to be of timber, and the old choir to be taken away, and belfry ; and it is to be used as parcel of the church, with a partition to be made, so that none may come out of the church to the high altar in the chancel of the said priory." At the west end of the court a door admits into the nuns' choir ; and in the upper part of its south wall are four Late Perpendicular lights, which opened into Owen's upper choir, which formed a sort of double chapel similar to those mentioned in my "Sacred Archæology." A single Early English pillar, with a scolloped capital, with a half pillar and arch, divide the chapel from the church, and the intervening space was filled with a grille or carol, lattice work, called by the bishop, in his injunction, "closure windows" ; thus secluding the nuns from sight of the congregation.



At the east end of the chancel over the altar are three lancets, with a small round. Probably the west wall was similarly arranged, as the round remains over a three-light Perpendicular window. The north east window is a large lancet ; near it is a cinquefoiled arch, probably that of the founder, Sir John Bohun, but now occupied by an effigy of Sir David Owen, of the Tudor period. There is a north porch.

There are no remains of the base court or gate-house.

HARDHAM PRIORY OF AUSTIN CANONS.

This Priory is about a mile from Pulborough, and now forms a part of Mr. Challen's farm buildings. The remains include the cellarage of the refectory and the chapter-house, which retains three pointed windows at the east end, a north-east and south-east window, and the west front, consisting of three arches of equal height, having dog-tooth mouldings ; formerly a small cruciform ornament pierced their heads. The guide-books speak slightingly of these ruins, but they are nevertheless well worthy of a visit by the antiquary and artist.

NEWARK OR ALDEBURY.

The ruins of this Priory are situated at a distance of about two miles from Woking, close to the banks of a small stream. A little further to the south, on another branch of the river, is the old Priory Mill. The Priory was founded, it is believed, in the time of Richard I. The site was given to that sacrilegious glutton, Sir Anthony Browne. The remains include the presbytery, choir, south wing of the transept, part of the south nave, aisle, portions of a north chapel, and the south wall of the slype, forming one side of the chapter house.

The eastern limb had a groined vaulting, and (we may add with every probability) so had the central space over the crossing, which forms the most remarkable feature in the building. The choir was arranged in it, and completely shut off by walls from either wing of the transept, but in order to obviate the gloom and bareness produced by such an arrangement they pierced there solid screens above the level of the stall work, with two large Pointed windows on each side. From the entrance of the crossing to the extreme east end measures about 84ft., and as the internal width is only 20ft., and the vaulting was lofty, an effect of extraordinary height must have have been produced.

In Buck's view (ii. 282), the west gable wall, and part of the east wall of the refectory on the south side of the cloister garth, a considerable portion of the chapter house walls, and the eastern doorway of the slype, are delineated, together with the weather moulding of the dormitory gable, and a window below it. The south choir aisle was completely separated from the sacristy, and vaulted.

The choir aisles were 14ft. wide, and two low doors opened into them on either side ; above these were tall pointed windows, very deeply splayed at the base, where the pitch of the aisle roof abutted against them. A sacristy on the south and on the north a chapel approached by its own door in the west wall, ad-joined each aisle, and was accessible from the transept. The single window on each side of the presbytery is of its natural dimensions. The south wing of the transept is perfect on the east and west sides, there are three perfect windows in the clerestory; the south-east window has a curious sub-window inserted in the lower part, which lighted the sacristy roof. The gable has a large pointed window, and the bare wall beneath shows that lofty buildings —no doubt the dormitory—abutted upon it.

---

* "Brick and Marble Architecture in Italy." G. E. Street, F.R.I.B.A. 1855.

The fragment of the nave is of great interest; over a pointed door opening into a narrow aisle, 9ft. wide, is a very large window in the position of a triforium, and above it are the jambs of a clerestory light. The weather mouldings show the pitches of the various lean-to roofs.

There is but an insignificant amount of ashlar left. The walls have been completely peeled, and deep fissures show that rapid decay has set in, so that large falls may shortly be expected even in the wreck of this once beautiful building.

On the north side flows a little river, and at some distance is the Canon's Mill on the south, standing upon a stream abounding in trout and pike.

Mackenzie C. E. Walcott, B.D., F.S.A.

◆

ADULTERATION OF PAINTS.

By Professor Henry E. Colton.

It has been said that this is an age of adulteration. This may or may not the true. When prices are high those articles whose nature permits the frauds will be adulterated, but there is a point in the decrease of prices where adulteration cannot be done with profit, taking into view, first, the cost of the article of adulteration; second, the deterioration in the article adulterated; and the at least constructive damage to the adulterator if detected.

Almost the only adulteration of paints is sulphate of baryta, commonly called barytes. The oxide of zinc is frequently put into white lead, but it is questionable whether it is not an improvement rather than an injury. The commercial article, "barytes," is a sulphate of the alkali baryta, which has as a base the metal barium. It is insoluble in water and the weak acids, and but sparingly soluble in the most concentrated acids. Its specific gravity is about 4·84, being the heaviest known mineral, hence its common name among miners is heavy spar.

It is chiefly produced in the State that gave us the wooden nutmeg, and goes by the cant name of "Connecticut Lead." It is abundant in Virginia, North Carolina, Missouri, Georgia, and New Jersey. The best article now produced comes from Missouri. It usually accompanies lead ore; varies in colour from a milky to a clear white, and can easily be told by its great weight and crystalline structure. Its value depends upon its freedom from specks of iron, copper, or lead ore.

To prepare it for market the ore is cracked into pieces about the size of buck shot. These are then agitated in dilute sulphuric acid to dissolve the copper and iron, then washed with water, again treated with acid, then washed repeatedly with water, dried, and ground perfectly fine, after which it passes through a number of bolting cloths and is ready for market. Lead specks are more difficult of extraction. If not very numerous no effort is made to take them out, but if desirable to do so, the cracked ore is treated with strong hydrochloric acid, and sometimes with lime. Some manufacturers do what is called "floating," that is, after grinding the rock to flour dust it is run through a series of vats, water passing through them, and constant agitation being carried on. The lighter impurities pass off, and nearly perfectly pure sulphate of baryta precipitates. The impurities of the ore other than above mentioned are silica, carbonate of lime, and sometimes a little sulphate of strontia. The article differs very much in colour and fineness as put on the market; that from St. Louis has, just now, the highest reputation, it is in fact less crystalline in structure than any other—partaking somewhat of the fibrous nature of strontia.

The present product is about 20,000 tons per annum, but it is estimated that in 1865-6 fully 40,000 tons were imported into and produced in the United States. At that time the price per ton ran as high as 90 dols., now it is 35 and 40 dols. The imported article comes from Nova Scotia, Germany, and England. The profits of its production and manufacture have been very large; but it is doubtful if it can be produced with profit for much less than 30 dols. per ton.

We have been thus implicit with this article because of its whole product fully four-fifths enter into the adulteration of paints. Its other uses are for the adulteration of other articles, even medicines. We believe its only good use is as a substitute for white lead in enamelling paper collars. As an adulteration of paints it adds to the weight and injures the quality. The paints containing it are better than whitewash just in the proportion that they have a larger percentage of lead or zinc in them. Some are the merest shams, others have 75 and 80 per cent. of lead and zinc, and are proportionably valuable. Some of the latter have attained great reputation, especially when ground in a peculiarly refined oil, which contains some of the acids used in its refining. No person need be fooled by an adulterated paint. If he buys it, it is simply his own fault. If he desires cheapness more than durability and purity, he gets it. Every one knows when he buys a coat below the cost of the wool in it, and the labour on it that he is getting shoddy. Metal lead, for instance, is 8 cents per pound (gold); white lead, then, would likely be about 12 cents per pound (currency), ground in oil. Hence, if a man buys a paint at 8 cents, he should have sense enough to know he does not get a pure white lead. It is further the custom of manufacturers never to put their names with the words "Warranted Pure," on adulterated brands. The latter or the former may be on, but never both together. Besides, no respectable firm ever sells a customer an adulterated paint if he asks for the pure and is willing to pay its price.

HOW CAN THE ADULTERATION BE DETECTED?

In a late statement of how to analyse white lead in oil, published in the *Scientific American*, it was recommended to dissolve out the oil with spirits of turpentine. This is next to an impossibility, as that article is not sufficiently volatile, has itself somewhat of an oily nature, and some of the particles of the pigment will remain coated with oil, and not dissolve in the after process, hence creating an idea of impurity when the paint may be actually pure. Our experience has been large, and we prefer bisulphide of carbon to all other solvents of oil. It evaporates freely, takes less of it to do the work, and leaves the pigment cleaner; nearly as good is high gravity gasoline, say 80°. It is our custom to agitate the paint in the liquid, allow it to settle, and draw off. Place the pigment on a funnel, filter, and triturate again and again with the solvent. Then dry the pigment on a sand bath, wash with water and redry. Any one can easily tell from its look and feel if he has extracted all the oil. Perfect dryness and perfect freedom from oil is absolutely necessary. Dissolve the dry pigment thus obtained in dilute nitric acid. Strong nitric acid will not dissolve white lead; it must be diluted with four or five times its volume in water, perhaps more. The operation is accompanied with the evolution of carbonic acid gas. If all is dissolved it is pure lead or zinc—either oxides or carbonates. If there is residuum after repeated trials, with more or less dilute acid, it shows presence of an adulteration—most likely barytes, perhaps sulphate of lead. Take this and boil in hydrochloric acid; if it dissolves it is not barytes. If dissolved, pour into the solution a little hydro-sulphuret of ammonium; a black precipitate shows that you have sulphate of lead. If there is no precipitate, put in a little dissolved oxalic acid; a white precipitate shows lime. The sulphate of lead is seldom or never used as an adulterant in this country, the sulphate of lime never in paint. For zinc, pour into the nitric acid solution sulphuric acid, the lead will precipitate as sulphate; then into the liquid pour a little hydro-sulphuret of ammonium; a white precipitate will show zinc. There is, however, in the market a pigment containing a sulphate of lead, not crystalline in structure, and perfectly soluble in dilute acids. It is made by sublimation.

Whiting and terra alba are seldom or never used as adulterants for any white paint, They are too light, and turn dark in oil. Some colours, however, have terra alba as a base. The process indicated, if conducted with care, will give a perfect result. The main point is to get the oil out entirely; and with all due respect we assure our friends of the *Scientific American* that it cannot be done with spirits of turpentine.

There is just now coming into practice another species of adulteration which for worthlessness bids fair to eclipse the baryta paints. This is the use of water instead of the full quantity of oil or spirits of turpentine. A paint is valuable and durable just as it has the proper quantity of pure oil in it. This new adulteration is thus accomplished The soluble salts of the metal and alkalies dissolved in water and mixed with oil forms a sort of soap, add to this a pigment and it will mix and be held in solution. Small quantities of spirits of turpentine or benzine are added. To such an extent can this be carried that in some of the paint sold "Mixed ready for use," fully one-half is water. Their worthlessness for work exposed to the weather is evident. There are paints thus sold, however, which are properly mixed.

[Notwithstanding our correspondent's criticism, we insist that very good results may be obtained by proceeding as we directed in the article to which he refers. He seems to have overlooked the subsequent washing with alcohol, after the spirits of turpentine have been used to remove the bulk of the oil. Alcohol dissolves both linseed oil and turpentine, and by its use the solid substances contained in the mixture may be rendered sufficiently clear for subsequent treatment, if the oil is pure linseed, as we can vouch from experience. If the linseed oil used is adulterated with fish oil, rape-seed or cotton-seed oil, other solvents must, of course, be used. In that case ether or the solvents he names are better. The bisulphide of carbon, or ether, is not, however, available to painters generally. Benzine and gasoline are, however, good solvents, and may be advantageously substituted for the turpentine. Turpentine and alcohol are, however, to be found in all painters' shops. If the alcohol be heated to boiling, it will be more effective than when used cold, and less will be required.—Eds. of *Scientific American*.]

◆

ARCHÆOLOGICAL.

Somersetshire Archæological Society.—The annual meeting of the Somersetshire Archæological Society will be held at Wincanton, under the presidency of Sir William Medlycott, on the 23rd of August and two following days.

Kent Archæological Society.—A temporary museum of antiquities and objects illustrative of the archæology of the neighbourhood of Sittingbourne will be formed for the Congress of the Kent Archæological Society, which will take place in that town on the 3rd and 4th of August. Any person possessing such articles will oblige by sending them to Dr. Grayling, who has consented to undertake the arrangement of the museum, on or before the 2nd of August.

Charles Dickens an Archæologist.—At the time when "Pickwick" appeared, says a contemporary, antiquarian pursuits were despised by the general public, and the famous excursion to Cobham, where the inscribed stone was discovered, was written to ridicule them. Five and twenty years after, however, archæology found itself raised into the dignity of a science, and numbering among its votaries no less a person than the author of "Pickwick" himself. And at Cobham, too! This was in the year 1864, when the Archæological Institute met at Rochester. Dickens was on the committee, and an excursion, we find, was organised to Cobham. Whether another stone with Bill Stumps + His Mark, was discovered on that occasion we do not know, but it must have been very agreeable to the ladies and gentlemen present to have among them, whilst one of the party was deciphering a puzzling inscription, the author of the burlesque description of a scene which could not fail to recall to all who had read "Pickwick" that then before them.

◆

Inflammability of Rotten Wood Dust.—Dry wood dust blown into a candle gives a clearer and more intense flame than resin, and the wick becomes covered with a resinous crust, so that the burning of the candle is greatly retarded. As this kind of dust when coming in contact with a candle takes fire, it is unsafe to conduct manufactures in which it plays a part at night, when a light is required, and it is equally dangerous to strike a match. It appears that an accident occurred in a factory in Silesia where wood dust was employed, by which five workmen were fatally injured.

Building Intelligence.

CHURCHES AND CHAPELS.

Bloxworth.—Bloxworth Church, Dorsetshire, was re-opened on the 7th inst., the chancel having been entirely rebuilt at the expense of the rector, the Rev. O. P. Cambridge. The church, which is dedicated to S. Andrew, is of very great age. Originally a small Norman structure, it was enlarged and restored in the Early English period, and subsequently restored in Decorated times. The chancel has been restored in a substantial manner in its original Early Decoraed style. The exterior of the walls is of flint and stonework, the doorways and windows being of Doulting stone. The roof is open-timbered, having curved ribs springing from carved stone corbels; the ceiling is divided into panels by ribs, with carved bosses at the intersections, those over the sacrarium enriched by gilding and colour, and a quatrefoil ornament completing the cornice at the spring of the roof. On either side, dividing the nave and chancel, is an archway of Bath stone, of great depth and boldness, and having on each side a column of polished Irish marble, crowned with a carved stone capital. The eastern wall under the window sill is faced with Maw's encaustic tiles in a rich pattern. The east window is filled with stained glass by Heaton, Butler, and Bayne. Mr. George Evans, of Wimborne, gave his services gratuitously as architect, Mr. A. Green, of Blandford, being the builder.

Building and Enlarging of Churches and Chapels.—The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels, held its last meeting for the present session and until November, on Monday, at the Society's House, No. 7, Whitehall, S.W. Grants of money were made in aid of the following objects:—Building new churches at Bishopwearmouth, S. Peter, Durham; Deptford, S. Luke, Kent; Haggerston, S. Stephen, Middlesex; New Osney, in the parish of S. Thomas, Oxford; Tyndall's Park, S. Mary, near Clifton; Wyke, near Winchester. Rebuilding the churches at Builth, Brecon; Burton-Pedwardine, near Sleaford, Lincoln; Coleford, Gloucester; Haslemere, Surrey; Llanychaer, near Fishguard, Cardigan; Neenton, near Bridgnorth, Salop; Northam, Christ Church, in the parish of Southampton, and Uzmaston, near Haverfordwest; Enlarging or otherwise increasing the accommodation in the churches at Bosbury, near Ledbury, Hereford; Burford, Oxon; Chillingden, near Wingham, Kent; Cold Waltham, near Petworth, Sussex; Coningsby, near Boston, Lincoln: Frampton-on-Severn, near Stonehouse, Gloucester; Govilon, Christ Church, in the parish of Llanwenarth, near Abergavenny; Gunwalloe, near Helston, Cornwall; Holbeach, Lincoln; Litlington, near Royston, Cambridge; Llanarth, near new Quay, Cardigan; Stoke S. Mary, near Ipswich; Mottram-in-Longdendale, near Manchester; S. George's-in-the-East, London; Tisbury, Wilts; Watney-street, Christ Church, S. George's-in-the-East, London; and Widecombe, near Ashburton, Devon. Under very urgent circumstances, the grant formerly made towards reseating and restoring the church at Castlebigh, near Fishguard, Pembroke, was increased. The Society likewise accepted the trust of sums of money as repair funds for the churches at Llansaintfraed, near Conway, Denbigh; Westnewtown, S. Matthew's, Cumberland; Huddersfield, S. Andrew's; and Christ Church, Kensington, Liverpool. At this meeting it was unanimously resolved that, in the future consideration of grants to be made towards the building or restoration of churches, the accommodation which may be provided on chairs shall not be excluded from the claim.

Burton-on-Trent.—The trustees for the erection of a new Wesleyan chapel, Burton-on-Trent, have placed the work in the hands of Mr. George Lilley, contractor, Ashby-de-la-Zouch, the amount of the contract being £3365. The site for the new chapel is in Station street. The building is designed to accommodate 900 persons, and will be a Gothic building of brick, with stone dressings, having a tower and spire 120ft. high. Mr. E. Holmes, of Birmingham, who has recently completed two churches in the immediate neighbourhood, and also the new Burton-on-Trent Dispensary, is the architect employed.

Christ Church, South Hackney.—The foundation stone of this church will be laid on the 6th proximo, by Lord George Hamilton, M.P. The contract has been taken by Messrs. Axford and Whillier, at £4875, Mr. Wigginton being the architect.

Church of S. Luke, Evelyn Street, Deptford.—The foundation stone of a new church, to be dedicated to S. Luke, was laid on Tuesday, the 19th inst., by William John Evelyn, Esq., of Wotton House, Surrey, in the presence of the Bishop of Rochester, the clergy of the diocese, and a large concourse of spectators. The church is now being erected on a site which was given free of all charge, by Mr. Evelyn. It will accomodate 1010 persons seated on the ground floor; there are no galleries. The work has been taken by Messrs. Dove Brothers, of Islington, for £5287. The architect is Mr. Thomas Henry Watson, Nottingham-place, London. It will consist of nave and aisles, chancel, and chancel aisles, with a tower at the junction of nave and chancel. The materials used are Kentish rag stone with Bath stone dressings to doors and windows, &c., but not to the quoins, which are to be chisel-drafted. The walling is brought up at intervals to horizontal courses of long stones, and the colour is relieved by red tile bands laid as headers to break joint, 3 courses to each band, on top of the stretching courses of the rag stone. The style is 13th century Gothic, simply treated.

Cleator Moor.—The foundation stone of a new church at Cleator Moor, Cumberland, was laid on Monday last. The style of the edifice is Gothic, and sittings are to be provided for 600 persons. The church comprises a substantial tower about 30ft. square, nave, aisles, and chancel with aisles, that on one side being designed for an organ chamber, and the other arranged for a vestry. The total length of the church is about 130ft., and its width about 60ft. The character and scenery of the district required rather a simple and massive than an elaborately-decorated building, and this the architects have aimed at, and have produced their effect by good substantial work, thick walls, and simple mouldings. The external walls are full 3ft. to 3ft. 6ins. in thickness, while those of the arcade and clerestory are 4ft. thick. The main feature in the building is that all the roof is groined in brick. This is said to be the only instance of such treatment in modern church-building in the North of England. The whole of the interior of the building is lined with brick. The chancel is quadripartite, with moulded stone ribs. The nave is spanned by a single pointed arch, the arches of the clerestory windows being groined horizontally into it. The aisles are subdivided into bays by ribs of brickwork springing from stone corbels, whilst the tower, which is to be used as a baptistry, is again of quadripartite groining, with stone ribs. Adjoining the church will be an unpretentious but commodious parsonage. The total cost, exclusive of site, will be about £5000. Messrs. Cory and Ferguson, of Carlisle, are the architects, and Mr. Eilbeck, of Cleator Moor, is the contractor.

Moulton.—The Baptist chapel in this place, rendered interesting and noteworthy by the association with it of Dr. Carey, the celebrated Oriental linguist and missionary to India, was re-opened, after enlargement and restoration, on Thursday week. The chapel is a plain quadrangular structure, capable of seating about 300 persons. The building is of native stone, with brick dressings for the windows, the frames of which are of iron with circular head, and grained to represent oak. A porch at the south end, also of stone faced with brick, and having a sandstone coping, forms the chief entrance. The expense of the enlargement and restoration at Moulton was £300. Mr. Blunt, builder, of Pitsford, executed the work.

S. Barnabas, Grove-road, Bethnal-green.—This church, which was consecrated on the 2nd inst., consists of nave (56ft. high to the ridge), north and south aisles, and chancel, with organ chamber and vestry on the north side and spacious baptistry on the south; but the orientation is not strictly correct, the site not permitting it. There is an entrance at the west end of the north aisle, but the principal one is under the tower, which stands out from the church at the south-west angle, and, with the spire, forms a prominent object at the junction of Esmond and Grove roads. The style is Middle Pointed Gothic, freely treated, and the materials brick and stone, the interior being rather elaborately decorated with coloured bricks. The font is very handsome, and the fittings good. The church which seats about 900, and cost under £4000, was built from a design by Mr. W. Wigginton, F.R.I.B.A., architect.

Sarusfield.—The church of S. Mary, Sarusfield, Hereford, was re-opened after restoration on Thursday week. The fabric consists of nave and south aisle, chancel, sacristy, west tower, and south porch. Previous to the restoration there was no sacristy, that and the actual chancel being all one, making an ill-proportioned and inconvenient arrangement. The roofs, walls, and other features were plastered up and admirably whitewashed, in the usual style of the Churchwarden age. The work of restoration has been to remove the modern lath and plaster flat ceilings and whitewash, &c., throughout; to rake out and point the stone work; and to take down and rebuild the shattered south wall of the sacristy. The work has been substantially executed by Mr. John Walker, builder, of Hereford, in accordance with the drawings and specifications prepared by and under the supervision of Mr. George Cowley Haddon, architect, of Hereford and Great Malvern.

Stepney.—The Ecclesiastical Commissioners have instructed their architect, Mr. Ewan Christian, to prepare plans immediately for the new church of S. Benet, Stepney. The site is in the Mile-end-road, between the almshouses of Bancroft's Hospital and the Jewish burial-ground. The church is to be erected and endowed out of the funds arising from the sale of the site and fabric of the church of S. Benet, Gracechurch-street, at the corner of Fenchurch-street, which was pulled down two or three years ago to widen the thoroughfare.

Yarmouth.—On Tuesday week the new Congregational chapel in Gaol-street, Yarmouth, was formally opened. The style of architecture is Gothic, and sittings are provided for 700 persons. The chapel consists of transept and nave. There are no side galleries, but the roofs over the side aisles are much lower than that covering the central portion of the building. The cost has been about £3500.

Youlgreave.—The parish church of Youlgreave, Derbyshire, was re-opened on Wednesday week, after restoration under the direction of Mr. Norman Shaw, F.S.A., of London. The church consists of a massive tower at the west end, a nave with clerestory, north and south side aisles, and a chancel. The tower is Perpendicular, and it and the roof of the church appear to be of about Henry VII.'s time, but the other parts of the church are considerably earlier in date. The south aisle is Norman, whilst the north aisle and the main part of the church are Early English. At the east end of the south aisle a part of the bottom of the wall is of rude unsquared stones, rounded in form, and tradition points to this as having formed part of a previous Saxon church. In the restoration, all the decayed rafters in the nave and aisle roofs have been replaced, and the chancel roof has been almost entirely renewed; and this roof has also been raised, for, before the restoration, it was 6in. below the top of chancel arch. A new five-light Perpendicular window has been placed in the east end, and the floor of the chancel paved with Minton's tiles. A new reredos of alabaster, with columns and capitals of dark-coloured marble, has also been provided. There was an old oak rood-screen between the nave and chancel, and it is hoped that it may be so far restored as to be replaced. The old seats in the nave have been restored, and additional ones of the same pattern constructed. All the walls have been cleared of the accumulated whitewash of ages. A peal of eight bells, by Mears and Stainbank, has been hung in the tower. The work of restoration has been carried out by Messrs. Pearson Bros., of Leeds, and the hot-air apparatus is by Haden, of Trowbridge. The chancel, which has been restored at the sole charge of the Duke of Devonshire, has cost about 1100*l*., and the general work will amount to about 3000*l* more. Mr. Norman Shaw, the architect, has scrupulously preserved or restored all the characteristic features of the church.

BUILDINGS.

Clerkenwell.—At a meeting of the Middlesex magistrates last week, a report was brought up from the visiting justices of the House of Detention, Clerkenwell, with respect to the proposal to enlarge the building. The report (which was adopted) stated that since the 24th of February last, when the court determined that an enlargement was necessary, and directed the clerk of the peace to serve the necessary notices for the acquisition of the lands and houses required for the purpose, and to submit plans to the Secretary of State for approval, every exertion has been made to carry out the wishes of the court. After the approval of the Home Secretary had been obtained for the plans, working drawings and specifications were prepared, and tenders for the erection of the additional buildings had been procured. The visiting justices now accepted the tender of Mr. W. Henshaw for performing the work, at a cost of £10,685, which was the lowest of ten tenders obtained from different firms, varying from £13,250, down to the amount mentioned in the proposal which had been accepted. The total outlay which would be necessary was £44,660, which was made up of £30,970 for land, £10,685 for building, and £3000 for architect's commission, legal, and other expenses.

Lambeth.—A preliminary prospectus has been issued of a proposed new company, under the title of the Royal Victoria Palace Company, with a capital of £50,000, having for its object the purchase of the lease, properties, &c., of the well-known Victoria Theatre, in the Waterloo-road, and converting it into a large music hall. The cost of the necessary alterations and decorations is said to be estimated by "an experienced architect" at £10,000.

New Theatre, Dublin.—The Lord Lieutenant having granted a patent for the erection of a new theatre at the top of Grafton-street, Dublin, the promoters have commissioned Mr. C. J. Phipps, F.S A., of London, to prepare plans.

St. George's-in-the-East.—The foundation stone of a new infirmary for the poor of St. George's-in-the-East was laid on Tuesday week by Mr. Fraser, Chairman of the Board of Guardians. The new building is to be erected on the site of a number of small houses adjacent to the workhouse, on the side nearest the river, and is intended to accommodate 300 of the sick poor of the parish. Mr. A. Wilson is the architect, and Mr. Ennor, of S. George's-in-the-East, is the builder. The cost will be £27,500.

Sunderland.—Extensive new ironworks on the Hylton Castle estate were commenced eight weeks since, and are now assuming a tangible shape. A tall chimney-stack, which is to reach the ultimate height of 200ft., is rearing its form on the river bank, just below the Dene farmhouse. Occupying an extensive area around the stack are masses of solid masonry, of brick and concrete, to form beds for the ponderous machinery which will be employed in the new works, and nearer the river bricks are being manufactured from a bed of clay. The cost of the new works and plant, when completed, will be about £100,000, and it is probable that ultimately employment will be afforded 1800 ironworkers. This will involve the settlement of a large population, and the creation of a new town round the works. Already, in a field to the west, a commencement has been made with houses for the manager and foreman, and seventy workmen's cottages.

The Moberly Library at Winchester.—The School Library, which has been built by subscription among Wykehamists as a memorial of the Bishop of Salisbury's Head-Mastership, is now nearly completed, and the ceremony is fixed for the afternoon of Domum Day, Tuesday, July 26, when the Bishop of Salisbury, Sir William Erle, the chairman, and other members of the committee, are expected to be present; and it is hoped there may be a large gathering of the Wykehamists. The new Moberly Library is a handsome room, 86ft. long, 21ft. wide, with deep bay windows, and 23ft. high, and will be a great addition to the school buildings. Mr. Butterfield is the architect.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

Received.—C. R.—S. H.—C. B. A.—M. C. and Co.—A. R. and Co.—T. G.—T. C. M.—J. T. W.—J. M.—T. N.—Rev H. H.—J. M.—W. R. T.—T. B. H.—W. H.—W. and S.

M. Carpentier (Bœiœil).—All the numbers have been forwarded. We are gratified by the receipt of your kind letter, and should be very glad indeed to hear from you on the subjects you name. The writer of the articles on the Exhibition of 1867 is gratified by your approval of his criticisms. All designs you may send will be carefully examined, and returned if not used.

J. Langham.—In all probability.

B. J. T.—The Sketch Book will consist of about 50 plates.

W. J. C.—It will all depend on the character of the draw-

Correspondence.

PATENT VICTORIA STONE.

(To the Editor of The Building News.)

Sir,—Be good enough to allow us a very short space in answer to Mr. Trickett. 1. As Mr. Trickett says he did not make the prophecy in question, we presume there was some mistake in the matter; but we had no reason to doubt our information. 2. Our stone is made to suit specially the various purposes for which it is required; our pavement with a view to hardness; lintels, girders, &c., with a view to transverse strength. Our challenge was to compare flagging in hardness, and a beam in transverse strength.

If Mr. Tricket prefers a landing to a beam, let him name the size. We only stipulate that our landing shall be allowed six months for seasoning.—I am, Sir, &c.,

The Manager, Victoria Stone Co.

BUILDERS MAKING PLANS.

Sir,—Your correspondent ("An Old Subscriber") would not be so much surprised at builders preferring to work from their own plans to working for some architects if he had a little experience as a builder. There are architects who abstract as much money as they can from the builders, besides harassing them in all manner of ways; and I have many times heard builders tell with impunity how they can buy certificates after their work has been condemned. If builders are expected to be honest and honourable, architects should be honest and honourable too. There are many architects who cannot get builders to have anything to do with them; and there are many first-class architects (and honest) who can command the most respectable builders. The risk and responsibility of builders on contract work are so great that the sympathy of the architects should be with them instead of against, as it often is when their work is honest and good. Of course no architects can have any sympathy with scamping builders. It is therefore not to be surprised at that builders are shunning architects' contracts. Let architects wash their own hands and be honest before they complain of builders.—I am, Sir, &c.,

July 18, 1870. Builder.

PRICES OF TIMBER AT SALES.

Sir,—We write in order to inform you that in our opinion the quotation of prices realised at the public sales of Churchill and Sim, &c., are calculated to be very detrimental to the interests of timber merchants generally, as even if the quotations were correct, they would be very misleading at the best of times; but when they are altogether fallacious—as they always are—the evil is even greater. In corroboration, we call your attention to the report in this week's number:—

	£	s.		£	s.
1st Christiana	11	10	instead of	19	5
1st and 2nd Gefle	10	0	,,	12	0
3rds ,, ...	9	10	,,	10	0
1st and 2nd Husum	9	10	,,	11	0
3rds ,, ...	8	10	,,	9	10
4th Gefle....................	8	0	,,	9	0
1st and 2nd Soderham ...	8	0	,,	10	15

&c., &c.

The above represents the difference between your report and what the deals were absolutely knocked down at—mind, not the price at which they were sold; for in many cases the buyer would have to give Churchill and Sim a considerable advance on the bought-in prices.—I am, Sir, &c.,

J. A. Rosling.

Timber Wharf Sawing and Planing Mills, Southwark Bridge, Bankside, S.E., 16th July, 1870.

"THE PERPLEXITIES OF BUILDING."

Sir,—Mr. Burden arrogantly questions the accuracy of the statements contained in the paragraph under this head, which appeared in The Building News for July 1; but can he deny that the differences which have arisen between himself and the contractor have kept the Islington Guardians waiting a long time for their new workhouse? If not, he has no ground of complaint against you for reproducing from a local paper the paragraph in question. I see that the Guardians have determined to take vigorous action in the matter, and if they do not succeed in bringing about a friendly feeling between architect and builder, I hope they will, for the sake of the ratepayers and the poor of the parish, manage to get their new workhouse at Holloway completed.—I am, Sir, &c.,

Note-taker.

SHREWSBURY MARKET BUILDINGS.

Sir,—A paragraph in your issue of July 1st, headed "Certifying for Extras," referred to a meeting of the Shrewsbury Town Council, in which it was stated that I declined to furnish particulars of the extra works at the markets.

In reply, I beg to say I delivered a detailed account of seventy-two pages, giving totals of each item, which was returned to me to fill in the prices. This I declined to do until I had laid the matter before the Royal Institute of British Architects, and obtained their opinion thereon, and the following is an extract from the secretary's letter on the subject:—

"The Professional Practice Committee consider that you were quite justified by professional custom in declining to price out each detail in the account, and they are also of opinion that in supplying the details themselves it was unusual and needless to specify them with such minuteness."

As to the amount of extras, stated by you to be of the enormous sum of £11,846. This was without giving credit for variations and omissions; the amount of cash paid to the builder being £22,271 14s. 10d., and his contracts £16,976, leaving the sum of £5,295 14s. 10d. as the extra amount, and of this sum nearly £4000 was spent by direction of the committee in additional vaulting under the markets and the great depth of the foundations, and nearly £1000 on the fixtures.

In my last letter to the town clerk I stated my willingness to submit the whole of the building to be measured and priced out according to the schedule by some independent surveyor mutually agreed upon, or by one on each side, with power to call in an umpire, and if the amount agreed at by this course be less than my award, to refund the amount, and pay all costs; if, on the other hand, it was greater, the committee would undertake to pay me the excess.—I am, Sir, yours &c.,

Robt. Griffiths.

Stafford, July 18, 1870.

ARCHITECTS' PUPILS.

Sir,—Some time since there appeared a series of replies to questions propounded in your "Intercommunication Column," with regard to the duties of an architect's pupil, and although it be a vexed and painful subject, I would fain extend it, touching more particularly on the injustice practised by architects towards their pupils. Accidentally turning to an article in the *Builder* of August, 1843, on the "Remuneration of Architectural Draughtsmen," the writer, after pointing out the talent and education necessary in order to become a neat and expeditious draughtsman, positively states that they are the worst-paid class of men of the whole body of clerks. And as then, so now, we have to mourn over the same, and even a worse state of affairs. Let us, then, try to investigate the reason, by tracing it to its first cause—and we have not far to look around us in order to explain this somewhat startling fact, for a superficial observer would at once see that it is mainly owing to that wholesale system of taking pupils which causes our assistants to be so badly paid, and fills the advertising columns of The Building News week after week, with "Situations Wanted." This system of pupil-taking is growing worse and worse, and it is high time something was done to check it, for the manner in which many architects make it a practice of augmenting their purses by taking pupil after pupil to serve them for a term of three, four, or five years, as the case may be, and after that dispensing with them, in order to make room for more, is not only ruinous to the profession, but a scandal to it, and cannot be too strongly reprobated. A solicitor, no matter how extensive his practice, can only be possessed of two articled clerks at a time, and why should an architect enjoy a greater privilege? I maintain, moreover, that when there are three or four pupils in an office where there ought only to be one, all must nevitably suffer, for someone must, and in some instances the whole, act in the treble capacity of pupil, clerk, and errand-boy. And then there is a great deal of disinterestedness and indifferentism on the part of the master with regard to his pupils; he cares little or nothing as to their future welfare, whether they become competent as assistants after having served their articles, or no; he takes little or no trouble to teach them anything, unless he be necessitated to do so in order to carry out something he cannot attend to himself; and the clause inserted in every pupil's articles, binding his master to do his best to teach him the profession in all its branches, is entirely ignored and nullified. I fear we must despair of reform until architecture be made more entirely a profession, and until some restriction be brought to bear upon the architect, for, as the writer before alluded to observes :—"Architects will not give high salaries to assistants as long as they can fill their offices with pupils who pay them large premiums for being there." It has been argued that if there are *ona fide* grounds for complaint the pupil should seek for redress by an action at law for damages for breach of contract, but this is not only an unpleasant way of proceeding, but it is a doubtful way, for it is a critical thing to legislate between master and pupil. I admit that it depends in a great measure upon the pupil himself as to whether he will become master of his profession, for in these days of competition between architects' pupils and skilled artisans who have every facility for obtaining a knowledge of drawing, it is not only necessary that he should have a thorough training from his master, but that he should study hard himself in order that he may keep pace with his fellow competitors.

Pardon me for encroaching so far on your valuable space, Sir, but I feel this to be a momentous subject, and have offered these observations with the hope that the matter may be further agitated, and that they may in some slight measure tend to bring about that "architectural millennium" so devoutely to be wished for.—I am yours, &c.

AN INJURED PUPIL.

ARCHITECTURAL ASSOCIATION EXCURSION.

SIR,—In reference to a paragraph you inserted last week on the proposed excursion to Lincoln, may I ask you kindly to insert the following alterations which have since been made in the programme, by which greater advantages will be gained for those attending, and the expenses of the excursion diminished?

I shall be glad to forward further particulars to any one who purposes attending.—I am, yours truly,

JOHN S. QUILTER, Hon. Sec.
9, Conduit-street, W., July 20.

The members will assemble at Lincoln on Monday, Aug. 22nd, and the first meeting will be held in the Assembly rooms at two o'clock, when Mr. Sharpe will deliver his introductory lecture on Lincoln Cathedral. The remainder of that and the whole of the following day will be devoted to the examination of the Cathedral and other buildings in Lincoln, and a meeting held in the evening at the Assembly rooms. Divine service is held in the Cathedral at 10 a.m. and 4 p.m. On Wednesday, August 24th, there will be an excursion along the Cliff-road to the south of Lincoln, and visits paid to Caythorpe, Fulbeck, Leadenham, Wellbourn, Wellingore, Navenby, Coleby, Harmstone, Waddington, S. Mary Wigford, and S. Peter's Gowts, returning to Lincoln. On Thursday, August 25th, there will be an excursion from Lincoln to Sleaford, and the following churches will be visited:—Silk Willoughby, Osburnby, Threckingham, Billingborough, Horbling, Swayton, Holpringham, Heckington, and proceeding to Boston. On Friday, August 26th, an excursion will be made from Boston to Spalding and Sutton visiting Gedney, Fleet, Holbeach, Whaplode, Weston, and returning to Spalding. On Saturday, August 27th, the party will proceed from Spalding to Peterborough, when the Cathedral will be visited, its architectural history described by Mr. Sharpe, and a meeting will be held at Peterborough on Saturday afternoon, which will conclude the excursion. Arrangements are being made for the board and lodging of members coming from a distance, and for their conveyance to and from the churches to be visited, particulars of which will be forwarded to all those who give timely notice of their wish to avail themselves of the opportunity. It is expected that the expenses for the week, exclusive of the railway fares, will not exceed £3. Members attending the whole, or any of the different meetings and excursions, are requested to give notice of their intention either to the Honorary Secretaries of the Architectural Association, No 9, Conduit-street, London, W., or to the Rev. G. T. Hervey, Honorary Secretary of the Lincolnshire Diocesan Society, on or before Monday, August 15th. J. S. Q.

THE CORN EXCHANGE COMPETITION.

SIR,—In your notice of the awards made in the recent competition for the re-building of the Corn Exchange, Mark-lane, by some mistake the proper order of our names was reversed. May I ask you to state that the award of the second premium, has been made to the design marked "Progress," the joint production of Robert Hesketh and Thomas Henry Watson—*seniores priors*. I am, Sir, &c.,

THOMAS HENRY WATSON,
9, Nottingham-place, W., London, July 18, 1870.

Intercommunication.

QUESTIONS.

[1900.]—STONE DUST IN MORTAR.—In a work I am carrying out, I have suspicions that the builder puts stone dust into the mortar with the lime; the lime is, I believe, pure when brought on to the ground, but the stone dust is added when it is made into mortar. The mortar is not so tough as I think it should be. Can any one inform me how I can detect stone dust in mortar, either by analysing or otherwise?—G. J. C. C.

[1901.]—ARCHITECTURAL PERSPECTIVE.—Can some one recommend me a good book on architectural perspective—*i.e.*, perspective taken from plan and elevation?—G. A. MOORE.

STATUES, MEMORIALS, &c.

MUCH WENLOCK.—A monumental cross has just been erected in the new burial ground at Much Wenlock, to the late Mrs. M. Gaskell. The base is a large square of polished Aberdeen granite; above this is a square of polished black serpentine, the two being 6ft. high. Then comes the base of the cross—a square with four inscriptions—with a centre square rising 8ft. from the cross. The whole of the work was executed by Mr. Wright, of Pimlico, from a design by Mr. Polgrave, of London.

NEW CROSS FOR THE ROCK OF CASHEL.—Messrs. Earley and Powells, of the Camden-street works, Dublin, have just completed a fine piece of art work. It consists of a large cross to be erected on "The O'Scolaidhe Monument, St. Patrick's Rock, Cashel," and stands about 26ft. in height above inscription stone on monument. The cross, with its shaft and pedestal, is of Portland stone, specially selected from the quarries. The shaft at its base is 2ft. 8in. by 2ft., diminishing upwards to 2ft. by 1ft. 8in. under the arms, the extreme width of which is 7ft.

WATER SUPPLY AND SANITARY MATTERS.

RETFORD.—We are informed on official authority that on Monday next (the 25th inst) Arnold Taylor, Esq., will hold a Government inquiry into the sanitary state of four parishes of East Retford, West Retford, Ordsall, and Clarborough, comprising the town of Retford.

BRENTWOOD.—A memorial having been sent to the Secretary of State by some of the inhabitants of Brentwood, alleging that the Vestry refused to carry out all or any of the recommendations made in the report of Mr. Arnold Taylor, the inspector, with respect to the water supply and carrying out a system of sewerage for the hamlet, a letter has been received, asking that the Vestry will inform the Secretary of State whether the allegations contained in the memorial are true, and, if so, that they will show cause why an order should not forthwith be issued, under the 49th section of the Sanitary Act of 1866, limiting a time for them to set about the performance of their duties as regards water supply and drainage. The letter concludes thus: "Unless within two weeks from the date of this letter (July 8), you show cause accordingly, the order will be issued without further notice."

AYLESBURY SEWAGE.—At the last meeting ot the Aylesbury Local Board of Health the chairman read the report of a committee appointed some few weeks ago to inquire into the best mode of disposing of the town sewage. The report stated that the committee had visited Bedford, Romford, Leamington, and Warwick in the pursuit of their inquiries. At Bedford, Romford and Warwick, the sewage is disposed of by means of irrigation; at Leamington, the A B C process is at work, but about to be abandoned in favour of irrigation. The committee is of opinion that the A B C system is not a success, and say they had occular demonstration that the noxious matter had only been partially removed from the effluent water, which still fouled the bed and banks of the river; they therefore unhesitatingly recommend the disposal of the sewage of the Aylesbury district by means of irrigation, leaving it to the Board to determine the mode and direction in which this principle shall be carried out. From information obtained during the inquiry, they consider it will be necessary to secure the command of not less than one acre of land for every forty or fifty of the population of the district—that is to say, 140 to 150 acres of land ought to be secured.

TWICKENHAM.—ALLEGED NEW METHOD OF DEALING WITH SEWAGE.—At the last meeting of the Twickenham Local Board, Mr. Ramsay, the surveyor to the Board, stated that for some time past he had been studying the drainage question, and he believed, after all, that he had hit upon a scheme of his own, which would be the system for the Board to adopt; but not having secured a patent, he could not give his system in detail at present. However, if the Board would meet him in the expense of erecting a necessary temporary building, which would cost £30, he was so sanguine of success, that he would pay half if the Board would find the other half, and as his scheme was so simple—no machinery being required—it would be cheaper by far than any other proposed. The Board consented to bear half the expense. We understand that the whole operation of utilising the sewage by Mr. Ramsay's method is carried out and completed within a building in the most simple and inexpensive manner, the solid precipitate being rendered entirely free from offensive smell, and the effluent water sufficiently pure for discharge into the river.

DRY ASH CLOSETS.—Respecting the dry ash-pit system, Dr. Syson remarks: "Nothing positive can be said as to the success or non-success of the new system of dry ash-pits until it has stood the test of a hot summer. I consider the fact that by means of it the old wet sunken ash-pits are for ever abolished to be in itself a great step in the right direction."

LAND AND BUILDING SOCIETIES.

ACCRINGTON AND DISTRICT PERMANENT BUILDING SOCIETY.—The first annual general meeting of the members of this society was held on Thursday week at Accrington. The report and balance sheet showed that the total amount of subscriptions received up to June 18 last was £2049 13s. 6d.; total subscriptions withdrawn, £44 16s.; total amount of loans, £1694 15s., of which sum £350 5s. has been repaid; number of members, 120; number of shares issued, 1316. A dividend to the shareholders of 6 per cent. per annum was declared.

IMPROVED INDUSTRIAL DWELLINGS COMPANY (LIMITED).—At a meeting of the directors of this company on Tuesday last (Sir S. H. Waterlow in the chair), it was decided to recommend the payment of a dividend at the rate of 5 per cent. per annum for the half-year to the 30th June, and to carry forward a balance of £2588, which is equal to a further 4 per cent. on the subscribed capital. The receipts have been £6951 13s. 7d., and the expenditure, including all contributions to the reserve funds, amounts to £3523 8s. 9d., leaving a balance of £3,428 4s. 10d. The net profits have been at the rate of £5 17s. 2½d. per cent. No interest has been charged on capital expended on works now in progress, or revenue would have been improved by a sum equal to 15s. 3½d. per cent. The report of the directors states that, with one exception, the general position of the company's estates, on which £167,789 has been already expended, must be regarded as highly satisfactory.

LEGAL.

DISPUTE AS TO STONE-DRESSING.—ELLIS v. CARR AND ANOTHER.—This suit, heard at the Wakefield County Court on Tuesday week, was brought to recover £17 10s. 8½d., being the balance of an account of £26 16s. 2½d., for dressing stone. The plaintiff is a builder at Horbury, and he was employed by the defendants, who are woollen extractors, carrying on business at Coxley, near Middlestown, to hew the stone for a boiler shed. The plaintiff charged for the job by day-work, but the defendants contended that the agreement was that the work should be charged for by the piece. Mr. Law, of Dewsbury, the architect of the building, deposed that he measured the stone as the work was done, and found that, at ordinary piece-work prices, the amount due to the plaintiff was £14 4s. 10d., including 17s. 6d. for day work, which it was admitted had been performed by the plaintiff's men. His Honour gave a verdict for £5 10s., including the sum paid into court (£4 10s. 7d.), but because of the exorbitant claim made by the plaintiff, he refused to allow costs of either attorney or witnesses.

INSUFFICIENT FOUNDATIONS.—CHAPMAN v. LEE AND OTHERS.—At the Grimsby County Court, on Thursday week, the case of Chapman v. Lee was heard. The plaint, which has several times been before the court, was originally brought to recover compensation for damage done to a house belonging to plaintiff, by the sinking of the ground on which it stood, caused by placing a heavy building (viz., a friendly societies' hall) on the ground adjoining. At a former hearing, his Honour decided that the plaintiff was not entitled to recover the damages to the house, as it had not been built twenty years, but he would grant a case for the court above to determine whether the plaintiff was entitled to compensation for the damage to the land, which had been sunk below the horizontal plane by the negligence of the defendants in placing so heavy a building upon an insufficient foundation. The points of the case were argued by Mr. Wintringham for plaintiff, and by Mr. Ayre, of Hull, for the defendants. His Honour decided between them.

COURT OF BANKRUPTCY, LINCOLN'S INN, JULY 18.—(BEFORE MR. REGISTRAR PEPY'S.)—RE MAGNUS.—The debtor, described as a slate merchant, of Buckingham Palace-road, Pimlico, recently petitioned the court, under the arrangement clauses of the new Act, with debts stated to amount to £35,070, and Mr. Farran, manager of the Valentia Slate Company, had been appointed to act as receiver. The assets are said to be of considerable value. Mr. Brough now applied, pursuant to notice of motion, for an enlargement of an injunction, granted on a previous occasion, staying proceedings by creditors, until further order of the court. His Honour granted the application. Injunction extended accordingly.

Our Office Table.

THE ROYAL ARCHITECTURAL MUSEUM.—The Council of the Royal Architectural Museum are anxious to form a small library at the Museum for the use of the art-students and workmen studying there. They have, therefore, issued a list of the works most desired, with the hope that friends will help them, either by subscribing money for the purchase of the books, or lending or presenting new or second-hand copies. We are also requested by the Council to remind members that the museum is now open free to them on the evenings of Tuesday, Thursday, and Saturday, from 7 till 9.30 (the vacation months of August and September excepted), but as the arrangement entails considerable expense in lighting, &c., its continuance will depend on the numbers attending.

THE SERPENTINE.—A contract was signed on Friday last by which, in consideration of an additional sum of £5000, the contractor binds himself to remove the whole of the mud from the bed of the Serpentine. This will, however, leave the Serpentine much too deep for the safety of bathers, but it would cost, it is said, no less than £28,000 to fill it up to a safe depth with gravel, or any other acceptable substitute for the mud which will be removed

New Process of Casting Metals.—On Saturday a number of gentlemen met at the works of the Lancashire Engineering and Compression Casting Company, St. Helen's Junction, on the Manchester and Liverpool line of railway, to witness the new process of casting, in brass and iron, chased and embossed work of the most elaborate description. The process, which was here for the first time exhibited in England, is an American invention, and its utility was shown to consist in this—that any design, whether in high or low relief, chased on metal of any required pattern or shape, whether flat as a door plate or round as a vase, can be reproduced by castings from it *ad infinitum*, and each casting will show upon it all the sharpness and beauty of the original chasing. Moulds are made with a preparation of fine clay from the articles to be reproduced. The making of one of these moulds takes a person from five to ten minutes. The moulds have then to stand 24 hours to air dry, after which they are baked in a furnace for eight hours. These clay moulds, into which the metal is afterwards poured, are to all intents and purposes encaustic tiles. The clay moulds are placed in a box, and the air is extracted from them so as to form a vacuum, after which the molten metal is forced into them, and in this way, in ten minutes, a casting can be completed. When the casting is taken out, the design, however intricate, is found to be perfectly represented, with the exception of removing a slight surface of clay from it, which can be done in half an hour, and the article is then ready to be sent to the bronzer, instead of having to be kept in the chaser's hands. In this way an enormous amount of cost and labour on ornamental articles in metal is saved.

Steam Road-rolling at Poplar.—At the last meeting of the Poplar District Board of Works, Mr. R. Parker, the surveyor, brought up a special report on the use of Messrs. Aveling and Porter's steam road-roller, which has been at work in this district for nearly nine days to assist in re-coating macadamised roads. The weight of the roller is 15 tons, and it has four wheels or sections, which are so fixed as to cover a space of 6ft. in width. The maximum quantity of broken granite and Bombay stone used in one year throughout the district is 4723 tons, which would employ the roller 82½ days, or little more than three months in the year. The hire of the roller and two men for the period would cost £165. Supposing the roller to last ten years, the following figures show the comparative difference of the expense between the hire and purchase of it:—Cost of roller, £550; maintenance, £250—total, £800 in ten years. If hired 82½ days per annum, at £2 per day, for ten years, £1650; from which deduct two men's wages, 82½ days per annum, at 9s. per day, £371 5s.; net cost of hire, £1278 15s. This leaves a balance in favour of purchasing the roller of £478 15s. for ten years, or £47 17s. 6d. per annum, against which there are two things to be considered—viz., a building must be provided in which to keep the roller, and how are the men to be employed whilst the roller is not at work?

Discovery of a Roman Pavement in Gloucester.—Workmen employed in digging out the foundation for a house in the Commercial-road, Gloucester, came last week, at a depth of about five feet, upon a large portion of a beautiful tesselated pavement, with a bordering of unusually large gray and blue tesseræ of rather a coarse kind. Next to this was a very beautiful design in blue, white, and red tesseræ, of quarre-foil character, surrounded with a guilloche border; and a few feet from this another piece of tesseræ of geometrical design. As usual, intruders removed some portion of the material; the remainder has been secured. The colours were exceedingly fresh and vivid. A Roman key of elaborate workmanship was also found. The discoveries are of much interest, as proving the existence of Roman dwellings at least three hundred yards further southwest than any previous remains had suggested.

The Proposed Assistant-Surveyorship of Public Works.—The Commissioner [Mr. Ayrton] will leave his monument behind (says the *Saturday Review*) in the organisation of the office of which he has been the temporary tenant. After dispensing with Mr. Fergusson, suppressing the post held by Mr. Pennethorne, and giving Mr. Barry his *congé*, he has found that an Engineer officer hot from the Board of Trade and the War Office, and prompted by a glorified Clerk of the Works, was not sufficient to act the part of national architect, and he has accordingly, with the assent and consent of his economical masters, proposed to invest £700 a year in some tame architect of overlooked merit competent to do for the nation that which a Scott, a Barry, a Street, a Waterhouse, or a Burges could not be entrusted to perform. He appealed to the Institute of Architects to help him in his difficulty, and the Institute, of course, told him to look out for himself. So, with an ostentatious flourish of Spartan virtue, the new appointment has been thrown open to the competition of all or any architectural aspirants who will condescend to present themselves for examination before the Civil Service Commissioners. . . . "Design and superintend new buildings" and "spell properly"—Such are the qualifications of the man to whom Mr. Ayrton proposes for the future to entrust the national taste!

Regulations and Fees for Hoardings and Scaffolds in the City.—At a meeting of the City Commissioners of Sewers on Tuesday last, the Streets Committee, to whom it was referred to prepare the necessary license for hoardings and scaffolds, and the rules and regulations affecting the same, so as to accord with the opinion expressed by the Court of Queen's Bench on the powers of the City Commission of Sewers under the Act (see Building News for June 3), stated that they had had a report from the engineer and the solicitor, which they laid before the Court, with amended regulations, scale of fees, and form of license, and they recommended the adoption of the same. They further recommended that, in the event of any disagreement between the applicant for a license and the inspector of the district as to the length of time during which any hoarding or scaffolding should remain, the case may be referred to the Commissioners or to the Streets Committee, whichever might first meet, to determine the point in dispute. The recommendations were approved.

Chips.

The Otley New Mechanics' Hall, the foundation stone of which was laid on the 19th June, 1868, is now approaching completion. The stonemasons, joiners, and slaters, have all nearly completed their respective contracts, and little remains to be done save the plastering and painting. It is expected that the building will be completed and the new hall opened by November.

The south transept of Ludgershall Church, Hants, is being reseated. An Early English arch, in a most perfect state, has been discovered and opened out.

Mr. T. J. Horsley, a well-known local artist, died on Sunday week at Sunderland.

Wembdon Church, near Bridgwater, which was destroyed by fire a year or two since, has been rebuilt and opened for public worship. The tower and chancel were saved from destruction, and the expense of rebuilding the remainder has been £1250. The church has been increased in size, and will now accommodate 360 persons—about 100 more than formerly.

A new church is projected in the parish of S. Alkmund, Derby. A site has already been given.

Captain Arkwright, R.N., M.P., has promised £100 towards the restoration of Tideswell Church, Buxton, Derbyshire.

The erection of new schools for the parish of S. Luke, Leicester, is about to be commenced.

A public meeting has been held at Syston, Leicestershire, in furtherance of a scheme for the complete restoration of the parish church. The total cost is estimated at £1000.

At a special meeting of the Retford Highway Board, on Friday last, a committee reported that they had found Mr. Scott, the surveyor, deficient in his accounts to the amount of £227. Scott, who was present, fully admitted his defalcations.

A new schoolroom has just been opened at South Hykeham, Lincolnshire. It has been built from designs by Messrs. Drury and Mortimer, Lincoln, and is of red brick, with stone dressings. Ventilation is provided for by means of patent ridge tiles.

Mr. T. O. Barlow, the engraver, has just completed a portrait of Mr. John Fowler, engineer, from the painting exhibited by Mr. Millais at last year's exhibition of the Academy.

Tenders are invited for the enlargement and improvement of the School House Bridge, at Ashbourne, Derbyshire. Mr. G. Bridgart, the county surveyor, has prepared the plans and specifications.

A local paper says it is reported that a well-known surveyor of Deptford has offered to perform the duties now undertaken by Mr. Smith and Mr. Heward, engineer and surveyor, and road surveyor respectively, to the Greenwich District Board of Works, at about one-half the amount at present paid in the shape of salaries.

The Penzance Dispensary is to be converted into an infirmary. It has been determined to purchase the old poorhouse at S. Clare for that purpose.

During the last year, considerable additions have been made to the Swansea Hospital, the accommodation for in-patients having been increased by 40 beds. The erection of salt water baths for the hospital is contemplated.

The foundation stone of the new college buildings at Eastbourne will be laid on the 30th inst. by Lady Edward Cavendish.

A new Wesleyan chapel was opened at Ridgeway, Dorsetshire, on Wednesday week. The chapel will seat 170 or 180, and has been built by Messrs. Otter and Spicer, from a design by the Rev. A. Puddicombe, who acted as honorary architect.

Longfleet Church, Dorsetshire, is being re-seated.

A new Independent chapel was opened at Brompton Ralph, Devonshire, on Wednesday last.

The chancel of the parish church of Bedfield, Framlingham, was re-opened on Friday last, after having been thoroughly restored.

The trustees of the Sekforde Charity, have instructed Mr. Robert Reid, of London, to value the portion of the estate about to be taken by the Middlesex magistrates for enlarging the House of Detention at Clerkenwell.

Timber Trade Review.

The sale by auction, yesterday, at the Baltic Saleroom, Threadneedle-street, comprised the following lots. Holders of Prussian timber will be fortunate in obtaining high prices, the declaration of war having closed Prussian ports. Hull, Grimsby, and Hartlepool will be severe sufferers in consequence:—

500 Loads Dantzig and Memel fir timber.
150 ,, Quebec red and yellow pine.
400 ,, Halifax birch.
150 ,, Quebec walnut.
150 ,, Swedish and Norway balks.
100 Memel wainscot logs.
450 Dantzig deck deals.
22,000 Quebec yellow pine deals, &c.
23,000 Lowerport spruce.
16,000 Riga white.
12,000 Skonvick and Ljusne
10,000 Gefle, Hudekswall and Sundewall.
10,000 Gothenburg and Uddevalla.
55,000 Dram, Christiana, and Vefsen.
40,000 Prepared flooring boards.
250 Fathoms lathwood.

THE BUILDING NEWS.

LONDON, FRIDAY, JULY 29, 1870.

ROCK ASPHALTE PAVING AND TAR PAVING.

IMPROVEMENTS applicable to the vast extent of our common roads need none of the usual common-places about the necessity for facilitated communication to recommend them. The metropolis annually pays nearly a million for the extension and maintenance of its streets and roads, though everyone with lungs to suffer from the dust they create, or with ears for the fearful rattling of the carts and horses' hoofs on the frequented streets, or possessing any feeling for the sufferings of the animals dragging loads over the loose stones of the 200,000 miles of English macadamised roads, must see that there is room for many improvements in our common roads.

There is just now much talk about asphalte paving as a means of avoiding some of the miseries and expense we have to bear. Professor Tyndall's rather sensational revelations about the amount and quality of the dust in London air have lately directed the somewhat evanescent and capricious energies of popular attention to the subject; and it is marvellous what an amount of futile gabble can be heard about the use of asphalte. A late number of the well-known medical periodical, the *Lancet*, under the heading of "London Dust," alludes to the injurious action on "children and the ailing" of the fine particles thrown off our roads, and describes the losses dust causes to furniture, clothing, and in dwelling-houses generally by its presence. It is notorious that the Regent-street shopkeepers have their goods injured by dust to the extent of from £30 to £300 annually. The remarks of the medical periodical are necessarily of weight, as bearing on the contamination of the air we breathe; the remedy proposed—that of the adoption of asphalte pavement—is more open to question. A long letter to the *Scotsman* from Mr. William Chambers, the late Provost of Edinburgh, strongly advocates the same material; and generally, as we have said, there is much talk on the subject. We venture, however, to think that, except, possibly, on some of the narrow streets of the City, on many of which, in fact, there are still existing fossil specimens of wooden pavements—we do not think that asphalte paving, for streets at any rate, has, to use a French phrase, much future before it in London. At the same time, we are glad to notice, that it is being rather extensively laid down in Holborn; and that, as we reported last week, it is to be tried in the Poultry and Cheapside.

Let us first see what this proposed material for our roads really is. The partial success in Paris of the substance forms the chief *point d'appui* of its advocates; and it has there been found that the best material is the hard limestone rock found at the Val de Travers, Neufchatel, Switzerland. It contains, equally diffused throughout its structure, from 11 to 12 per cent. of bitumen. This material is ground to powder, which, before being put to use, is heated in a revolving cauldron. The powder, thereby softened, is spread evenly on a concrete bed, and then rolled down by steam or other rollers. In Paris it has also been stamped with warm stampers; and this is the plan now being carried out in Holborn. In cooling it contracts, and assumes its original hardness, so that within a couple of hours it is so hard that carriages can run over it. The asphalte surface is about 2in. or 3in. in depth, so that the bed of concrete has to be thick to prevent the covering bending under the traffic. It is undoubtedly very smooth and easy for the passage of wheels, is almost noiseless, and is free from dust. In Paris it has even been calculated that the smoothness of the streets thus laid causes an annual saving of nearly three-quarters of a million of pounds in wear and tear of carriages and horses; but the bases of this estimate—for obvious reasons difficult to get at—seem to us of rather doubtful stability. In London, a favourable instance as regards absence of noise is undoubtedly the asphalte pavement of Threadneedle-street; and only lately upwards of 100 owners and occupiers of Old Broad-street petitioned the City Commissioners of Sewers to lay their street with the material. We have here an instance of the use of asphalte for carriage roads; and for what seems to us its more legitimate employment as a foot pavement, one encouraging precedent is to be found in Trafalgar-square, where a smooth even surface, very pleasant to the feet, has shown for years scarcely any wear or deterioration. The asphalte there laid down is that of the "Pyrimont" Seyssel Asphalte Company, the merits of which have been noticed by us on more than one occasion.

This is the pleasant side of the medal; we now come to the obverse. One main objection is the great expense. The price, from 18s. to 20s. per square yard, or rather more than that of the best London paving setts, is a serious item; and as the use of the material is a monopoly in the hands of a French Company, this cost is liable to be raised with any increased demand. Now according to a work* we have lately noticed, it is estimated that within a radius of only 12 miles from Charing-cross there are not less than 40,000,000 square yards of macadamised roadway alone. If it be supposed for a moment that asphalte can compete with macadam, we should be glad to know where the £40,000,000 are to come from to lay all this area with asphalte.

Even this expense would have to be increased if, to aid the thin 2in. or 3in. coating to withstand the traffic, the asphalte were laid, as it should be, on a solid bed of concrete. At this rate it would cost more than paving, which, in setts 9in. deep by 4in. wide, costs about 18s. per square yard when laid on a coarse gravel bed.

The want of foothold for horses on asphalte pavement is so great that it could not be thought of for gradients. In Paris, as we have ourselves noticed, the horses can often be observed to struggle very painfully on it for foothold, as it gets greasy and almost as slippery as ice in some states of the weather. This fact can also be often proved on the short length in the City of London. In any case, its durability under the heavy London traffic has also to be proved; and this can only be done in the course of years. Even in Paris, instances of its taking bends, and a wavy surface under heavy traffic can be seen. Passing through Threadneedle-street the other day, we noticed that this tendency to a wavy surface was already shewing itself, though the asphalte has not, we believe, been laid down there longer than 18 months.

Another objection in London is the difficulty of getting at the gas and water mains, and underground telegraphic wires, for repairing purposes. This difficulty would not be felt so much in the French capital, where centralised administration has long extinguished the rivalries of gas, water, and telegraph companies—the mortal enemies of non-steam-rolled macadams. One remark we may also add, though we do not cite it against asphalte when properly laid and treated. It is noticeable that, possibly on account of some reason connected with differences of thermal expansion and contraction, asphalte foot pavements often open across at regular intervals. This can be seen in many instances; as, for example, on Charing Cross Bridge, and an old pavement leading out of Spring Gardens into St. James' Park. However, in all these matters, the great question is expense of first outlay and maintenance. As capital at five per cent doubles itself in about 14 years, we see one reason why first cost exercises such dominion over sublunary affairs.

A cognate subject is that of tar pavement, of which an account was lately given by Mr. Methven, of Bury S. Edmunds. The conditions of cost are evidently different; but the smell, often strong when fresh, is an objection. It is made of the cinder dirt from gasworks, of shingle, or a mixture of both. As a preparation for foot pavements, the material is burnt in heaps like ballast, and when hot is mixed on the ground with hot tar. A fire of coke is covered with cinder dirt or shingle. When this layer is hot, another is added and so on in succession, until a large enough heap is made. The tar is boiled in an iron copper, and when heated, mixed with the hot material from the heap, in quantities of two bushels at a time, in about the proportion of one gallon to every bushel of cinder dirt, and slightly less than a gallon for the gravel. It is turned over and over with the shovel until every portion gets a covering of tar. The whole is passed through a sieve and put in heaps till required. Before the pavement is laid, an edging is provided about two inches thick, and projecting two inches above the surface of the ground to be covered, which should be made tolerably even, and near the kerb, be well trodden on or rammed. In laying, the rough stuff is put down first, and rolled until tolerably firm; then the second quantity is put on, and then the third; and when the whole has been levelled, a little of the finest material is sifted on, and a little fine white shingle or Derbyshire spar sprinkled on the top. The whole must be well rolled. The best roller is a water ballast roller, which is used at first without ballast, and wetted to prevent adhesion of the material. When the pavement is slightly consolidated the full weight should be applied. For heavy cart traffic the hard material should be shingle. Both descriptions of pavement are laid best and most easily in warm weather, and should be rolled when the sun has warmed them well. Tar pavement can be laid at 1s. 4d. per square yard; or, in some cases, for even less. This last fact gives the use of tar a much greater importance in our eyes than the costly Swiss asphalte. Many road reformers look with hope upon the use in this way of the refuse of our gas works, possibly mingled with a quantum of concrete. The description we have given of tar paving applies to foot pavements, which are evidently under very different conditions of wear and tear to horse roads. Cart roads have thus also been made of tar binding together stone metalling of about the size of walnuts, without any mixture of cinder dust. Up to the present, however, no composition has been found to beat the common broken stone road, and when the public fully understand the great economy and advantages of steam rolling them, as in Paris, we do not think that any road in this great steam-using country will be made and maintained without the use of the steam road-roller.

THE DECORATIONS OF THE SMALLER REFRESHMENT ROOMS AT THE SOUTH KENSINGTON MUSEUM.

ON the left hand of the Central Refreshment Room which we have described, is a much smaller dining room, the decoration of which was wisely entrusted by the Department to Messrs. Morris, Marshall, Faulkener, and Co. At the hands of this firm of decorative artists we expect much, and need not be disappointed in this instance. The room is what every decorated room should be, quiet and reposeful; one is not distracted by glitter in every direction. The work possesses that essential quality of tone to which we referred in our last article on this subject.

We are not, however, disposed to admire indiscriminately all that even Messrs. Morris choose to set before us. There is a certain wilfulness in all they do, and they set one's teeth on edge occasionally, as if with *malice*

---

* "On the Economy of Road Maintenance and Horse Draught through Steam Road-rolling, &c." By F. A. Paget, C.E., &c. London: Spon, Charing-cross. 1870.

prepense, for the sake of asserting their independence, and letting us know that they neither are, nor intend to be, exactly as other men. What we mean will become evident as we proceed with our critical description of this work.

The flooring has not formed part of the scheme, but simply corresponds with that of the rest of the Museum in being simple and unpretending tile work, such as we described in our last notice. The dado, which is a high one, contains some mouldings of a Queen Anne type, the adoption of which we look upon as one of the freaks of this firm. Upon this dado is an upper tier of panels, which has been made one of the most interesting features of the room. The whole of the woodwork here enumerated, except these panels, has been painted a deep, quiet green, such as would be compounded of black and yellow pigments. The panels are highly decorated, some few with figures executed in a high style of art, and the rest with flowers, leaves, and fruit upon a gilt ground. There seems but little order in the arrangement of the few figure panels among the rest, and their proportion would not exceed one in six. The principal part of the wall above this dado, with its range of decorated panels, is covered with a bold and rich ornament in moulded plaster work, representing branches of olive trees. The ground, as well as the ornament, is a refined, subdued green, but the ground slightly darker, so as to throw out the ornament in relief, and the central fibre and outer edge of the leaves seem to have had some of the colour wiped off, and thus shows the white ground beneath through the paint. The general effect is also enriched by dark berries, and flowers coloured pink with a white centre. This description would, however, hardly prepare the reader for the exquisite harmony that has been produced by this combination of greens with but slight contrast and relief. This portion of the decoration is, to our minds, simply perfect, and by far the most successful portion of the decorative treatment of this apartment. The frieze above is more open to criticism. It forms, in raised plasterwork, a sort of bold fret, enclosing oblong panels, in which disport greyhounds and hares of the most comic description. They are ungainly and clumsy, and we are quite at a loss to account for their introduction. The rich and deeper colouring of this frieze is, however, very effective, and the manner in which the bold egg and tongue moulding which crowns it is treated, is an instance of the method in which every touch is made to tell by true artists. The eggs are gilt and the hollows in which they lie painted vermillion, and the value given to the gold and its surroundings by contrast is great. A portion of the ceiling round the room drops some inches below the rest, and is intersected by the soffits of bracket beams, which form part of the construction of the floor above. The whole of the ceiling is white, decorated with quaint and lightly designed ornaments in a subdued yellow ochre tint. It consists of a series of circular, sunlike rayed patterns, the lozenge-shaped spaces between them filled with conventional foliage. The soffits of the beams in the outer part are a dark brown, approaching black, studded with most delicate white flowers in triple rows on each bracket. This is another pleasing and refined touch, which tells well. Altogether, we congratulate Messrs. Morris on the result, which we consider highly successful, in spite of the hare hunt, which would disgrace a nursery, and be hooted at by its infant occupants.

Four sun-lights seem to have been stuck through the ceiling since Messrs. Morris left it, and they interfere with and destroy some of the patterns of their decoration, and have blackened with smoke a further portion, which, of course, is greatly to be regretted.

We ought not to omit, as an integral part in the general scheme of the decoration of this aparment, the treatment of the windows, which are three in number, of two lights each, lofty and square-headed. A band with figures, one to each light, is carried in one line across the whole. There is but one figure of a lady in each, tending flowers or playing music, or occupied in some other simple way; the figures are in pearly subdued white, with gentle yellowish-diapered draperies, and, of course, golden hair, and the backgrounds of the panels in slightly deeper tints, as brown, blue, &c.; the rest of the windows are filled with circles of glass with delicate ornaments in brown touched with yellow, and a simple bordering runs round each light. Thus the windows are not obtrusive, and fall in with the rest of the work of decoration harmoniously.

The other apartment, which is known as the "Grill Room," from the cooking purpose to which it is devoted, has had its decoration entrusted to E. J. Poynter, Esq., A.R.A. We apprehend that Mr. Poynter's increasing fame as an artist has interfered with the execution of this commission, for the room has remained in the same unfinished condition in which it now is for a long period. It is impossible to judge of the effect intended to be realised as yet, and the principal object of which it can boast is a splendid cooking-range for grilling chops. We wonder whether Mr. Poynter can lay claim to its design, which seems from the hands of a first-rate Gothic architect rather than those of a painter. At any rate it is an admirable example of metal work, in which cast and wrought iron are used and decorated as each ought to be, and constructive requirements and artistic effect have been studied together. The treatment of the walling is peculiar and original, and promises to be effective. It is covered with a framework of panelling in brown, hard, woodwork, and the panels are to be, and already have been partially, filled with slabs of porcelain, with white ground and blue ornament, in imitation of old china. Some of the larger panels are of a great size, and pictures in this monochrome manner have been executed for them, and all this painting and pattern drawing upon the porcelain, we are told, is by students of the Department. The only adverse criticism that we have to make is that perspective and distances seem too much indulged in, especially in the more ambitious and larger panels. All such wall decorations, and certainly even more rigidly such as these in monochrome, should be kept as decorative work in one plane. Above this panel work is a frieze of stamped plaster, a series of peacocks with fully extended tails, and fruit shrubs, which we should much like to see coloured by the pencil, or at least under the direction, of Mr. Poynter himself. The ceiling has been arranged after the insertion of the gas sunburners, and they accordingly fill each a single panel in a general arrangement, without spoiling it, unless by their blackening process hereafter, but which, we hope, has also been obviated. Some still more delicate plaster-cast ornaments surround this ceiling, and afford ample scope for treatment in colours.

Another part of the Museum owes its resplendent lines to Mr. Owen Jones, who has so well studied Oriental and Moorish decorations, and Mr. W. B. Scott is engaged upon a series of designs for glass painting for the windows of the Ceramic Gallery, while numerous well-known names are engaged upon designs for panels of Mosaic work. To these we intend to devote our attention upon a future occasion, as we take the highest interest in these attempts after a better style of decoration than has of late years prevailed.

◆

WROUGHT IRON CRANES.—II.

In our last article on this subject, the solid-sided or plate-web crane was the example selected for illustration and description. Its merits were pointed out, and its disadvantages also investigated. Before proceeding to determine the nature and extent of the strains that act upon a crane, we will briefly notice the constructive difference that exists between the open and the solid web form. To avoid needless repetition, and not to introduce more cuts than are necessary, we will assume that the duty required of the crane is sufficiently severe to necessitate that it should be of the double web type—in fact, an open-sided tubular crane. It will be at once seen that while this form possesses all the advantages with respect to stiffness that is given by the solid-sided form it is also free from its disadvantages. There is no difficulty in examining every part of it, and painting and repairing it when necessary. In Fig. 1 is represented the elevation of a lattice bent crane with a double series of triangles in the web. Frequently the crane has a web of the Warren type, in which there is but one system or series of triangles, but the arrangement of the number of series depends altogether upon the size of the crane, and especially of its depth. The deeper the web, the greater must be the number of intersections of the bars, or the greater must be the amount of stiffness given to them, either by increasing the sectional area of metal in them, or adopting a form of section adapted to ensure the requisite rigidity. It will be at once apparent that the greater the number of the crossings of the bars the less becomes the actual length of any unsupported bar. Every intersection of two bars, supposing it to occur at the middle of their respective lengths, virtually reduces those lengths one-half, and the stiffness of the bars is thus nearly doubled, for while the original strain remains the same, the tendency of the bars to deflect is very considerably diminished. This was one of the causes that speedily proved how deficient the Warren system was in those points when girders of large span were proposed to be constructed on that principle. It was soon discovered that it was absolutely impossible to construct a deep girder with only one series of triangles. The amount of material that it was necessary to introduce in order to afford the proper degree of stiffness to the bars was very much in excess of that which would be required in a solid-sided or plate girder. It must be borne in mind that the superior economy of the open or lattice type of girder over that of the plate system rests in the web, and in the web alone. The flanges or horizontal members of both systems are nearly identical. If, in designing a large girder on the lattice principle, the saving is not effected in the web, it cannot be obtained in any other part.

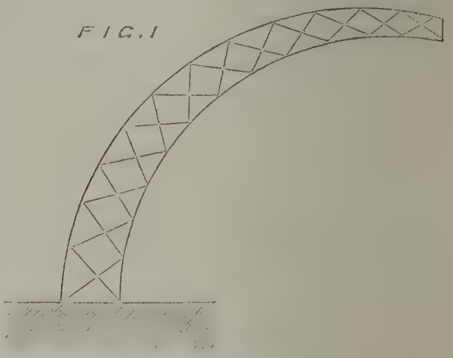

FIG. 1

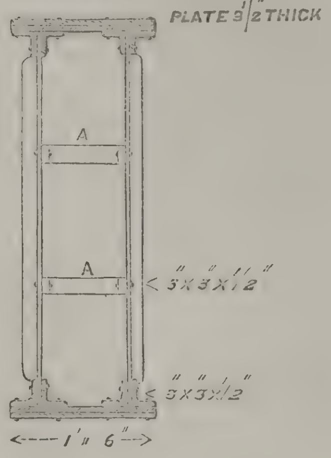
The section of the crane shown in elevation in Fig. 1 is represented in Fig. 2, and, with the exception of the web or sides, does not differ materially from that given in our last article. Directly the horizontality of the flanges is departed from the strains upon the bracing or bars connecting the upper and lower flanges, and constituting the web, become very complicated, and it is by no means easy to ascertain without some slight consideration, which of them act as struts and which as ties. When we proceed to analyse the strains upon a bent crane, and the manner in which each separate bar is affected by the load, it will be demonstrated that those which slope towards the lower or fixed extremity of the crane are subject to compressive strains, and, *per contra*, the others to those of a tensile description. But this is not a universal rule, for a great deal depends upon the radius of the upper and lower flanges, the depth of the web, and the angle of inclination of the bars. This angle is continually changing, which is the great impediment to the use of mathematical calculation for these examples of construction, In those instances where the flanges, both upper and lower, are horizontal and parallel to one another, the angle of all the diagonal bars is constant, and the calculation of the nature and amount of the strains may be effected either by geometrical diagrams, or by simple and readily deducible formulæ. But directly either or both of the flanges assumes a curvilinear outline, this simplicity of calculation is at once lost. The ordinary formulæ are no longer applicable, and those that would theoretically apply to each particular case in question are so exceedingly troublesome, complicated, and uncertain, as to be practically useless. It is not too much to assert that to attempt to employ algebraical or mathematical equations and formulæ to some of the examples of girder construction would be to attempt a practical absurdity. Recourse is therefore had to the graphical method, and by means of a diagram of strains the proportons of the several parts can be accurately determined. At present we are not concerned with this part of the subject, which will be fully discussed in a subsequent article.

A reference to Fig. 2 will show that a plain bar section will not answer for the compressive bars in the web of a bent crane. This is owing to the fact that a plain rectangular bar has little or no lateral stiffness. It is true that when occupying the position of one of the diagonals in the web of a girder designed on the lattice principle, it is stiffened to some extent by the intersections with the other bars. But this is not sufficient, and it becomes necessary to adopt a form of section that by virtue of its own shape shall possess some degree of inherent stiffness and rigidity. Independently of this reason there is another. It is that although the intersections of the bars do contribute to the stiffening of the web of the girder, yet they are not supposed to actually prevent the bar from deflecting. There is little doubt that they do in reality do so, but it must not be taken into account when proportioning the bars, because it is always assumed that there is no extra strain brought upon the respective bars by their being rivetted or bolted to one another. It is at the same time manifest that if they were prevented from deflecting, in consequence of the points of intersection, there would be a considerable transverse strain induced upon them. This strain, which would increase with the length of the bar, would altogether vitiate the whole principles of girder construction, as we have already frequently explained in our columns.

The form selected for the compression bars in Fig. 2 is that of angle iron, but there are several other forms equally suitable. Of these, tee or channel iron are to be preferred, but they all yield to angle iron in simplicity and facility for attachment. Moreover, the last description of section is that most readily procurable in the market. It can always be obtained of the usual scantlings at a very moderate price per ton, whereas some of the other sections are only to be obtained by special order, thus entailing a long delay, and sometimes are not to be had at all. There is no greater mistake made than to design a structure with a quantity of impossible-shaped material in it. As a rule, always select those forms, sections, and sizes of iron that are the most readily obtained, and at the most moderate cost. It is not only the shape of the iron that is of importance, but the dimensions. When bars beyond a certain length in one piece are wanted, or plates containing more than a certain maximum superficial area, there is an extra price per ton charged. Thus, a narrow plate of about 12in. broad can be procured at the ordinary market prices in a considerably longer single length than one of 24 or 30in. in length.

At the time of constructing the Britannia Tubular Bridge over the Menai Straits, there was the greatest difficulty experienced in obtaining plates 12ft. in length. Since that time our iron manufacture has made a great deal of progress, but still long plates are very expensive. This is owing to a combination of many circumstances. In the first place, the larger the plate, the greater the trouble and expense of handling and transporting it from one place to another. Secondly, the difficulty of rolling a plate or bar that shall be homogeneous in consistency increases enormously in proportion to an increase in the size ; and, thirdly, larger and more expensive rolling machinery is necessary than for plates and bars of the ordinary dimensions. Besides stiffening the bars in the web of the bent crane in the plane of the elevation of the crane, they also require some bracing in a plane at right angles to the face of the web. The opposite bars have to be braced together transversely, as shown in Fig. 2. This is usually effected by introducing small pieces of bar or angle iron, and rivetting them (see A A, in Fig 2) to the diagonals at their intersections with each other.

FIG. 2



In large examples, the opposite diagonals are united, not merely by horizontal pieces of bar, but by a regular system of cross bracing, so as, in fact, to convert the whole couple of diagonals into a small braced girder of itself. Wherever the depth of the girder is small, this is not needed, but the plan shown in Fig. 2 will afford all the security required.

We must reserve for the next article on the subject the investigations into the strains upon these braced specimens of construction.

◆

SUNDRY CASTLES OR CRENELLATED MANSIONS IN SHROPSHIRE.

We resume our remarks (see preceding article, No. 807), on castles, &c., in Shropshire.

Ludlow Castle on its lordly site, is too well known for us to dwell upon it in this notice, which we have undertaken with the view of calling attention to the numerous and interesting specimens of smaller castellated mansions with which this border county of Shropshire abounds. Some interesting drawings are extant which were made by one Thomas Driveley, who accompanied Henry, first Duke of Beaufort in a tour through Wales, and of which an account is given in a manuscript entitled "Cambra Britannica," preserved in the Library at Badminton. This chronicler speaks of having attended service in "Prince Arthur's Chappel" in the Castle, and speaks of "The Castell Hall" as very "faire," and of "the Council Chamber where ye judges dine," of "ye great hall and ye room below stairs, and ye council chamber, ye President's bedchamber, with a withdrawing room for privacy ;" and says that "above stairs is a large dining-room famous for its roof of large tymbers, near which is Prince Arthur's bedchamber, said to have a double heart, according to ye device seen therein painted and gilded against the wainscot, and that next above stair to be considered is ye Lord President's Lady's room, and her bedchamber, furnished by his Majesty with lemon-coloured damask." By this extract it will appear that this important structure contained more than the usual number of stories, but it refers to buildings of several successive dates.

The great Keep Tower was built by Roger de Lacy soon after the Norman Conquest. The sketches referred to above show the domestic buildings added to it by Sir Henry Sidney. The chapel, which has been noticed, is perhaps the most interesting portion of the whole that has been preserved. It consists of a circular tower of Late Norman work, with an entrance doorway of three recessed orders, with nook shafts in the jambs, and richly decorated semi-circular arches. A string-course divides the exterior of the tower into two unequal stages. The upper one, which is the loftier, has a few plain Norman windows with a considerable height of plain walling above them, and is finished with battlements. There is a rich chancel arch within, similar in character to the entrance doorway already described.

Of *Wattlesborough Castle*, all that remains is a square Norman Keep Tower with wide flat buttresses at each angle. This fragment stands in the park of Sir Baldwin Leighton, thedirect descendant of its Norman lords.

Clun Castle, described in an inquest dated 1272, in the muniment room at Powis Castle as "a certain small castle competently built," having without it "a Bailey, enclosed with a ditch with a certain gate begun in the wall, and in the same Bailey these houses, to wit, a grange, and a stable, and a bakehouse." Fragments of a similar square Norman Keep to that of Wattlesborough, and portion of outer round towers and curtain walls, still exist. The Fitz Alans of Clun and Oswestry held considerable grants of land of the Crown for military service, and The Honour of Clun is one of the most extensive in Shropshire ; its Forest in the reign of Henry VIII. contained 1700 acres.

Another square Keep Tower only remains now to mark the somewhat singular site of *Hopton Castle*, in a valley surrounded by hills.

The site of *Bishop's Castle*, formerly called Lydbury Castle, is now occupied by an hotel with a bowling-green within the old walls of the keep; but in the British Museum is a sketch showing it to have been a structure of some dignity and importance. An outer court is, indeed, surrounded by a wall of no great strength, and with but few turrets of defence, and the gateway and some buildings within the court of almost ordinary domestic character ; but the inner castle is represented as bristling with towers. A gateway, flanked by circular turrets and high curtain walls, with large circular towers at the angles, seems to enclose a massive square keep, with pronounced corner square turrets, the whole profusely battlemented. It was built by a Bishop of Hereford to guard the great episcopal manor of Lydbury from the Welsh. The manor of Lydbury, 18,000 acres, was given to the Church of Hereford by one Egwen Shakelead, in return for a miraculous cure of palsy at the shrine of S. Ethelbert, before the Norman Conquest. In 1530 Leland visited this castle, and says, "Bishop's Castle is well menteined on a slope of rocke, not very hy."

Whittington Castle, held with Alberbury by the Fitz Warrenes, of the Crown, according to a sketch taken in 1760, had five round towers, capped by corbelled parapets, crenellated with battlements projecting from and defending the walls, and a moat surrounding it. At present a fine gate-house, with the entrance archway flanked by circular towers, is all that remains of this stronghold, which was built by Fulke FitzWarine, although a previous castle occupied the same site as early as 843. The same family for nine generations, each bearing the name of Fulke, continued its possessors until the death of the last Fulke FitzWarine, in 1615.

The remains of *Red Castle* are one lofty tower and some other smaller ones, picturesquely situated on a high rock in the Park at Hawkstone. A well shaft was carried through every story, with openings on each floor, that a bucket might be stopped whenever wanted. The castle was first called Radcliffe, in consequence of having been built upon a rock of red stone. It was built by Henry de Aldithele, in the reign of Henry III.

Acton Burnell was another "goodly manor-place and castel," four miles from Shrewsbury. It was probably erected before 1292, in the reign of Edward the First, by his tutor, Robert Brunell, then Bishop of Bath and Wells, Lord Treasurer and Lord Chancellor, under a licence to crenellate his new house, and cut timber in the King's forest for the building. Its style is considerably later than that of Stokesay, which we have minutely described. Its general form is a parallelogram, about 95ft. by 60, with a square tower at each angle. It had three stories, the hall occupying the two upper ones on the eastern side. It contains three large transomed windows of two lights, with spherical triangles in the heads, and seats in the jambs below.

The above list and particulars of the ancient and interesting crenellated manor-houses of Shropshire we have appended to our description of the better-preserved ones of Stokesay and Broncroft Castle, and are indebted for them to an anonymous and scarce work entitled "The Castles and Old Mansions of Shropshire," published by Messrs. Leake and Evans, of Shrewsbury, but which we fear is now out of print. It is profusely illustrated with drawings by the anastatic process, better in intention than execution. We may, perhaps, on a future occasion seek the same guidance to the later but valuable examples of the timber-constructed mansions of more peaceful times in the same locality, and in taking leave of these castles quote the following remarks from the preface of the work we have consulted.

"The keep tower and the hall were the distinguishing features in the Norman castles; in the latter the family dined, while the vassals congregated round its central hearth during the day, and on its floor they slept at night. The earliest specimen of a baronial hall in any state of preservation in Shropshire is that of Stokesay Castle, which was in existence before 1290. In the 14th century, the dining-room had begun to supersede the hall; the necessity for a large number of dependents had ceased, in consequence of the establishment of independent traders and workmen. Serfs were no longer fed at their masters' tables, and the more tranquil state of the country when the Wars of the Roses had terminated rendered it no longer necessary to have a band of retainers on the spot, and guests were not accompanied by so many followers."

THEORY OF THE ARTS.

(*Continued from page* 4.)

THERE is a singular impression of unity pervading the civilisations of the ancient world that it is impossible to avoid being struck with. As Guizot, the great French historian, observes, they seem to have emanated from a single idea — a dominant principle which has determined the institutions, the creeds, and social developments of their several communities, resulting in a remarkable homogeneity and simplicity. In Egypt, India, and elsewhere in the East, the *theocratic* principle has predominated, reproducing itself in the customs and monuments of the people; elsewhere the democratic element has preponderated, as in all the republics of Asia Minor, Syria, Phœnicia, &c. In other cases, the domination of force or the military principle imposed itself upon society, its laws and arts. This unity of civilisation has produced different effects. In some cases, as in Greece, producing rapid development; in others, an unprogressive and stationary condition, as in Egypt and India. Further, this character of unity has been unmistakeably stamped upon the works of art of these early civilised nations; and it is to be remarked that so long as this principle of unity co-existed in the mental, moral, and physical conditions or activities of a country or people, so long was art capable of development; while a disturbed balance of these powers either quite upset that very mental process of embodiment or expression, or, ignoring the ends of art, made it dull, expressionless, and stationary. Now, during the declining years of the Roman Empire, these three great powers were entirely subjugated by the one dominant idea of conquest and mere physical force; and even during the preceding periods of regal and republican Rome, the balance of the three powers I have alluded to was seriously defective, the moral and intellectual elements being sadly deficient. Hence, as we have seen, their art was presumptuous, half deceptive—not as in Greece, real and truthful. The very manner Rome acquired her dominion, by the conquest of towns—the association of municipalities—rendered difficult any attempt to preserve unity or that social bond necessary to organise a great state. It was impossible even for the empire to hold long together elements so incoherent.

The dismemberment and fall of the Roman Empire, the inroads of barbarian tribes, the gradual extinction of Paganism, and the increasing infusion of the spirit of Christianity combined to re-create a new state of things—a new balance of thought and feeling—in short, a new humanity. Henceforward everything is conceived in a different spirit, because the moral and intellectual are no longer in antagonism with themselves or with the physical nature of man. The spiritual and material, or inner and outer faculties, are more reconciled, not in such hopeless confusion as they had been. The conflict of such various elements as now engaged mankind, various powers, principles, and ideas struggling and limiting each other, really produced a vastly different state of society, in Europe at least, to any that had preceded. These various forces in a continual struggle, theocratic, monarchical, democratic, necessarily create a modified condition of society without allowing either one or the other power to dominate, as in the ancient civilisations. This diversity of elements and sentiments is the distinguishing character of modern European civilisation, and is a notable characteristic of all middle-age art as distinguished from ancient. Thus Romanesque art was far more vigorous than either Greek or Roman; more diverse and rich in combination of forms, and more pliant in its uses. The secret of all beauty in ancient classical art was the *unity of idea* that conceived it, and the symbolic expression of its workmanship; while the diverse ideas and complex character of modern civilisation render it much more difficult to arrive at harmony or beauty. To endeavour to attain to the principles or method which will facilitate the process of this result is the object of the present essay. Various degrees and kinds of perfection must now be reached where formerly only *one* degree and kind, limited by the simple requirements and dominant idea of the age was attained.

Christianity gave a new impulse to the moral force of humanity. The various gods of heathenism were rejected; vicarious sacrifice repudiated; peace instead of victory proclaimed, and just those qualities and virtues became valued and extolled that before were contemptuously treated. The sensuous yielded to moral influence. Oriental and Roman licentiousness was gradually replaced by a moral power that began to make itself felt, and a religious zeal was engendered which became more earnest and real as the rottenness of Heathenism and the opposition of its adherents increased. Early Christian art was necessarily sepulchral, the Catacombs affording the chief recluse and resting-places for the martyrs of the new faith. The memorials of this sepulchral development indicate a simplicity of aim and moral power that exercised a marked influence upon early art. The very altar tombs of the martyrs became emblematic of Christian hope, and the sterner and sorrowful images of suffering were always avoided. Symbolism became a means of instruction, and Paganism necessarily supplied many of the symbols. After Christianity became the established religion, art of course assumed a more definite character, partaking, however, of Pagan traditions and ideas. Though painting and sculpture were looked upon with aversion by the early Church—so much so, that in Constantine's time portraits of Christ were rare; yet these arts were made to do service for the new faith. The ancient conceptions, however, were at first appropriated to the new service with a singular judiciousness, to avoid idolatrous tendencies. Yet with all the early simplicity and zeal displayed, the successive phases of the arts enable us to trace the stages of religious development and realisation with peculiar distinctness. Although a purer form of religion now occupied the human mind it was prone to run through the same stages of progress that marked preceding conceptions of religious thought. What was at first a spiritual conception is gradually, by a desire to attach too much reverence to it, converted into an object of idolatry. This was not to be wondered at, for the mind had not attained the power of analysis and perception to distinguish between the objective and subjective. Never before had the spiritual conception the power over mankind it had at this triumph of Christianity over materialistic ideas. Between Paganism and Judaism the new Faith struggled into existence by this intrinsic power of its own, and the very circumstances attendant its promulgation, the persecutions of the Christians, &c., prepared the mind for its acceptance still more at this early stage of the Church. As the Church increased in power and prosperity, this power decreased, till at last we find art allied so closely to religion as to be almost inseparable.

The tendency of the philosophy of the Middle Ages was to re-assert the old theological dominion at the expense of truth and liberty. Thus the philosophy of the Fathers was a blendid Supernaturalism and Rationalism. The two elements were often at variance, showing an unsettled state of thought, and that the period of reconciliation between the material and the spiritual had not arrived, and that the proper balance of the three powers, the physical, intellectual, and moral, had not been satisfactorily adjusted. The new power of a revelation became antagonistic to existing rationalism, and several attempts were made to reconcile the claims of both. Thus the supernaturalist system of St. Augustin found acceptance during the first centuries of the Church, during which period philosophy was subordinate to theology. A blind Realism prevailed, which was in time opposed to a more liberal thought, under the designation of Nominalism. These two opposing systems divided the Church for centuries. As the Church gained ascendancy and established a sort of ecclesiastical despotism, Realism attained exclusive dominion, and philosophy became more allied to theology, and were, indeed, so during the thirteenth and fourteenth centuries, when the arts of architecture, sculpture, and painting, reached their highest religious realisation.

The art of the Middle Ages is, indeed, a truthful reflex of the religious thought and feeling of the period. It was beautiful, grand, symbolic by virtue of the unity and supremacy of the conception that created it.

Whatever our estimate of that conception may be now, it was an approximation to a high moral and social standard, superior to any that had preceded it. Catholicism appropriated all that ancient philosophy had taught, and reo-rganised a social polity founded upon a monotheistic system which was destined ultimately to prepare for the advance of new elements of a definitive order. But beyond this it was powerless as a progressive system, it never having been able to associate itself with intellectual progress.

The æsthetic development of the Monotheistic system of the Middle Ages I must reserve for another paper.

G. H. G.

◆

NOTES FROM MANCHESTER.

(FROM OUR CORRESPONDENT.)

WHETHER the commercial prospects of Manchester are or are not improving, we are not adequately "posted" in the mysteries of the cotton manufacture to say. The iron trades, particularly those in connection with the production of locomotive engines, have been very brisk all the year ; and in some kinds of edifices, especially warehouses and small dwellings, there has been a good building trade. Possibly there would have been a brisker one but for the operations of the trades' unions. It is not encouraging to be told, as we were the other day, that even the iron girders used for the building of the new Royal Exchange in Market-street are being manufactured on and imported from the Continent. This edifice is now cornice high. We are not aware that any views of it have been published; and thus, while from such representations every one is well acquainted with Mr. Waterhouse's Town Hall going up (very slowly) in Albert-square, no one but its architects, Messrs. Mills and Murgatroyd, can say whether the architecture of the new Exchange for Manchester will be good, bad, or indifferent. It would be premature to at present venture upon any criticism of this important work beyond saying that, up to the present writing, it can hardly be considered as possessing a very monumental air. There seems a fatality about all our English Exchanges, whether royal or plebeian. We can only call to mind one,—the old Liverpool Exchange—that rises to the air of anything much nobler or more monumental than a row of shops. Harrison's original "Exchange" at Manchester was not, strictly speaking, an Exchange, being really little more than a news-room. As such it was, like all such edifices of his (witness the Lyceum in Liverpool, and the Portico in Mosley-street, Manchester), both monumental and dignified. The latter work, with Sir Charles Barry's Royal Institution, is doomed, we fear, to be swallowed up in the rage for building warehouses. Peradventure, the old Town Hall in King-street may share the same fate. The portico is a structure remarkable for the soundness of its masonry. We don't now-a-days insert in our buildings blocks of stone fourteen feet long ; but these may be seen in even the plinths of the Portico Library at Manchester.

While, however, we lament the impending destruction of such buildings (and, by-the-bye, insist they ought never to be taken down without the deposit in National or Municipal archives of accurate geometrical drawings), we are far from decrying the sound construction of the Brobdignagian warehouses rising everywhere in their place. These are almost invariably well-designed and soundly-built edifices. It is common enough in London to read of six children being burnt to death, merely because of a house on fire in the Waterloo-road, Lambeth ; but it is by no means a common thing to read, as we did a few weeks ago, of a warehouse being built in the very heart of Manchester without an architect, to the utter disfigurement of the good city, as any one may see who walks into York-street, and observes the vulgar-looking, proportionless pile whose falling cornice occasioned a terrible catastrophe and very remarkable inquest. Nearly opposite this ill-contrived affair is a large stone warehouse in course of erection by the Messrs. Clay, from the designs of Mr. Corson. It is at present too little advanced to admit of fuller description ; but one sees about it everywhere the pencil of the professional architect, especially in the quiet originality with which its details are treated. The style is Italian, with semi-circular headed openings set within spandrels of incised diapering.

Two stone-fronted warehouses are erecting in Portland-street ; one, nearly completed, with the frontispieces of its first floor windows crowned with a kind of panelled pendentive or groin ; and the other a very large building, being erected under the direction of Messrs. Clegg and Knowles, at the corners of Portland and Brook-streets. This building has been in hand for some time. It has a basement of great depth, carried through upwards of 20ft. of stiff clay, excavated with the aid of steam power, and under circumstances of considerable difficulty, to judge from the immense amount of timber shoring required to sustain the outer walls of the substructure on all four sides. It is now ground floor high, and promises, with its ashlar façades and windows arranged in groups of shafted arcades, to be a structure of no common merit.

Mr. Worthington, who is, by the way, about to erect a large Infirmary near Manchester, has just commenced the ashlar facing of a very large warehouse in Quay-street, Deansgate. The style will be Pointed, and the details somewhat massive. Deansgate, once with its offshoots a highly-respectable part of old, or rather "ancient" Manchester, is one of the last of its thorougfares in which one would expect to come upon an ornate Manchester warehouse. The warehouses have, however, come down heavily upon Deansgate and its tributaries; and in its north-western parts particularly many excellent red-brick warehouses, with massive stone doorways of great merit may be seen. The warehouse of Messrs. Henriques and Co., in Cumberland-street, Deansgate, has for example, a remarkably handsome stone doorway. The architects of this warehouse are Messrs. Clegg and Knowles, from whose designs another new warehouse, noteworthy for its two elegant doorways, has been built at the corners of Booth and Fountain-streets. This latter is one of the handsomest warehouses in the city.

"Loyd's House," a large pile of warehouses near Albert Square, will be found very well worth a visit. It has three façades of French Gothic character, treated with great simplicity and good taste. The mode in which the open staircases, with their shafted and foliated stone window openings, are made to harmonise, while they all necessarily vary with the rapid declivity of the side street, struck us as especially commendable. The building has been erected from the designs of Messrs. Speakman and Charlesworth, the architects of two other good commercial works in the city: Lancaster Avenue in Fennel-street, near the Cathedral, and a carriage repository in Devonshire-street, Oxford-road. These are both works of little stone and much brickwork, but each of them masterly in its way.

Little by little, the approaches about Albert-square are being improved—old corners of streets are being taken down, set back and rebuilt. In this way a large slice of Bond-street, by Cooper-street, has been wholly carried away ; and a new fronted building of passable Italian architecture has been thrown open to view. On its opposite side is a row of shops and chambers of no small pretence, but very unsatisfactory proportions ; better, far better, than its more pretentious and worse-proportioned neighbour, the Freemasons' Hall, but hardly up to the mark of a Manchester trading façade. It is too *comprehensive*—"not to put too fine a point upon it"—for the inadequate site placed at the disposal of its architect : for it has had an architect, which, by-the-bye, is more than we can predicate of one London building in a hundred. Somehow, it strikes us that, although the Mancastrians will doubtless do everything that can be done by good building all round it, Albert-square will never be a handsome *Place.* The new Town Hall will be unquestionably a very handsome edifice, but its serrated skylines will ill accord with the square-shaped, many-windowed, tall cubical blocks of warehouses by which it will very probably be surrounded on all sides. It is a structure that, to have fair play, needs foliage by day, and by night will need lively-looking, be-curtained, and illuminated windows of *inhabited* rooms to keep its quasi-domestic character in countenance. Good architecture will effect wonders ; but it will not, when the citizens have shut up their handsome warehouses, and left the smoky town to itself, make the Mayor's parlour a very lively place to look out from at night, or o' Sundays ; nor will it then make a very cheerful background to the edifice itself for the visitor to look at. We commend the idea—and be hanged to it for its extreme gloominess!—to the able architect of the building. Perhaps he may do something to induce his *quondam* fellow-citizens to build dwelling-houses or shops along the adjacent streets, and—what is more to our purpose—to dwell in, or over them, with their families ; as their forefathers used to do in the days when St. Ann's and Marsden-squares consisted of nothing but dwelling-houses, and were each planted around with poplar trees. With the Editor's leave, we must enlarge a little on this theme, for it would really seem to have a trifle to do with the question of Gothic or Classic. No one for a moment would put Mr. Waterhouse's spirited Town-Hall on a par with the dismal, dry, deadly "architecture" of the Royal Infirmary, on whose long-porticoed façade a sunbeam is never seen to fall ; and yet, though the trees are all gone (or as good as gone) the Infirmary and its site—largely made up of warehouses—is always interesting. The Infirmary site is confessedly a superior one to Albert-square, but the argument remains good for all that—that is to say as far as it goes, which is this : to wit, that if citizens will not live and sleep in their city, but will nightly and o' Sundays shut it up *like a tomb,* it is very questionable whether, in the building of their Town-hall, they had not better house their mayor in an edifice of Greek, Roman, Egyptian or other *monumental* architecture, than in a picturesque Gothic shrine, out of all keeping with its melancholy background of shut-up shops, and of what is even more tomb-like and gloomy, shut-up warehouses. It has become quite a common remark that of a Sunday or an evening Manchester proper resembles a big tomb or city of tombs, horrible to walk through. The city of London is very fast falling into the same condition. Here is a question for the Aryans and the Mediævalists to cogitate upon.

The warehouses and commercial buildings of Manchester are enough of themselves to occupy an entire article. If a collection of even the doorways of these buildings were to be published, it would put to shame—not the architects, for no one *in* London employs architects as a rule, but—the commercial buildings and speculating builders of the metropolis.

There is a dearth of public buildings beyond the two large ones already mentioned. Messrs. Hansom's large church of The Holy Name, in Oxford-road, is considerably advanced, but not yet ready for the roof, though it has already reached a very commanding height of masonry. Its outline is unquestionably picturesque. Owens College, in its neighbourhood, is commenced, but not yet risen out of its foundations. Hard by it Mr. Woodhouse, the architect of the elegant Wesleyan church at Longsight, is about to erect a new congregational church.

House-building of a small class is very brisk in the environs of the city. There is a prevailing rage for octangular bay windows all over the town, these appendages being introduced into even weekly dwellings, disposed in long rows side by side and *vis a vis,* with utter disregard of seclusion or privacy of any kind as elements of comfort. We wish we could record an improvement in the planning of the backs of Manchester dwelling-houses, but we cannot. It would seem that with the greater pretentiousness of the fronts has grown up a still more contracted allowance of space to the back yards ; nor is the evil—always peculiar to Manchester house-building—restricted to the dwellings of the poor. It extends, and that in a more remarkable degree, to the dwellings of the better classes—to houses of £40 and £50 a year, which in Manchester is considered a tolerably high rental. The midden system still exists, but has lately been severely discussed by the authorities, and some measures of amelioration have been adopted. If the earth closet system *is ever* to prevail anywhere in England, Manchester would afford a very fit field for the energy of its advocates.

◆

Mr. W. Deane, late of the Institute of Painters in Water Colours, has been elected an associate of the Society of Painters in Water Colours.

Worksop.—A new reredos is about to be fitted up in S. John's Church, Worksop, as a memorial to the late Mr. G. S. Foljambe, of Osberton. Three designs were submitted to the committee, viz., one from Mr. Clarke, of Nottingham (architect of the church), one from Mr. Thompson, of Nottingham and Ollerton, and a third from Mr. Theophilus Smith, of Sheffield. The last-named design was selected.

LAUNCHING OF A GREAT CAISSON.

FIG. 1

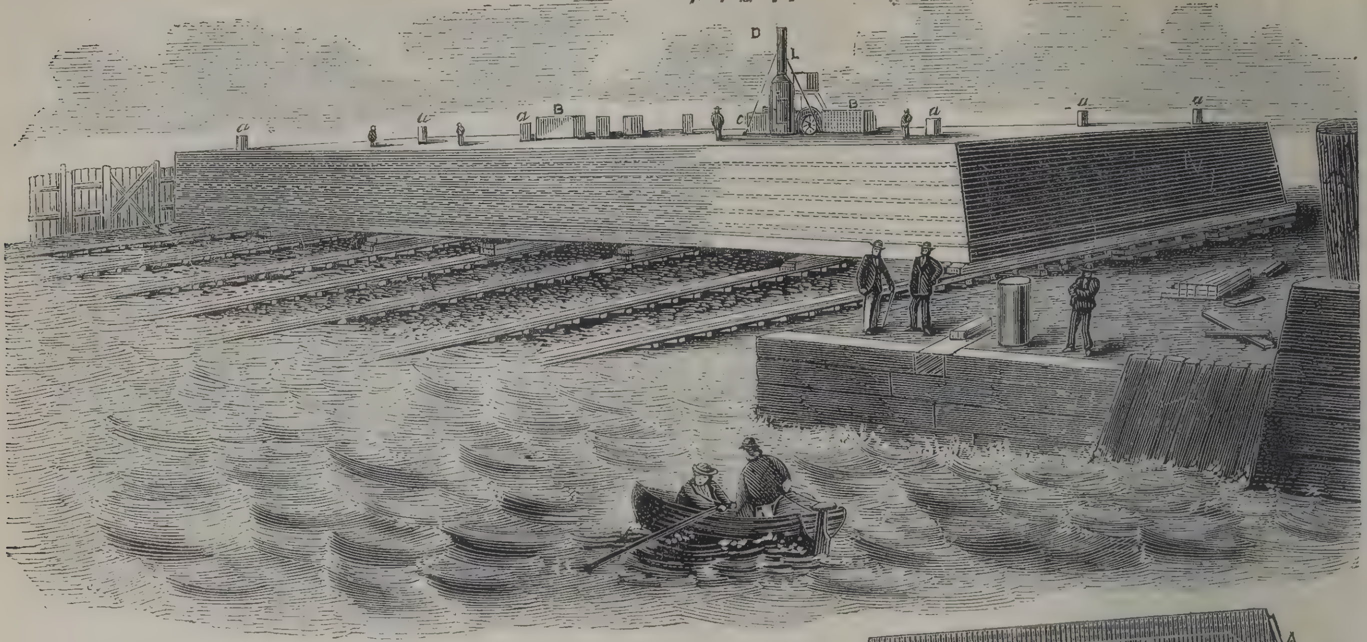


FIG. 2

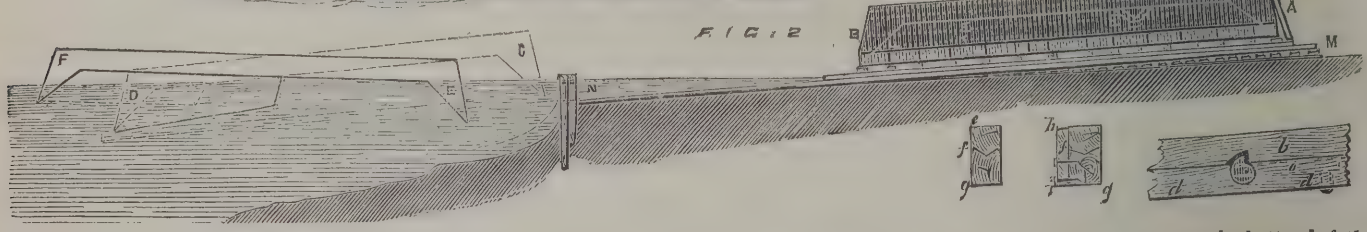

FIG. 3

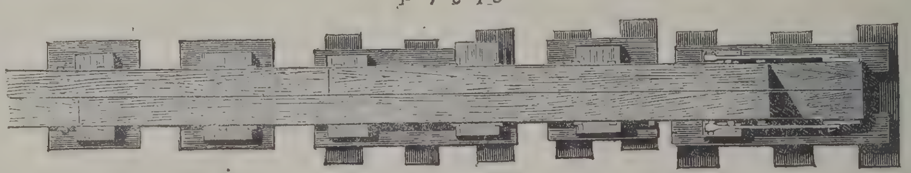

FIG. 5

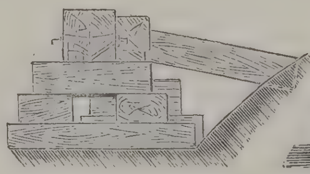

FIG. 4

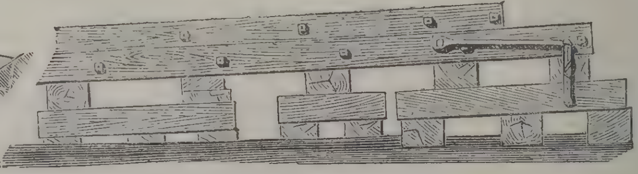

THE launching of the caisson for the Brooklyn terminus of the East River Bridge, says the *Scientific American*, which was quickly and easily accomplished on the 19th March of the present year, was justly considered a noteworthy feat of engineering.

Our engravings show the caisson on the ways, as it appeared when ready to be launched, and also some details by which the construction of the ways and the plan of procedure in making the launch may be comprehended.

The structure was put together with its longer side parallel to the river bank, and about 100ft. distant from it, and the ways upon which it rested were seven in number, and each about 180ft. in length. These ways were laid in such a manner that their upper faces were curved to a radius of about 312ft., and at a slope which made the chord of this arc form an angle of about 5°, the curved sine of the arc being some 13in., and the upper ends of the ways 15·6ft. higher than the lower ends. By this means an accelerated motion was given to the caisson in the latter part of its transit; the increased velocity it thus obtained enabled it to overcome the great resistance it encountered from the water when it struck the river broadside on. The details show the form given to these ways, and it will be observed that they rest upon cross and longitudinal timbers; the letters *f g* refer to the bearing pieces of the fixed ways, and *e f* to the sliding ways attached to the underside of the caisson. The surfaces of the former of these were cut to an angle, as shown, that of the corresponding slide being made to fit, in order to insure a perfectly true motion of the caisson in the process of launching. Besides this, timbers *h l* were bolted to the inside of the two outer ways, which projected above the sliding surface, in order to check any swerving tendency. To insure a means of casting loose the caisson from every point at the same moment, a check cam, shown in the detail, was fixed into each of the ways near the upper end. The cam at the point where it took the bearing of the sliding way was provided with a projection which held it fast against the timber, and it was kept immovable by means of a lever secured by ropes at its extremity. These ropes being cast off simultaneously, the cams were thrown over, and the caisson was free to move equally throughout its length. The position of the caisson upon the ways when ready for launching is clearly shown in the figures. The position of the air chamber is indicated by the dotted lines, H K L, and at E is shown a partition, which was constructed to divide the air chamber and prevent the air from any sudden movement from one part of the caisson to another, which would have affected its stability. The dotted lines C D show the position assumed by the structure just as it left the ways, and E F represents it after it had been launched and had come to rest in the water.

The caisson inclosure extends some 250ft. along the river front, thence back about 300ft. The caisson itself has a frontage on the river of 168ft., and a depth of 102ft., the basin in which it is being sunk extending a few feet more in each direction. The caisson is, in effect, a box made of heavy timbers, 16ft. in depth, and divided by like heavy timbers into six compartments. This great compartmented box, without a cover, was turned bottom upwards and floated over the spot which it now occupies. Several layers of timber were then securely bolted over the entire upper surface, increasing its already immense strength, and sinking the structure until its sharp edges—protected by heavy iron plates—rested upon the bottom of the basin.

The problem was, and is, to sink this enormous caisson through mud and earth and boulders 40 or more feet, until a firm ground is reached, there to leave it as the foundation for the immense towers of the bridge that is to be constructed. This is effected by maintaining and constantly changing an atmosphere, and at the same time excluding the water from each of the compartments of the caisson: thus furnishing means for carrying on the work of excavation to the best advantage. The means to this end are a supply of air forced by steam-driven pumps through pipes and hose into the caisson chambers, and a sufficiency of weight on the upper surface of the caisson to counteract the buoyancy alike of timber and air, and maintain the caisson at all times firmly on the bed of the excavation. This weight is provided by commencing at once the erection of the towers. For this purpose the entire surface of the caisson is covered with blocks of heavy stone, the interstices of which are filled with the best cement. As the caisson sinks, other tiers of stone will be added, and when it rests upon its final bed the towers will be carried up their full height.

◆

Architecture at the Royal Academy.—The Royal Academy has resolved to entirely re-model its Architectural School. Owing to want of space when in Trafalgar-square, the Academy was prevented appropriating any special room exclusively for the teaching of architecture, but the removal to Burlington House has enabled it to provide a large class-room, fitted up specially for the purpose. Mr. Phené Spiers has been appointed master of the school, and has been instructed to proceed to Paris to make himself thoroughly acquainted with the present system of teaching adopted at the Ecole des Beaux Arts. The new arrangements will be ready for the opening of the coming winter season.

Furniture & Decoration.

UTILITY IN DECORATION.

IN treating of the theory and practice of modern house painting and decoration in these pages, we have not hitherto spoken of the utilitarian aspect of the question, a very important question to the majority of people, and necessary to be understood both by the decorator and the public.

It appears to us that, apart from the abstract opinions of this or that person as to the desirability of using imitations of woods and marble, or any and every of what are called shams, we are bound to take into consideration the usefulness and lasting properties of certain imitations, and their suitableness to the purposes they are used for, and for which they are best adapted. For instance, there is an imitation of stone on wood which is so good that no one can discover that it is not stone except by sounding or striking it, and we have known it to stand good when exposed to the weather fully 20 years, and at the end of that time be almost as good as at first. This effect is brought about by throwing common sand, or the sand from any particular kind of stone upon the paint when it is wet, in this wise:—The woodwork is well painted with four or five coats of oil paint. The finishing coat is mixed with white lead, boiled oil, and a little copal varnish, to give it "tack" or stickiness; it must be, of course, stained to the particular shade or colour of the stone you wish it to resemble. The colour is now laid on the work in the ordinary manner, and the sand is thrown upon it while it is wet. The sand may be thrown on the work from a common tin dredger, that is, a tin can about 3in. in diameter, with a perforated lid, exactly like the flour dredger of our kitchens. We believe there are machines made for the purpose, but the dredger answers the purpose very well. Care must be taken that the work is well covered, or else there will be more on one part than another, which will cause it to look shady; it is always best to throw as much sand on the work as it will hold, to make sure it is well covered, and if paper is placed under the part operated upon it will catch all the superfluous sand, so that there need not be any waste. The work should now stand for a few days, until the paint gets hard, the loose sand may then be brushed off. Now, if this is well and carefully done, it will have all the appearance and feel of stone, and will last for a long period without being re-done, but of course may be re-done at any time at a light expense. It is sometimes painted after being sanded, but if properly done it is much the best to leave the sand unpainted.

There are, of course, several kinds of sand which may be used, or the small pieces of any particular kind of stone may be broken into sand and used. By doing different parts of the work at different times, various colours of sand may be used, which has a good effect. If we are doing a column or pillar we might do the shaft with the sand of the red Mansfield stone, and the capital and base of the Yorkshire or Bath stone, or any other light-coloured sand, or in rustic work the stones might be done alternately. It will be understood that plaster or cement pillars may be done in the same manner. Now, here is an imitation of stone, simple, useful, and effective—having serviceable and lasting properties superior to any other method of covering and preserving wood.

The sand forming an impervious coating (in fact, it is a coating of stone, having this advantage over stone, that it is non-absorbent of wet or damp) the uses of this process will be evident, especially in districts where stone is not to be had except at great cost of carriage, and also in many country districts, where wood is plentiful and stone is not. It will be said by the realists, "Why not leave it as wood? Don't cover it and make it appear like stone, which it is not;" to which we may answer, that wood, especially when exposed to the weather, alternate heat, wet, and frost, soon becomes split up into innumerable cracks, and its surface gets rough and unsightly, its colour dirty and black; nail holes, and the rust from the nails become unpleasantly visible, and ultimately rottenness and decay in numerous forms set in, and it becomes unsafe, and has to be taken down and replaced with new wood. Now if the wood is done over as described, all this is prevented, the wood preserved, and always pleasant to look upon. It will perhaps be said, "Why not varnish the wood, and then it will resist the effects of the weather?" It is quite true that if the wood is well varnished it will stand for a time, but how long a time? If it is outside work, varnish will not stand above two or three years, even with the very best varnish. The heat of the sun dries up and exhausts the oil of the varnish, and when that is gone the gum shrivels up, cracks and turns white, peels off, and thus perishes, consequently the wood is left without protection.

In these cases artistic taste and love of the beautiful may induce us to leave the wood uncovered, but utility and common sense bid us cover it up, and thus preserve it. We remember some 30 years ago examining some exquisite carvings in oak and pear tree wood, which were rapidly falling to decay—worm-eaten and rough on the surface from the effects of dust, time, and neglect. We suggested that some means should be taken to arrest the decay, and thus preserve such beautiful and valuable works. The gentleman to whom they belonged rose up in arms at once at the bare suggestion. It no doubt seemed to him a profanation to touch them with any vile composition. As the artist had left them so they should remain, fresh from the chisel; a very proper feeling in many cases, but in this case, when it was so evident that Father Time was using his destructive chisel with such fatal effect, we ventured to differ, and after much persuasion we induced him to allow us to try what we could do with part of the work. Our first efforts were directed to the cleaning the carving from the accumulated dust of years, which we did as well as we could by first blowing all the loose dust off with a pair of house bellows; we then used small hog-hair brushes, and by supporting the weak parts with the hand we managed to clean it well without injury to the most delicate parts. We then used the bellows again to blow off any remaining particles of dust from the interstices and undercutting. When it was as clean as we could get it, we placed it in a tub large enough to hold it, and then filled the tub with the purest linseed oil we could procure high enough to cover the whole of the carving; we let it stand in the oil for 24 hours, and when taken out we cleaned off all the superfluous oil with large and small hog-hair brushes, wiping the oil out of the brushes as we used them, until there was not left sufficient oil on the surface to form a skin. This is a very important point in the process, and requires great care, otherwise the carving would be spoiled. The oil darkened the wood a little, but not so much as would be supposed, the oil being free from litharge or any other dryer or colouring matter. After 20 years had elapsed we again saw the same carvings, and we found that those which had been treated in the manner described were just in the same state as when we left them 20 years before, but had become so hard that a sharp knife would hardly touch them; but those which had not been submitted to the same process were in some parts irretrievably gone, and the rest were rapidly following. Now we hold it to be unwise, and, in fact, almost a crime, to allow these beautiful creations of man's genius to go to decay and be destroyed for the sake of a prejudice or rather an obstinate persistence in what is evidently a mistake. Look at the exquisite gems of art left us by Grinling Gibbons, and others, which are dropping to pieces and crumbling away simply for the want of some such means being applied to preserve them. Would it not be better a thousand times over to sacrifice some little of their beauty than to see them as they are? Of course we would all rather see them untouched, as they were left by the artist; but common sense steps in and points to the fact that however beautiful these things are, and although they may appear, and, in fact, are more beautiful left as they are, yet the material of which they are composed is so perishable that they must of necessity soon decay, and all the labour, and skill, and thought employed in their production be lost for ever, except some means be taken to stay the hand of the destroyer. We are surprised that the remedy has been so long delayed. We do not advise varnish or polish to be used; the process we have described does not produce that result, but leaves the wood nearly dead—that is, without gloss; although there is no better polish for wood than linseed oil itself. If a mahogany or oak table be regularly rubbed for years with pure linseed oil, the polish which results is the best and most indestructible that can be produced, and becomes so hard in time that scarcely anything can injure it. We have digressed somewhat with regard to carvings, but we hope not fruitlessly so; and trust that this brief notice may call attention to the subject, and help to a remedy.

Imitations of woods and marbles may be classed amongst the useful arts. There are thousands of English homes in the construction of which no other wood is used but the common spruce pine, full of ugly resinous knots, and which, for that reason and many others, has to be painted and puttied to make it passable. And if we could use real oak and mahogany for our doors—that is, if it were cheap and plentiful enough for that purpose—it would not be wise to leave it unpainted, as it would require so much time and trouble to keep them bright and clean, that nine-tenths of the world could not afford the necessary time and cost to keep them in order; consequently it is not only more convenient and economical; but it is really better to have painted woodwork in the majority of our houses—better because woodwork painted, grained, and varnished is the most cleanly-looking and serviceable method of decorating the doors and other woodwork in all those rooms in our houses which are most used, or which require to be done so that they will not easily soil. For we cannot always dwell in a china shop, and must have some rooms where we can move about at our ease, and where we are not continually afraid of spoiling something. Now for this purpose nothing can be more appropriate or better adapted than imitations of wood, well done and well varnished. Its lasting properties are very great, and at any time a wash down and a coat of varnish makes all new again. For public buildings where real oak or mahogany is not used, we cannot substitute anything equal to it. If we paint them in dark low-toned colours, and varnish them, they will not last so long, nor look so cheerful, nor so appropriate, for even the objectors to imitations of all kinds will agree with us that wood painted in imitation of wood is much more in accordance with good taste than if painted in any other manner. If we were to paint a door in imitation of marble, we should be committing an offence against good taste and good sense, notwithstanding that there are real marble doors, of which the Russian malachite doors in the Great International Exhibition of 1851 were examples; but if we paint them in imitation of wood, we do not offend our sense of propriety, simply because it is wood, and has the structural character of wood. If we were to paint a column, or a pillar, or pilaster, or a plastered wall in imitation of wood, we should be doing wrong—we should err in judgment, in taste, and against structural propriety. We do not here mean that a stone pillar or column should be painted, but we build our columns and pilasters of brick and cement, as 99 out of every 100 are done.

In the interiors of our dwelling houses and public buildings there cannot surely be any impropriety in finishing them in imitation of stone or marble, of which materials they ought and would be built of if they were only cheap enough. The utility of the practice is unquestionable; that it is economical is proved by the fact that if once properly done, and ordinary care taken of it afterwards, it will last and wear almost any length of time. We ourselves have seen work of this kind which had been done upwards of 50 years at the least, and with the exception of its colour being a little darker than when it was first done, it was in other respects quite as good as when newly done; this very fact alone is a sufficient proof of the legitimacy of such methods of decoration. What can be better adapted for a public staircase than a good imitation of one of the granites, grey or red? If well done and well varnished it will last for scores of years, and will wash and clean with little trouble, and although thousands of people may pass up and down the staircase, its serviceable qualities are so great that it will suffer no great harm. In this case we, of course, only mean that the granite should be done up to a certain height for purposes of utility. The upper part may be painted or ornamented in any suitable manner, either in distemper or oil colour. We shall find that there is a suitableness and an unsuitableness in the application of decoration to special purposes, and that independently of any abstract views we may have in regard to beauty, or this or that style, we are bound by the circumstances of any particular case to consider not which would be the most beautiful, but which will best combine beauty, usefulness, and durability. For instance, we had occasion a few days ago to go into a first-class shop in one of our principal streets, in which the counter front was painted in imitation of walnut wood, and the mouldings were part black and part gilt. The gold was in a very dilapidated state, scratched, and rubbed quite bare, and injured by the continual dusting and cleaning necessarily required in such a situation. The gold being upon the round beads (which were the most prominent members of the mouldings), was of course most exposed to wear and tear, and soonest spoiled, and there is nothing looks so bad as gilding when it has got into such a state. Now here a great mistake had been made. The principle of utility had been entirely lost sight of and sacrificed to the vulgar desire for glare and glitter. Had the decorator been content with his work without adding the gold to it he would have produced a very successful work, and one which would have been serviceable, quiet, and good, instead of which the reverse was the case. As a matter of taste we object to gilding on grained woods; the two do not assimilate, and seem to have no connection with one another. If the work were real wood polished, we should never dream of gilding any part of it. There is really no necessity for it, and it is, therefore, superfluous. In the choice of paper hangings, furniture, carpets, and other aids and necessaries for our comfort and happiness, we are bound to take into consideration utility as well as beauty.

◆

THE BEST METHOD OF PREPARING MORTAR.

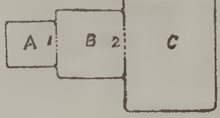
THOUGH many of the accidents which are constantly taking place from the weakness in construction of our buildings, are rightly attributed to faults in the original plan, and the incompetency of the architect, it not unfrequently happens that a large portion of the blame should be placed upon the builder having the immediate charge of the work, and under whose supervision are conducted those minor details in construction upon which depend to so great an extent the stability of the whole. Walls may be made of insufficient thickness and yet stand for a long time if the masonry be good; and, again, they may be heavy enough in the plan and fall when built if the mason do not thoroughly understand his business. In such a case blame is often attached to the architect when an accident occurs, which should in reality hang upon the skirts of the builder. Upon the quality of the mortar used in construction depends, in no slight degree, the strength of the walls; and regarding the best method of mixing mortar, it is proposed in this article to offer a few suggestions.

The common mode of making mortar is to first put the lime to slack in a box prepared for the purpose, and, after the slacking has continued for a time, to mix with it, in the same box, sand which has been previously screened. The mixture thus compounded is afterwards shovelled out of the box into a heap; and as mortar is required for use, a portion of this heap is drawn out and tempered to the proper consistency. In mortar prepared in this manner the mass is rarely homogeneous, lumps of unslacked lime and portions of gravel occurring promiscuously throughout the whole.

The proposed improvement (says the *American Builder*) in mortar-making provides an entirely different mode of operations, and, it is believed, obviates all the evils attending the present system.

The plan to be adopted, which, in the estimation of the writer, is at once the most thorough and the most economical, is as follows:—

Three boxes, A, B, and C are first constructed, the box A being higher than B, and the box B higher than C. These boxes are connected by passages 1 and 2, at which are placed screens, such as are ordinarily used in mortar-making. Into the box A is put lime for slacking, and there mixed with water and manipulated until it has about the consistency of cream; after which it is allowed to run through the screen 1 into box B. It should be premised that, while the process is conducting, boards are placed over the screens 1 and 2, and removed only when it is desired to unite the contents of different boxes. After the lime has been admitted to box B, unscreened sand is thrown into the box in quantity deemed sufficient to make the mortar. The sand and lime, thus mixed, are then run through the screen into the mortar-bed C, and there allowed to stand for 24 hours, when the mortar becomes fit for use, and reqnires no further tempering or mixing before its application.



The advantages of the above method are very apparent. In the first place, about one-fourth less lime is required than in mortar made in the usual way, and the mortar is more thoroughly mixed—and, therefore, much better—than that dealt with by the common process. Again, since the different boxes are separated by screens, the preliminary labour of screening is entirely avoided, all the lumps of unslacked lime being retained in box A, and all gravel and foreign matter in the sand is retained, in a similar manner, in box B. After the mixture is finally run into the mortar-bed, all the refuse matter remaining in A and B can be shovelled out, and the boxes made ready for a repetition of the process. While the mortar is running into box C, lime can again be slacking in box A, without loss of time, until the mortar bed is filled. The bed C can be made of any dimensions to hold the mortar required in the conitruction of a large building. In regard to the quality of the mortar made by the above process there can exist little doubt. It is more easily applied, more durable, and better adapted for all kinds of work than that made in the usual way. The writer has followed the system for many years, and has continually greater reason to be satisfied with its decided superiority.

CIVIL ENGINEERING AT THE TIME OF CHRIST.

THE Roman genius for construction was the grandest the world has seen. The traveller visits the cathedral fanes of York and Bourges, Burgos and Seville, Cologne and Milan, the castles of Windsor aud Heidelberg and S. Elmo, the temples at Pæstum, at Athens, at Baalbec, and at Thebes, the palaces of the Maharajahs, on the banks of the Ganges, sees monuments of splendid beauty, unsurpassed in any age, by any people; yet he returns to Rome, and says, while standing upon the vaulted ruins of the baths of Caracalla, or while counting his steps across the floors of Constautine's Basilica, or while looking down from the utmost tier of seats into the arena of the Coliseum, that the constructive genius of all the rest of the world must bend before the Imperial Latin Engineer.

Never but once were thus conbined in the political situation of a city all elements needful for carrying up the culture of mere building talent to the highest pitch while at the same time were offered unlimited opportunities for its exercise. Rome was a seaport; backed by a country fertile in supplies, a peninsula of mountains made of marble, in the centre of a vast sea, crowded with well-settled islands, and girt about with coasts inhabited by the oldest and most advanced communities of man. The Roman States were still physically undebauched; in the prime of its strength; irresistible lord of all the Western and half the Eastern world; was infinitely rich; irresponsible and unscrupulous; proud and vain; sensual and sensational; loving war only for the sake of its fruits, and preferring peace for the sake of its enjoyments. The Bath-house was the church of Rome, combining the essential qualities of the Exchange, the Club, the Museum, the Bar-room, and the Polls. The Emperors cnriched themselves and confirmed their power by watering their political stock. Caracalla could afford his horse a golden manger in a temple of its own, after affording his fellow-citizens a Bagnio as large as the Tuileries, in which ten thousand bathers could enjoy themselves at once, the ceilings of which were 80ft. high, the partition walls as massive as the abutments of a bridge. The sweating-room alone was larger than the Catholic Cathedral in Philadelphia, and surrounded by arcades, inside, of costly Corinthian columns, the abstraction of which by the mediæval princes of modern Rome for use in the construction of their private palaces brought down the ceiling with a crash which shook the city as far off as the Castle of S. Angelo.

S. Peter's is built on the model of these ancient monuments. Its nave is precisely of the size and shape of the great room in the Baths of Diocletian and of the name of Constantine's great church. Its dome is precisely the size and shape of the Pantheon, which, as is now well known, was yet another Imperial Bath-room, since then appropriated to the uses of religion—merely a change from hot to holy water. The great Bath-room of Diocletian is also one of the grandest churches of modern Rome.

The necessity for supplying an amphibious population with floods of fluid developed the civil engineering talents of the Empire. Scores of aqueducts were constructed above ground to bring the waters of the Appenines into the city, and an elaborate system of sewerage carried it away again to be re-purified in the bosom of the Ligurian sea. While Signor De Rossi has been excavating the ancient catacombs outside the walls, and the Government antiquarian, Baron Visconti, the ancient marble yards and police stations inside the walls, and the Emperor Napoleon the foundation rooms of the Palace of the Cæsars, the British Archæological Society of Rome has been digging along the foundations of the ancient walls themselves, and opening up the underground water-works, reservoirs, and sewers of ancient days. They have determined the true site of the fountain of Egeria and of King Numa's Palace; how Royal Rome, Republican Rome, and Imperial Rome were in succession fortified with longer and larger circumvallations; and how the water pipes of the engineers of the Middle Ages were ranged within and upon the conduits of Servius Tullius aud the Tarquins. Any civil engineer who is curious in such matters, or would like to see nice pictures of the rubble work of his predecessors in the profession twenty-two centuries ago, can gratify himself by looking over Mr. Parker's "Notices of Recent Excavations in Rome," just published in Part I. of the forty-second volume of the *Archæologia*. By-the-bye, Mr. Parker's little hand-books of architecture are not only indispensable for the tourist, but ought to be in every American gentleman's library. And it is worth knowing, also, that the Archæological Society, which the foreigners in Rome keep up, has upwards of a thousand special photographs of specimens of Roman construction, arranged in the order of time.

The first part of this interesting collection is already for sale, and illustrates the historical construction of walls in a series of sixty-four examples, beginning with the wall of Romulus, 750 B.C., and taking on the average one for each generation. The series is continued down to the 13th century A.D. In the time of the Empire the dated examples are so numerous that they are necessarily subdivided ; afterwards the churches and monasteries supply us with a continuation of the series. This is really a great work for the history of architecture, such as has never been done before. Even D'Agincourt, in his admirable work, overlooks construction, which is the foundation of all. It is sometimes impossible to get photographs from nature from want of sufficient space, and it is generally necessary to fill up the excavations again immediately, so that plans and drawings are the only mode of showing what has been made out ; but photographs are made of these and sent to the Oxford Architectural Society.

When will we have in Philadelphia an Architectural School, liberally endowed by private munificence, furnished with a splendid library, folios of drawings and photographs of all the monuments of all ages, and taught by artists of merit and learning, and by engineers of rank, genius and experience?—*R.R. Journal and Mining Register.*

BEAUVAIS CATHEDRAL.

OUR illustration is a reproduction of a picturesque sketch of the Cathedral at Beauvais—one of the finest examples of 13th century work in France. Its beauty, however, though great, is incomplete, there being neither nave nor steeple. The steeple was destroyed by a tempest in 1574, only ten years after its erection, and this accident prevented the completion of the church. The choir is of great beauty, and has the appearance of being more lofty than that of Amiens, though in reality it is not so. The see of Beauvais was one of great importance, and the town itself occupies a conspicuous position in history as a fortified city of great strength.

THE WORKING MEN'S EXHIBITION.

THE general verdict which has been passed upon the show (says the *Saturday Review*) is that it is an interesting one, but that it does not fulfil the purpose which it proposes to itself—*i.e.*, "to stimulate and reward individual skill and intelligence" by separating the results of personal design and execution from the mere results of combined work. As regards nine-tenths of the Exhibition, it is just the old story over again—precisely what we have seen at London and Paris—a vast aggregate of show-cases, shop-fronts, pattern cards, and advertising sheets, all very important to enterprising tradesmen ; but, as regards craftsmanship, we learn nothing, or very little—precisely because there is nothing, or next to nothing, to tell us. It is something for us to feast our eyes on elaborate inlaid tables and costly specimens of marqueterie furniture, but, in the first place, they are not the work of any one workman ; and next, we should have to go to a 'Co." to buy them. If these Exhibitions are good for anything, they ought to bring us face to face and mind to mind with the artificer ; as it is, they refer us to Messrs. Castellani, at Rome, or to some great ironworks in Staffordshire or Newcastle. Even when, as in the matter of Indian embroidery or ivory carving, we have the genuine work of the solitary artisan, he is intercepted by the wholesale house and the importer. Next come the small class of those British workmen who exhibit their own productions in jewellery, chasing, and enamels, in porcelain painting and glass engraving, in stone carving, and other works which may be called artistic. It is to the encouragement of these artistic workmen that our art-schools and prizes have for many years been sedulously employed. But all those who have paid attention to the matter bear testimony to the little results which have been attained. Whenever an artist workman has been educated, or has educated himself, up to a certain and often creditable amount of proficiency, he is snapped up by the trade, and set to work on producing articles of the regulation fashion and pattern, and the the fire of original genius is stamped out of him before it is thoroughly kindled. We spend infinite money on producing our Pegasus, and then set him to plough. Nor must it be forgotten that shopkeepers exhibit the greatest reluctance to allow any communication between a customer and the workman. If by accident one finds a piece of jewellery or an enamel in a shop which exhibits remarkable taste or skill, it is impossible to get at the artificer. An order will of course be taken over the counter, but you can never find out the working man. Intelligence and skill in the craftsman may exist, but the firm keeps this intelligence and skill to itself. What is wanted is, as the programme of this Exhibition professes, union between the employer and the employed ; but the union, to be really valuable, should be a union between the amateur who gives a commission and the workman who executes it. The union which does exist is between the middleman—the shopkeeper—the firm—capital—and the workman, not between the customer and the craftsman. The working man in these bazaars is generally a mere phrase ; the person who profits by them is the shopkeeper ; and it is for this reason that, as the newspapers complain, so little care has been taken at Islington to announce the name of the workman, or at least to announce it with such distinctness that you can get at him, and so much care has been taken to announce the shop where the production may be bought.

LIME BURNING.

THE quarries at Rockland, says the (American) *Architectural Review*, near the mouth of Penobscot Bay, Me., are at present worked on a more extensive scale than ever before. The old-fashioned kiln for burning the limestone has been entirely superseded by the patent perpetual kiln, and a large amount of capital is invested in the business. The kilns are situated on the shore of a peninsula, and are built at the foot of a bank and at the head of a wharf. The kilns are constructed with walls of thick granite, and lined with fire-brick, being eighteen feet square and thirty feet deep, narrowing towards the lower part. Each kiln will hold from one hundred and fifty to two hundred casks of lime, and a charge of limestone rock and fuel is burned in from seven to eight hours, and is drawn three or four times a day, according to the character of the rock. The lime, it is stated, swells in the kiln, and prevents the unburned portions from falling down. When the lower layer is sufficiently burned, iron rods are run into the furnace, and the lime, in large glowing red lumps, is removed by means of long handled shovels, and when cool is broken up, sorted, and packed in casks. The fuel is either wood or bituminous coal, the kilns using one cord of wood or two tons of bituminous coal to produce the same yield. One hundred casks of lime consume in their manufacture four and a half cords of wood. The kilns and the fuel are covered by large sheds, the buildings for a pair of kilns occupying an area of seventeen thousand square feet.

BRICKMAKING BY MACHINERY.

A MEETING of the Manchester Institute of Engineers was held on Wednesday week in the Royal Institution, Manchester, to hear a paper read by Mr. J. F. M. Pollock (Messrs. Pollock, Laing, and Powley, Leeds) on "Brickmaking by machinery." Mr. W. W. Hulse presided.

The paper contained an elaborate description of Pollock's patent brickmaking machine (illustrated by a model). The invention consists of powerful grinding rollers, pug mill, rotary moulding table of improved construction, and a press, the mould or moulds of which are independent of those in the table. A self-acting delivery belt, the driving apparatus of which is constructed on an improved principle, so as to avoid all possibility of slip, and a rotary brush for removing any sharp corners or loose materials from the bricks, are also added ; and there is an improved system introduced for lubricating all sides of the moulds or bricks, in such a manner as to be independent in its operation of the attendant. The moving faces of the machine which have to work against the clay are all of steel, as also are the pug mill, driving wheels, shaft, and knives. When common bricks are required, the press may be thrown out of gear, and the machine may then be worked at an increased velocity. In concluding his paper, Mr. Pollock made reference to those who would hinder the introduction of machinery to supersede labour. He said the introduction of machinery had always created a demand a thousand-fold larger than the most sanguine ever looked for. Then why did the working brickmaker shut his eyes to this fact ? Could he not see that when bricks are made by machinery his position would be raised from that of a drudge to that of a scientific *employe?*—that the demand which was now supplied by numbers of little masters who could barely earn a living would, with mechanical agency, become so thriving a business that the working man's practical abilities would become tenfold more valuable, and he would no longer need to bring his wife and children into the open brickyard and earn his living during a few months in the year, but would take his place among mechanics and other artisans who owed their existence to the mechanical resources and inventive genius of this great country? Surely the common sense of the working brickmaker could not long remain unimpressed by the false position in which he must put himself by taking such a stand ; and the force of circumstances, the inevitable current of advancement, would force upon him that which he vainly strove against.

A vote of thanks was given to Mr. Pollock for his paper, which he acknowledged, and afterwards explained the working of his machine to the members present by a reference to the model.

ROYAL ARCHÆOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND.

THE congress of this association was opened on Tuesday afternoon, at the Guildhall, Leicester. The Mayor, attended by the Town Clerk and Members of the Corporation, met the members of the Institute in the old Town Hall, where the inaugural proceedings took place. Among those present were Lord Talbot de Malahide (President of the Archæological Institute), the Venerable Archdeacon Fearon, Rev. R. Harley, F.R.S., Rev. E. Hill, Mr. J. H. Parker, F.S.A., Archdeacon Trollope, Archdeacon Stanton, Professor Lewis (Cork).

The first business was the presentation of an address of welcome from the Mayor and Corporation of Leicester. This briefly alluded to the objects of archæological interest in the town—the Norman remains, churches, &c. ; and also to the historical connection of the county. The Mayor regretted that necessities of commerce had caused the demolition of certain Roman remains ; but now they must reap consolation from the more Christian and more humane sentiments which replaced them.

Lord **TALBOT DE MALAHIDE**, in acknowledging the warm welcome of the people of Leicester and Leicestershire, referring to the Mayor's remarks, said he considered the two objects of the advance of civilisation and commerce, and the preservation of antiquities, might be perfectly reconciled. It was possible for a city to follow the line of progress, and, at the same time, not to disregard the memorials of the glories of our forefathers. He also made some remarks on the ancient character of municipal corporations. It was, he said, very difficult to trace their origin, but some people went so far as to say that the Romans left the traditions of corporate bodies, which afterwards were adopted and modified in subsequent ages. But antiquity was not their only honour ; they had played in nobler games than any of the continental cities. They had not lent themselves as submissive tools to despots, who wished to stifle the expression of public feeling. On the contrary, they had always banded themselves with those who were in favour of moderate reforms for the improvement of the country, and there was no nobler period in the annals of Corporations than when Simon de Montfort, with the aid of the barons and the burgesses of Leicester, began his career, and succeeded ultimately in laying the foundation of the British House of Commons.

Mr. **CLARKE** acknowledged the welcome offered by the landowners of Leicestershire, and pointed out that the county had given birth to or possessed descendants of Fielding, Beaumont, Herrick, and Haselrigg.

Archdeacon **FEARON**, in welcoming the Institute, on behalf the clergy, spoke of the humanising influence of the study of the past, and called to mind the fact that it was from Leicester that Richard III. set out for Bosworth Field, whence he was never to return.

Rev. C. J. **VAUGHAN** moved the welcome of the clergy ; and Archdeacon **TROLLOPE** acknowledged it.

Rev. R. Harley welcomed the Institute on behalf of the Local Literary and Philosophical Society.

Sir T. E. Winnington (Worcestershire) acknowledged the welcome, though confessing that in the West Midland counties their associations with Leicestershire were more of a sporting character.

This finished the formal business.

Mr. Parker, F.S.A., then gave a short description of the Guildhall, which, he said, was built in the time of Elizabeth, and was, in fact, opened on the day of the defeat of the Spanish Armada.

Some local objects of antiquity were then visited, Mr. Parker being *cicerone*.

On Wednesday evening the first neeeting for the reading of papers was held in the Freemasons' Hall. Some of these we hope to be able to notice next week.

Discovery of a Monumental Cross in Faversham Creek.—Mr. George Bedo furnishes some observations on a monumental cross which has been found in Faversham Creek, and now standing in the grounds of Davington Priory. The shaft supporting the cross is formed of various twisted columns, formerly brought from the ruins of Faversham Abbey. The transverse bar on the front of the cross has the following words incised upon it: "Marget Warmecoort." Apparently an inscription had once been on the back, but it is now obliterated. This is said to be the only existing monumental cross in the neighbourhood of an early date, and the place in which it was found affords tolerable evidence of the way of disposing of similar crosses at the time of the Reformation.

Suffolk Institute of Archæology.—This society proposes an excursion on Thursday the 11th of Augnst, starting from Halesworth, to visit Southwold and Blythburgh. Lord Arthur Hervey is the new president of the society, and the Committee, in a recent report, expresses its hope that under his lordship the members may be stimulated to fresh efforts to make the meetings and transactions of the Institute in some degree worthy of the earlier days of its existence.

British Archæological Society. — The annual congress of the British Archæological Society will commence on September 5 at Hereford, where the Black Friars, Coningsby Almshouses, and Hereford Cathedral are the leading antiquities. Excursions will be made to Kenchester (Magna) and Creden Hill, Kilpeck, Abbey Dore, Rowlestone, Grosmont Castle and Church, Leominster, Monkland and Stretford, Llanthony Abbey, Ledbury, Eastnor, Wall Hills, and the Herefordshire Beacon.

The Royal Historical and Archæological Association of Ireland is taking steps to preserve from fast-approaching destruction the famous remains of the church and round tower of Glendalough, County Wicklow.

S. SAVIOUR'S CHURCH (SOUTHWARK) STRUCK BY LIGHTNING.

During the violent thunderstorm that broke over the metropolis on Tuesday morning the lightning struck and carried away from its position nearly the whole of the south-east pinnacle of S. Saviour's Church, which fell across the choir and south transept, carrying with it in its descent the whole of the flying buttress of the choir, and finally sliding to the ground beneath—a distance of nearly 200ft. The tower of the church, which is 35ft. square and 150ft. high, is surmounted by four elegant pinnacles, each of which is 30ft. high and about 5ft. in circumference. These pinnacles are built, so to speak, round an iron pin or vane, 8in. thick, which is surmounted by a ball. The fluid first struck the ball and ran down the pin, driving the massive stonework asunder, particles of which were scattered for a distance of 160ft., severely damaging the roofs of the houses in the immediate neighbourhood. Escaping from this outlet it next seized the water-pipes running along the roofs of the eastern and western naves, and after traversing each till it reached 8ft. from the ground, it escaped, leaving the marks of its departure in the shape of two small holes. The stone finial immediately beneath the vane, of a globular shape, and weighing nearly a ton, fell into the churchyard, striking in its descent and almost destroying one the massive flying abutments over the roof of the lady chapel, and burying itself several inches in the stone pavement running through the churchyard. A large fragment broke through the roof of the transept, and came down with a tremendous crash at the foot of the famous monument to the poet Gower, founder of the Sutherland family.

A disaster not quite so serious in its character, but rendering complete restoration necessary, occurred to the south-west pinnacle of the same tower about twenty years since.

Mr. Jarvis, the parochial architect and surveyor, ascended to the summit of the tower on Tuesday, and has given the needful instructions for the removal of the wreck of the turret. Neither the admirable peal of bells nor the clock have suffered injury.

PARLIAMENTARY NOTES.

Water Supply in the East of London.—Mr. C. Reed, on the 21st inst., asked the Secretary of State for the Home Department whether his attention had been directed to the fact that great privation and suffering is caused at the present time by the diminution of the water supply in the east of London; and whether her Majesty's Government could give an assurance to the House that measures would be taken early next session to give effect to the recommendations of the Commissioners in reference to the supply of water in the metropolis.—Mr. Bruce said he had received no information of a deficient supply of water in the east end of London, and the only communication he had received on the subject was a letter from the secretary of the New River Company, stating that his attention having been drawn to a question of his hon. friend he had written to the East London Water Company offering assistance, and had received a reply that there had been no deficiency. With regard to the latter part of the question, the subject could be considered in connection with the larger question of the local government of London, when he hoped to give effect to the recommendations of the Commissioners.

The National Gallery.—Mr. Beresford Hope, on Monday, called the attention of the house to the present condition of matters relating to the plan for the enlargement of the National Gallery. The Government had provided him with papers which he did not ask for, and their production was calculated rather to embarrass and confuse an already complicated and entangled question. He complained that having asked for plans he had been hurried back to the competition between the designs of Mr. Barry and Mr. Murray. Neither of those designs was accepted, but one of those gentlemen was appointed, as a natural consequence of the report upon the competition, to prepare a design for the National Gallery—but not the one which had been said not to be fit for its object. An appointment having been made on certain conditions, the antecedent conditions had been produced in a mutilated form, which appeared to be depreciatory of the architect, and calculated to give the public an idea that the whole work was a sort of competition between Mr. Layard at Madrid, Mr. Barry, and Mr. Murray.—The Chancellor of the Exchequer announced that the Government had come to the conclusion that it would be possible to do something in the direction of the enlargement of the National Gallery during the present session, and a supplementary estimate would be laid before the house for that purpose in a few days.

Supply.—On the house going into committee of supply on the supplementary estimates, Mr. Ayrton moved that £10,170 be granted for alterations in rooms in the Houses of Parliament. The hon. gentleman explained in a detailed manner the alterations which were considered necessary, and said that a committee had recommended that the conference-room and some adjoining rooms should be converted into a principal refreshment-room, and that the present refreshment-room and its adjoining offices should be converted into tea and newspaper reading rooms. That adaptation of those rooms would, in his opinion, prove the best course that could be adopted. It had been suggested and recommended that part of the building should be pulled down, and a new refreshment-room be built; but he protested against the pulling down any portion of the building, his opinion being that it was better so to alter the internal accommodation to adapt the building to internal requirements without pulling down any portion of it and then building new rooms. By his plan the whole suite of rooms required would be under one roof, with most convenient communication between them for members. There was only one point more, and that was that he suggested that there should be a joint service for the refreshment-room, which the House of Lords declined, but they made certain suggestions which he thought unnecessary with respect to the refreshment-room of this house. He should have been glad if not a single stone of the outer walls was touched, but as the House of Lords had expressed a desire that there should be greater accommodation he thought the house would not object to the vote. He might mention also that the ladies' gallery was to be altered by giving them an additional room, and removing the grating which interrupted their view of the house. (Hear, hear.) An additional room was also to be provided for the reporters, who at present were subjected to great inconvenience and annoyance, being obliged to take their refreshments in a small and inconvenient room, in which they had to carry on their very useful duties. By the arrangement he proposed a convenient room would be allotted to them in which they might take their refreshments in comfort. There were minor improvements, among which was the cutting of the principal window in the smoking-room; so as to give members a view of the terrace, and if that was found to be a good arrangement, a further move in the same direction would be made. It was also proposed that there should be a better access to the strangers' refreshment-room, and a means by which the privacy of the members' lobby would be secured, while they would be enabled to communicate with gentlemen who wished to see them in another room. All these rooms would be *en suite*, so that there would be the greatest amount of accommodation given with the least trouble to members.—Mr. C. Bentinck criticised the plan of the right hon. gentleman, which he said was really based upon the acknowledged plans and suggestions of Mr. Barry, whose treatment by the right hon. gentleman had been so bad. The continuity of the corridor would be spoiled by a tavern bar, and the other peculiar features of the building would be destroyed, while the kitchen would be separated from the dining-room by a distance of 90ft. and dinner would be served without either light or air. In conclusion the hon. member moved to reduce the vote by £7160, the amount of the item for re-arranging the refreshment department.—Mr. B. Cochrane said he deprecated any arrangement which would look like ingratitude to the late Sir Charles Barry, and he saw no reason why the opinion pronounced on the question by his own son should be disregarded.—Mr. Cowper-Temple regretted that his right hon. friend had instituted a comparison between himself and Mr. Barry, with regard to matters of architecture. The scheme appeared to him very faulty, and especially as regarded the distance between the kitchen and the refreshment-room.—Lord J. Manners, while approving of the plan in some of its details, expressed his regret that the plan of Mr. Barry had been departed from.—Mr. W. H. Gregory protested against patchwork such as the proposed alterations indidated, and threw out a suggestion that the vote should be postponed until next session, when some general well-defined plan of alteration could be carefully considered and determined upon.—Colonel W. Patten thought postponement of the vote desirable.—Mr. Beresford Hope must distinctly state that Mr. Barry brought a scheme before them in relation to the refreshment-rooms, which was only postponed at the time by a position taken by the Lords. That plan would incur an outlay of £24,000, but the scheme if acted upon would have proved most satisfactory. With regard to the proposal of his right hon. friend, he must say that it would not hold water. As to the scheme before them now, it would, if agreed to, convert the portion of the house to which it referred into a most uncomfortable eating-house.—Mr. Ayrton, comparing the proposed plan with that of Mr. Barry, said the plan of that gentleman was that the refreshment-room would be 24ft. long, and that the service of refreshments would have to be carried the whole length of that room; while, by the present plan, the lift would be more convenient, and the service would be from the centre of the room.—Mr. Bentinck understood that Mr. Barry's plan would have furnished a room similar to that of the Reform Club, and hon. members who frequented that club could readily form an idea of what convenience the proposed room was likely to afford.—The amendment was negatived without a division, and the vote was agreed to.—A vote of £21,674 for the maintenance and repair of the Royal palaces was agreed to, as was also a vote of £80,437 for the maintenance of the Royal parks and pleasure grounds. The vote of £123,807 for the completion of public departments was next agreed to, as was also the vote of £11,700 for the supply of furniture for public departments.—On the vote of £22,387 for the completion of the buildings of the Houses of Parliament, Mr. Ayrton, in answer to several questions, said that a committee of artists had come to a unanimous conclusion that it was not desirable to continue the mosaic decorations of the central hall. The right hon. gentleman, in reply to Mr. Neville Grenville, said that it was intended to continue the plate-glass coverings over the frescoes in the central hall. The vote was then agreed to.—Votes of £12,500 for the purchase of land as sites for public offices near Downing-street, and £24,083 for the enlargement of public record depositories, were then proposed and agreed to.—On a vote of £6395 for the repairs and decorations of the Chapter-house at Westminster, Mr. Ayrton explained, in answer to Mr. Goldney, that that vote would complete the works up to a certain point, the roof and windows being finished, but without any attempt at decoration. The vote was agreed to.—£7067 was then voted for sheriffs' court-houses, Scotland ; £11,200 for the buildings connected with the University of London ; £13,250 for the new buildings connected with the University of Glasgow ; £6500 for the Industrial Museums, Edinburgh ; £5500 for the new works at Burlington House ; £101,245 for buildings connected with the Post Office and Inland Revenue ; £9344 for the maintenance and repair of the British Museum buildings ; and £40,752 for county-court buildings.—On the next vote, one of £80,170 for surveys in the United Kingdom, Mr. Stephenson said that it was desirable that there should be a larger sale of these maps, but they were little suited to the purposes for which they were most required.—Mr. Pell observed that in these surveys some districts appeared to be favoured. He thought some different principle might be adopted with a view to more uniform results.—Mr. Goldney, Mr. W. Hoskyns, and Mr. Miller also expressed themselves dissatisfied with the mode in which the survey was conducted.—Mr. Ayrton said there was no subject which gave so much trouble, on account of the different ideas that prevailed upon it at different times, as the survey. The expenditure upon it was at the rate of £140,000, and that continued during ten years would make an expenditure of about a million and a half of money. The vote, after some discussion, was agreed to.

PRACTICAL NOTES.

PROTECTING BRONZE FROM DISCOLOURATION.—The fact that in all large cities, especially where coal is burnt, bronze monuments quickly present a dirty, black appearance, has incited the Society for the Promotion of Mechanic Arts in Prussia to undertake some experiments looking towards a remedy. Analyses of ten bronzes, which were remarkable for their beautiful surface, showed that their constitutents varied too greatly to permit the composition of a bronze being taken as a cause of its retaining a proper surface or not. Attention having been drawn to the fact that those parts of public bronzes which were most handled retained a fine surface, it was surmised that the presence of fat might exert an influence. The surmise has been tested by exposing for some years a bronze which was daily rubbed with oil, the excess being removed by a rag, along with three others, one of which was daily cleansed with water, a second treated in the same way but twice during the year coated with oil, and a third was left untouched. The first was very beautiful, the third less so, the second had nothing of the beautiful surface, the last was dull and black. It is hoped that the discovery may enable us to preserve the statues in large cities bright.—*Journal of the Franklin Institute.*

GLYCERINE CEMENT.—Professor Hirzel, of Leipzig, has discovered an important use of glycerine that ought to be more generally known. He finds that when glycerine is mixed with fine and well-dried litharge it yields a cement that is capable of a large number of applications. All metals and nearly all solid bodies can be bound together by this cement; it is said to harden under water as readily as in the air, and to resist a temperature of 500°. It is especially recommended for such pieces of apparatus as are exposed to the action of chlorine ; hydrochloric acid, sulphuric acid, sulphurous acid, and nitric acid ; also the vapour of alcohol, ether, and bisulphide of carbon, as none of these agents act upon it. The cement can be used in steam engines, pumps, foundations for machinery, and, finally, as a substitute for plaster in galvano-plastic and electro-plating. The preparation of glycerine and litharge to be taken must depend somewhat upon the consistency of the cement, and its proposed uses. An excess of glycerine would retard the setting, as it does not readily evaporate. This new use of glycerine adds another application to a substance that only a few years ago was thrown away.

CHINESE GOLD LACQUER.—The gold lacquer lining of a Chinese cabinet, in the museum at Cassel, pealed off, and thus gave Dr. Wiederhold the opportunity of studying the composition of this substance. On examining it, he found particles of tin foil attached to the lacquer, so he comes to the conclusion that this material formed the ground upon which the laequer varnish was laid. His attempts to imitate the varnish were perfectly successful, and he gives the following directions for the preparation of a composition which closely resembles the true Chinese article. First of all, two parts of copal and one of shellac are to be melted together to form a perfectly fluid mixture, then two parts of good boiled oil, made hot, are to be added ; the vessel is then to be removed from the fire, and ten parts of oil of turpentine are to be gradually added. To give colour the addition is made of solution in turpentine of gum gutta for yellow, and dragon's blood for red. These are to be mixed in sufficient quantity to give the shade desired.

Building Intelligence.

CHURCHES AND CHAPELS.

BARTON PARVA, SUFFOLK.—A new organ chamber has been added to this church, from the designs, and under the superintendence of Mr. E. Swinfen Harris, architect, of London. Mr. William Edwards, of Mildenhall was the contractor.

BASINGSTOKE.—On the 10th inst., the little parish church at Church Oakley was reconsecrated by the Bishop of Winchester, after having been reconstructed, at a cost of £5000, from plans by Mr. T. H. Wyatt, architect.

BERMONDSEY.—The new church of S. Anne, Bermondsey, was consecrated on Thursday week by the Bishop of Winchester. The style of the building is that of about the end of the twelfth century. The interior is of plain brickwork, unplastered, with little decoration except bands and arches of red brick, and carved cap-heads. Externally the ends of the building are relieved by red brick arches and string-courses, with Bath stone dressings to angles and openings. There is a stone spire at the south west angle 60ft. high. The roof is open-timbered and stained, the height to the ridge being 42ft. The length of the building is 101ft., and the width 49ft., and it is capable of seating 700 persons. Mr. J. Porter, of Grange-road, Bermondsey, is the architect, Messrs. Browne and Robinson being the contractors. The cost has been £3000.

BRAEMAR.—The new church at Braemar, which was commenced about a year ago, was opened on Sunday last. The cost of the church and spire is about £2212. The building is in the Early English Gothic, cruciform in plan, with semi-circular apse, north and south transepts, north and west porches, and tower and spire. The tower and spire, which together rise to the height of 112ft., contain vestry and belfrey. The architect is Mr. Robert Lamb, of Darlington.

GOOLE.—The (Roman) Catholic chapel and schools of S. Thomas of Canterbury, Goole, Yorks, have been opened. The buildings are of a simple and unpretending design of Gothic character, and are built of grey stock bricks, with stone dressings and bands of black and red bricks sparingly introduced. A commodious house, adjacent to the schools, for the residence of the incumbent, is rapidly approaching completion. The works are being carried out by Mr. Elliott, of Goole, under the superintendence, and from the plans of Messrs. Hadfield and Son, the architects, of Sheffield. Mr. Cairns, of Leeds, is the clerk of works.

HORNSEA, NEAR HULL.—A new Wesleyan chapel has just been erected here. The building is Gothic, of red brick, with stone and moulded red brick dressings. The internal dimensions are 57ft. by 40ft., and accommodation is provided for 360 persons on the ground floor, provision being made for inserting a gallery at a future period. The pews are of varnished deal, without staining; the pulpit and communion are of pitch pine. The roof is open to one-half its height, showing the curved principals and the rafters. The acoustic properties of the building are perfect. The main entrance is by means of a porch, having three richly-moulded brick arches, carried by isolated circular columns having boldly-carved capitals. The total cost of the building, including a schoolroom 25ft. by 16ft., minister's vestry, two class-rooms, warming and lighting, &c., is about £1200. Mr. J. K. James, of Hull, is the architect, and Messrs. Barr, of Hornsea, are the contractors.

NORTHAM, SOUTHAMPTON.—The rebuilding of this church is contemplated. Plans have been prepared by the architects, Messrs. Guillaume and Parmenter of Southampton. The new structure will be in the Early Pointed style, of foreign treatment, and will comprise a nave, side aisles, chancel, organ chamber, vestry, and tower and spire. The church will accomodate about 800 people, and will cost about £5000. The site has been presented by T. Chamberlayne, Esq., of Cranbury Park, who has also subscribed £500 towards the building fund.

PECKHAM.—On Tuesday week the foundation stone of a new Baptist chapel was laid in James's-grove, Commercial-road, Peckham. The chapel will be a plain brick structure, without galleries, and capable of seating 400 persons. Beneath the chapel is a school. The only ornamental feature will be the entrance, which will be approached by a noble flight of steps, and is formed of two arches supported by pillars of Aberdeen granite, with ornamental caps. The pilasters will be of plain stone, and the roof of slate. Mr. Joseph Thompson, of Bedford-row, W.C., is the architect, and Mr. Joseph Mitchell, of Camberwell, the builder. The cost will be £1400.

BUILDINGS.

EAST GRINSTEAD.—A large portion of the Convent of S. Margaret, East Grinstead (illustrated in THE BUILDING NEWS for Dec. 18, 1868) was opened on Wednesday week. The building, so far as it has gone at present, forms three sides of a square, the middle portion of which, containing the chief entrance, only is completed. According to the designs, it appears that, at a cost of about £15,000, about one-half of the chief quadrangle is finished. Over the entrance in the centre of the western front is a life-sized stone crucifix, with S. Mary and S. John carved in high relief, by Mr. Earp, who also filled a niche below (at his own expense) with a figure of the patron saint. The south wing is formed, so far as it has reached already, by the refectory (now fitted up as a temporary chapel). Behind this are the domestic offices, comprising a very large kitchen, scullery, pantries, laundry, &c. The north wing has a number of sitting rooms on the ground floor, opening into a covered passage on the inside of the building, and above these are the sisters' cubicles. At the north-west corner are the school-rooms, class-rooms, oratory, &c. ; and in the west, or centre portion, the waiting-rooms, visitors' apartments, &c. The style of architecture is Early Second Pointed for the refectory, the remaining portion being Plain First Pointed. Mr. G. E. Street, A.R.A., is the architect, his services being given gratuitously.

LAISTER-DYKE.—On Saturday afternoon the foundation-stone of a new Sabbath school was laid at Laister-Dyke, Yorks. The building has been designed by Mr. G. S. Pickard, architect, will measure nineteen yards by twelve yards, and will accommodate 320 scholars. The total cost will be under £900.

NEWINGTON.—The question of enlarging Newington Workhouse is under consideration b the Guardians. Under an order from the Poor Law Board, an estimate has been obtained from Mr. Jarvis, architect, for the building of a new wing and other additions, to give accommodation to about 400 more inmates ; the cost of which would be about £18,000. A proposal has been made (but has not met with much favour), to erect an entirely new workhouse on land situate beyond Peckham Rye, at a cost of about £60,000.

SAVERNAKE.—We learn that the Marquis of Ailesbury is about to re-model a large number of dwellings on his lordship's estate at Savernake, in Wiltshire. Each cottage will contain a living room, scullery, and three bedrooms, with entrance porch pantry, woodhouse, piggery, privy, cesspit, and ashpit. Each dwelling will have a hard and soft water supply, with washing copper, pumps, sink, and a fire clay baking oven of an improved description. The living rooms will be fitted with ranges having ovens, and the bedrooms will have small cottage grates. Some of the dwellings will have all their bebrooms on the chamber floor, while in others one of the bedrooms will be arranged on the ground floor. The cottages will be built of a local red brick, made on his lordship's estates, relieved with dark grey bricks. The roofs will be covered with Staffordshire or Bridgwater tiles in bands and courses, finished with an ornamental crested ridge. The porches will have projecting roofs, supported on corbels and brackets, and the dormer windows will also have bold projecting roofs. The cottages will be erected in pairs and groups, affording altogether a pleasing and rustic appearance. The works will be carried out from the designs, and under the superintendence of Mr. John Birch, of Beaufort-buildings, London, whose designs it will be remembered, gained the Society of Arts' Prize Medal and Premium, and have been successfully carried out in many parts of the country.

Weymouth.—The foundations of new infant schools for the parish of Holy Trinity are being put in, and the foundation stone will soon be laid. The main part of the new building will contain about 1600 superficial feet, and to this is added at the north-west corner a wing enclosing about 400 square feet., thus providing accommodation for about 200 children. The style of architecture will be Gothic, Mr. G. R. Crickmay, of Weymouth, being the architect, and Messrs. Norman and Co. the contractors.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

PLAN-DRAWING BUILDERS.

(To the Editor of The Building News.)

Sir,—To those happy architects whose clients know good work from bad it matters nothing how many builders may set up as draughtsmen of plans. To some others, however, the subject is at times of consequence. There is always a section of the public ready to jump at whatever looks like a bargain, and so eager to save 5 per cent. in one quarter as to overlook the chance of losing 10 or 20 per cent. in another. To offer such people drawings gratis is to catch them at once; and when caught, it is difficult to pity them. A very little common sense would tell them what to expect when a builder offers to find them plans for nothing if they will only let him do his work without inspection. The proposal speaks for itself; and in many cases I believe these complaints about architects' conduct are a mere pretext for putting it forward with a better grace. To the scamping builder the architect is a natural enemy, and *his* abuse is the highest praise. Some dishonest men there doubtless are in the architectural profession, and considering that it is a perfectly open one, it would be something more than a miracle if there were not. The question is, why do not builders expose them? It is they who have the proofs of their misconduct, and it is they as well as the public who suffer by it. To get rid of such men would be doing the best service to honest people in both classes. One has heard of architects who gain a high reputation for liberality by preparing plans gratis for public buildings of a certain sort. They charge their clients ostensibly nothing; their bills of quantities, however, cost from 3½ up even to 7 per cent; they have a commission on goods supplied, and perhaps another commission from the builder. But one has also heard of contractors, equally acute and devout, grasping all the work connected with some large religious body, intriguing for the architect's removal, executing the work (out of pure love of the truth) some hundreds of pounds dearer than respectable firms would have done it for in similar fashion,—and at last being thanked for it all in print, in terms that might make Mephistopheles blush. Is it not possible for upright men, whether architects or builders, to join in clearing away some of this cant and jobbery which disgrace a certain stratum of both professions?—I am Sir, &c.,

Candide.

GUGLIELMO DA CASTELBARCO.

Sir,—The circumstance that Mr. Redford's drawing of the tomb of Guglielmo da Castelbarco should appear in The Building News on the same day that my notice of it was published in the *Athenæum* is remarkable. It would almost seem to have been designedly intended, and induces me to send you some further particulars of that eminent individual whom the monument commemorates.

Guglielmo da Castelbarco, the Lord of Lizzana, combined in his character many qualities which are rarely found united; he was an able ruler, a wise governor, a clever politician guided by principles of justice and the consideration which is due to everyone; in his manner he was extremely courteous and polished, and by these means often succeeded in difficult and delicate negotiations, which, in the hands of one less solicitious not to wound the personal feelings of the parties concerned, would have collapsed to his own confusion. He was also a very benevolent and charitable man; his munificence was princely, his piety exemplary. Verona had every reason to be proud of him, and to place his monument where it might be conspicuously seen by all her citizens.

It was in 1307 that Guglielmo da Castelbarco began to build, on the ruins of the palace of the Count di S. Bonifazio, the splendid church of S. Anastasia, and the convent at the side. In 1313 he commenced rebuilding the church dedicated to the Saints Fermo and Rustico, along with the monastery adjoining. In 1317 the works at S. Anastasia, which had been for a short time suspended for want of funds, were again proceeded with, the completion of this church being one of the three things, which, according to the Veronese historian Girolamo dalla Conte, who flourished in the sixteenth century, Guglielmo da Castelbarco had most at heart. The two others were, the completion of the new church of the Saints Fermo and Rustico, and his own repentance before God for his sins. Castelbarco resided alternately at Verona, to which he was attached by many friendships, and his castle of Lizzana in the Val Lagarina, where, in his own right, he ruled the territory around. It was here, in 1319, that he dictated his last will and testament, in which, among the many legacies to the poor and the churches, Verona came in for a considerable share. In the following year, on the 6th of January, he died, and his body, as he had directed, was transported from Lizzana to Verona for interment in S. Anastasia. Can Grande, who then swayed the destinies of fair Verona, followed the remains of his friend to the grave, accompanied by the Podesta, and all the cavaliers and persons of distinction in the city and neighbourhood, and there was a general mourning for him among all the people, for Guglielmo da Castelbarco had been universally beloved. The intimate friendship of such a man speaks well for the rulers of Verona, and his sympathy for Dante Allighieri sheds an additional lustre on his name. I am, &c. H. C. Barlow.

Newington Butts, Surrey,
July 25th, 1870.

SHARP PRACTICE.

Sir,—A gentleman sent for me about some work he wanted doing. He told me the way he thought of having it done; I told him it would not be right to do it so. He then said "Which way would you do it? I told him, and he said "You are right; make out a specification and tell me what you will do it for." I did so. He then got other tenders, which, I suppose, were less than mine, and he had the work done just as I had written it down in my specification, I want to know if any of your numerous readers can tell me if I can get any recompense for my trouble?—Yours, &c.,

Manchester. J. B.

"BUILDERS' DRAWING PLANS."

Sir,—I was much pleased at seeing in your paper a letter signed "An Old Subscriber," and think that your correspondent "Builder" does not understand the meaning of the letter. We do not for one moment wish builders to tender low for work; on the contrary, "honest architects" will do all they can to advise their clients not to accept the lowest tender. But we do certainly require some kind of protection against joiners and stonemasons being architects. What is the use of parents paying for their sons to learn a profession that is cut up by builders pretending to be their own architects? I would suggest that all "honest archicects, I trust there are many in this town—should agree that on no account shall "builders" be allowed to tender for their work when it is known that they draw plans. I am sure that builders would find it better for themselves, as also would the proprietor. I never heard of builders buying their own certificates before. Surely "Builder" means the "joiners and stonemasons," who do a lot of business in a very careless way?—Yours, &c.,

One who Can Produce His Indentures.

Hull, July 26, 1870.

Intercommunication.

QUESTIONS.

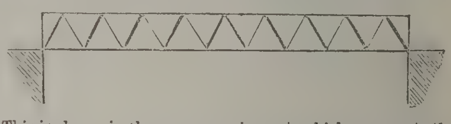
[1902]—SURVEYOR OF TAXES—Can any reader of The Building News inform me what are the qualifications necessary to secure the post of surveyor of taxes? Also, are the Civil Service Commissioners the examining body?—Assistant.

[1903.]—HOT OR COLD BATH.—Can any reader give me information on the following points? 1st. What means could I adopt in order to get hot water from a wash-house copper (on the ground floor) to a bath (on the first floor), without carrying it? Will a pump answer the purpose? If so, what sort, size, and price? I have an idea that hot liquids cannot be pumped, as they would injure the pumps; is this idea correct, and if so, what other expedient can I adopt? If, however, hot water can be pumped, I presume that the same pump will also serve to pump up cold water from the butt? 2nd. Would india-rubber or gutta-percha tubing answer? Any information on these points would oblige.—A Handy Man.

[1904.]—TESTING PORTLAND CEMENT.—Will any one inform me what simple apparatus can be had for testing the quality of Portland cement; whether the instrument used by the engineer to the Main Drainage works is the best, and if so, where can such a one be purchased?—Wiltshire.

REPLIES.

[1897.]—GIRDERS.—A "Warren" girder is so called from its inventor and patentee, Captain Warren. As it has undergone many changes since its first introduction, a brief notice of its distinguishing characteristics will be of service to your correspondent. It is distinguished from the lattice type by having only one series of triangles in the web or side.



This is shown in the accompanying cut, which represents the elevation of a Warren girder. The first Warren girders had the compressive bars, which are shown in the cut by thick lines, made of cast iron, but the failure of one or two examples induced engineers to abolish the use of cast iron in these bars, and make them of wrought iron. There are two other points in which these girders differ from lattice ones; one is, that the angle of the sloping bars with the horizon is sixty degrees, and the other, that the bars are united to the flanges by pins instead of rivets. The Warren girder is always taken as the primitive type in calculating the strains upon either a lattice or braced girder of any description.—Design.

[1898.]—RECLAMATION BANKS.—"Contractor" may be assured that there is no "fancy" in the matter at all. The sea slope of every reclamation bank is always made flatter than that upon the land side; the reason is quite clear. It is upon the outer or sea slope that the water exerts its destructive force, and it is there that the flatter inclination is required. "Contractor" need not think 3 to 1 very flat for the outside slopes, for they are frequently made 6 to 1, and sometimes 12 to 1. It all depends upon the force of the sea and the nature of the material of which the bank is composed.—L. M. P.

[1899.]—BOOKS ON HARBOURS.—The only really good work on harbours is a book by Sir John Rennie, but the price is very high. The plates are exceedingly well executed. Try at Spon's.—V. S.

[1900.]—STONE DUST IN MORTAR.—If "G. J. C. C." is carrying out any extensive works, or even any works that he is desirous of having built in the best possible manner, and with the best materials, he should engage a strict and honest clerk of works; it would be his duty to see that the work was properly done, and that no inferior or defective materials of any kind were used. By this means "G. J. C. C." ought to get rid of the anxiety caused by suspicion of his builder's honesty in trade.—J. W. R.

[1901.]—ARCHITECTURAL PERSPECTIVE.—The most thorough work on perspective, is Malton's, and one of the worst is Mr. Ruskin's. Probably the "Rudimentary Perspective," published by Weale, will give Mr. Moore all that he may require. Remembering the difficulty I met with in my younger days, in mastering perspective from books, I shall be happy to give Mr. Moore an oral explanation (*con amore*) of the mysteries of perspective practice, if he will give me a call. My address can be obtained of the Editor of The Building News.—P. E. M.

STAINED GLASS.

BLOXWORTH.—The east window of Bloxworth Church, Dorsetshire, has just been filled with stained glass by Messrs. Heaton, Butler, and Bayne, of London, the subject being the Resurrection. The window is divided into three compartments, the central one, containing a nearly life-sized figure of our Saviour, with the Roman guards lying beneath, and on either side the Virgin Mary and the women who first came to the sepulchre. Some stained glass bordering has also been introduced into the side windows.

THE FAIRFORD WINDOWS.—A series of tracings, carefully coloured, from the stained glass windows of Fairford Church, are in course of being placed in the South Kensington Museum.

S. MARY THE VIRGIN, WOLVERTON, BUCKS.—A new two-light stained glass window has just been inserted in this Church. The subject is "The Anunciation," and it has been very ably treated by the artists, Messrs. Bell and Almond, of London.

◆

WATER SUPPLY AND SANITARY MATTERS.

THE DISINFECTION OF SEWERS.—Dr. Stevenson, the St. Pancras Medical Officer of Health, reports to his Vestry that several cases of enteric fever have occurred in the neighbourhood of the old Fleet sewer, Gray's-inn-road. He has urged, he says, upon the Metropolitan Board of Works the proper disinfection of the main line of sewers from which offensive effluvia have of late been sent forth. Dr. Stevenson's representation touches us very closely, for beneath the windows of the office of this journal are sewer openings which all through the hot weather have been emitting the most nauseating and dangerous effluvia. We (*Lancet*) have brought the matter under the notice of the district health officer, but without the slightest appreciable effect, and we have nothing left us therefore but to echo Dr. Stevenson's call for such measures of disinfection as shall prevent our sewers from poisoning us outright. We do not hesitate to say that a very heavy responsibility will rest on the Metropolitan Board of Works in respect of those great works of theirs beneath our feet should any epidemic disease break out in London that may either originate with, or be aggravated by, the unwholesome condition of the sewers.

DONCASTER.—The corporation of Doncaster are threatened with an injunction by the River Don Navigation Company, if they continue to cast the town's sewage into the river Don; and last week a conference was held at the Mansion House, between certain of the directors and a committee of the Council, as to the best method of carrying the sewage forward to the Corporation estate at Sandall, and there applying it to the irrigation of the land.

◆

Our Office Table.

BUILDING UNDER DIFFICULTIES.—A writer in the *South London Press* vouches for the truth of the following story, which is certainly one of unswerving perseverance. About four years ago an eccentric personage, who follows the pursuit of bird-catching, purchased a small plot of land on the eastern side of Nunhead Cemetery. Here he resolved to build a good-sized six-roomed brick house with his own hands. He at once set to work, and has now nearly finished his task. He has been his own architect, bricklayer, labourer, joiner, plumber, and glazier, and, what is still more strange, built the house without a particle of scaffolding, and even carried his own bricks from the maker's by the armful, as he was able to afford them. The work appears to be very substantial, and does him great credit. During the operations he has been living in a small brick hut built by himself on the plot at the onset.

A DAY IN THE COUNTRY.—The workmen employed upon the extensive alterations and additions at S. Audries, the seat of Sir A. A. Hood, Bart., were invited by their employer, Mr. H. Davis, of Taunton, to a day's excursion to Minehead on Tuesday, the 19th inst., to which pleasant watering-place they were conveyed in breaks, omnibuses, &c. After strolling along the beach for some time, the men, together with some friends connected with the works and estate, sat down to a good and substantial dinner, provided by Messrs. Fry and Langdon, of Williton. At the request of the company, Mr. Griffiths, the clerk of the works, occupied the chair. The toasts of the Queen and Royal Family, Sir A. A. Hood, Sir Peregrine Acland, Mr. Norton, the architect, Mr. Davis, the contractor, Mr. Griffiths, the clerk of the works, Mr. Marrs, the general foreman, &c., were succesively proposed and very heartily responded to. After enjoying themselves thoroughly, they returned at a reasonable hour safely to Williton, wishing each other many happy returns of the day, and success to their next merry meeting.

FIRE ESCAPES.—As we have frequently predicted would be the case, another terrible tragedy has occurred, owing to the utter inefficiency of our arrangements for saving the lives of persons who find themselves suddenly in a burning house. Six little children were burnt to death on Saturday morning in Waterloo-road, within a few yards of the fire-brigade station. This circumstance alone (says the *Pall Mall Gazette*) shows the necessity of attempts being made to devise and enforce the adoption of some more efficacious means for the preservation of life than those at present organised. If the fire brigade are unable to save the lives of their next-door neighbours on the occasion of a fire, our present system must be akin to a mockery and a sham. It would be far better to have balconies in front of every window in every house in London than that scenes should be enacted such as that which horrified the spectators on Saturday last.

A STINKING TOWN.—During the hearing of a case at the present Stafford assizes, in which one of the items in dispute was a claim for sewering several houses erected by the plaintiff in the town of Hanley, it was remarked that there was no public sewerage in that town.—Mr. Justice Mellor (to the plaintiff): If you had meant this town I could have understood, for it is the most stinking town I was ever in in my life. The sewage is allowed to flow down the streets, and one cannot walk out a dozen yards without meeting with smells of the most virulent kind.—Mr. Huddlestone: And yet strange to say it is the only town which was not visited with cholera, and it is the healthiest town on circuit.—Mr. Justice Mellor: Then I suppose what offends our noses does not affect our health. If the town was sewered the inhabitants would probably miss some favourite smell. (Laughter.)—Mr. Huddleston: That throws discredit on all sanitary movements.

INDUSTRIAL ART IN WOLVERHAMPTON.—Whilst Birmingham is exerting itself, with proverbial energy, to improve the technical education of the artisans and of the general public by establishing an Art Museum, Wolverhampton has just had the cultivation of art in the town and district retarded by the action of its Town Council. A collection of the productions of a country in which art has been fostered for thousands of years would be of much use to those staple trades of the locality in which artistic ornamentation is an important matter. The Government thought so, and asked Wolverhampton if it would take one of the fifty more of the valuable collections of the textile manufactures of India which are now being sent out. The collection consists of 1000 specimens of fine art work, and photographic and chromo-lithographic plates of the patterns of four hundred of the specimens. A committee of the Town Council recommended that a part of the above collection should be purchased by the Corporotion and placed in the Free Library, where they considered that it would meet with more observation than if it was bought and kept by the School of Art. The proposal was rejected, on the ground that only one portion of the artisans of the town—the japanners—would be benefited by it, and that, therefore, it was not for the Corporation to take the matter up. But it has been justly inquired (says a correspondent) "Is there no room for art decoration in the manufacture of locks and keys"; and "Have chandeliers attained the *ultima thule* of decorative excellence?" Further, the opponents of the proposition seem to have pretty much ignored the fact that it is as important to cultivate a taste for art work in the minds of the general public, who are the purchasers, as in those of the artisans, who are the producers.

PAYMENT FOR EXTRAS.—At the last meeting of the Poplar Board of Guardians, a letter was read from Messrs. Baker, Nairne, and Oxley, solicitors, in reply to one from the clerk to the Guardians, with reference to the payment by the Board for the extra charges by the contractors for the erection of the new workhouse buildings. The questions submitted by the Board were whether, under the specification, they were compelled to pay 75 per cent. upon the "extras" before the completion of the work; and secondly, whether, if they did so, it would prejudice such matters as might be brought under arbitration? The reply of the solicitors was to the effect that under clause 9 of the agreement the Guardians were bound to pay 75 per cent. of the cost of such work only as was mentioned in the contract, and they could not be called upon to pay for extra work until the building was fully and satisfactorily completed. The Guardians, therefore, were not bound to pay £2000, notwithstanding a certificate for that amount had been given by Mr. Morris, their surveyor. If, however, the Guardians determined to pay, the letter recommended that a receipt should be required in such a form as would reserve to each party the same rights with regard to arbitration upon the matter of any particmlar extra as existed before payment.

Chips.

The corner stone of new Wesleyan schools for Bolton, to cost £5000, will shortly be laid.

A new (Roman) Catholic schoolhouse is being erected at Cowgate, Edinburgh, from the designs of Mr. R. Anderson, at a cost of £1600.

A new infirmary is about to be erected in connection with the Freemen's Orphan School, at Brixton, at an estimated cost of £833.

S. Luke's Church, Lower Norwood, is about to be repaired and re-modelled, at a cost of upwards of £3000.

Messrs. Hopkins, Gilkes and Co., have accepted a tender for building a large viaduct for a branch of the North Eastern Railway system.

The last girder of the Sutlej bridge was hoisted on the 13th inst., completing the communication between Lahore and Calcutta.

Now that the high level bridge scheme is abandoned, it is expected that a strong effort will be made in the next session of Parliament to obtain the necessary powers for constructing a tunnel under the Severn at New Passage.

The Antwerp Exhibition will open on the 14th of next month, and close on October 2.

A house that has just been built in New York, with all the modern improvements, has a billiard table in the basement, a bowling alley in the cellar, and a croquet-ground beautifully fitted up in the attic!

The clock in the new Meat Market, Smithfield (central roadway) being completed, and several makers names mentioned in connection therewith, we beg to say the makers were Thwaites and Reed.

The opening of the new Dorset County School Buildings at Burton, will take place on August 8.

The foundation stone of a new Wesleyan chapel, at Shepherdswell, Kent, was laid on Wednesday week, by the Rev. Dr. Knowles, F.S.A.

The committee of judges for selecting pictures and decorative pictorial art at the International Exhibition next year is now completely named. It consists of Messrs. Elmore, R.A., Marks, A. Hunt, H. Warren, and Dillon, oil and water-colour painting; with Messrs. Redgrave, R.A. and Morris for decorative painting in general. With them are associated Lord Bury, Lord Elcho, and Sir Coutts Lindsay.

◆

Timber Trade Review.

Messrs Churchill and Sim's sale on the 27th was a very important one, as there was a great variety of wood offered, and builders will be anxious to learn the state of the market so soon after the declaration of war.

The following were the principal parcels on sale:—

15,800	Spruce deals, &c.
48,800	Quebec pine deals, &c.
9600	S. Petersburg deals and battens.
56,000	Swedish deals and battens.
6000	Finland deals and battens.
400	Pitch pine planks.
180,000	Prepared flooring and match boards.
2600	Fresh Norway spars and poles.
110	Fathoms lathwood.
320	Loads Quebec yellow pine timber.
200	Loads Quebec red pine timber.
2500	Loads Dantzic fir timber.
	&c., &c.

Prices ruled as follows:—

		£	s		£	s
Abo 1st yellow	per Petg. std.	7	5	to	8	5
		s	d		s	d
Bengo handspikes	per dozen	2	6	to	2	9

Messrs. Churchill and Sim's next public sale will take place on the 10th August, with the usual assortment of deals, battens, timber, &c. Much of the Dantzig timber was withdrawn, as no doubt better prices can be obtained for the full-sized descriptions. Altogether, there was a marked advance in the prices of Baltic goods, and a crowded room gave evidence of the anxiety to know the result of the sale. The price of Petersburg goods has advanced considerably, and the brokers did not seem at all anxious to force the sale. On the other hand, consumers did not seem more than usually anxious to bid, and probably until prices are more settled, will buy just for immediate consumption, until events on the Continent are more advanced. Whether such a course is judicious is a question upon which hardly any two consumers of wood agree.

USEFUL NOTES.

CALCIUM LIGHTS ON CAISSONS.—Mr. W. Milner Roberts, who is in charge of the work at the S. Louis bridge, says:—"We have used calcium lights only for our open-air work in laying masonry on the top of our caissons, one light on one side, and one on the other, on diagonal corners; we found that they distributed the best light when thus placed. We had the oxygen gas forced into copper gas-holders, with a pressure of about 200lb. to the square inch. These were carried over from the city to the piers on a little steamer, and the gas was conveyed to the burner through a small lead pipe. At first our reflectors were of glass, but so many were broken that they were replaced by metal. A man remained with the two burners through the night to regulate them occasionally, and to mend the pipes when a burst occurred. They usually burn from eleven to twelve hours; and, with the aid of some movable large reflector lamps, the masons worked as well at night as in the day. The cost of the calcium lights to our company was 3dol. 75c. per hour each."

CONTRACTS OPEN FOR BUILDING ESTIMATES.

DENTON (Staffordshire), Aug. 4.—1st. For the erection of a new south wing, for S. Chad's College. 2nd. For the erection and completion of kitchen, laundry, gas house, and offices. Architects, Mr. W. Slater and Mr. R, H. Carpenter, 4, Carlton Chambers, 4, Regent-street, London, S.W.

COASTGUARD CONTRACT, Aug. 9.—For the erection of a coastguard station, at Johnshaven, in the county of Kincardine, Scotland. Director of Works Department, Admiralty, Spring Garden-terrace, London, S.W.

ROYAL SOUTH LINCOLN MILITIA, Aug. 4.—For the erection at Harrowby, near Grantham, in the county of Lincoln, of twenty sergeants' quarters, an adjutant's house, and other buildings, for the use of the Royal South Lincoln Militia. Fred Burton, Clerk of Gaol Sessions, Lincoln.

LANCASHIRE AND YORKSHIRE RAILWAY, Aug. 16.—For the construction of a branch railway, from North Dean to Stainland, length about 1¾ miles. Wm. S. Lawn, Secretary, Hunt's Bank, Manchester.

ROTHERHAM AND KIMBERWORTH LOCAL BOARD WATERWORKS, Aug. 16.—For the construction of a storage reservoir on the Ulley and Morthern Brooks, near Packman's Bridge. W. Whitfield, Clerk to the Board, Board of Health Offices, Howard-street, Rotheram.

UXBRIDGE UNION, Aug. 5.—For the erection of additional buildings at the Union House. Charles Woodbridge, Clerk, Uxbridge.

THE GREAT INDIAN PENINSULA RAILWAY COMPANY, Aug. 5,—For crossings, as per specification and drawing. Thos. R. Watt, Managing Director. Company's Offices, 3, New Broad-street, London.

SOUTHAMPTON, Aug. 2.—For 600 tons of the best broken granite, and 200 tons of granite siftings. R. S. Pearce, Clerk to the Local Board of Health, Public Health Office, Audit House, Southampton.

STANNINGLEY, Aug. 11.—For the erection of two dwelling houses. Joseph Roberts, Architect, 18, East Parade, Leeds.

STOCKPORT, Aug. 3.—For wrought-iron girders, with purifier covers, wrought-iron bearers, and cast-iron plates, &c. James Jacques Engineer, Gas-works, Stockport.

ST. MARY ABBOTT'S, KENSINGTON, Sept. 7.—For the erection of a new infirmary and other buildings adjoining their workhouse. Reuben Green, Clerk to the Guardians, No. 1, Devonshire-terrace, Wright's-lane, Kensington.

FAILSWORTH LOCAL BOARD, Aug. 3.—For the construction of a main sewer. John Taylor, Clerk to the Board.

HENLEY LOCAL BOARD, Aug. 3.—For taking up the existing pitching in Bell-street, and providing and laying on concrete new worked stone gutters, &c. Frederick Haslam, Surveyor to the Board. Surveyor's Office, Henley-on-Thames.

HORSHAM, SUSSEX, Aug. 9.—For the erection of a villa residence, with conservatory and stabling, to be built at North Parade.

BOOTLE, Aug. 2.—For widening the Canal Bridge at Irlam-lane, by the addition of five cast-iron spandril girders on each side of the existing building. Thomas D. Pierce, Deputy Town Clerk, Municipal Offices, Merton-road, Bootle.

BROMLEY LOCAL BOARD, Aug. 1.—For the construction of about 11,000 feet of earthenware pipe sewers. Arthur Jacob, Bromley, Kent.

BRUTON CHURCH (Somerset), Aug. 12.—For the restoration of the nave of the above church. Messrs. Slater and Carpenter, 4, Regent-street, S.W.

LEEDS, Aug. 2.—For taking down and reconstructing fence walls, and altering buildings for widening Hunslet-road. C. A. Curwood, Town Clerk.

LEEDS, Aug. 6.—For the various works in fifteen houses and three shops in Hunslet-carr. Richard Towse, Architect, Dewsbury-road, Leeds.

LEEDS, Aug. 12.—For the erection of a new Wesleyan chapel, proposed to be built at Garforth, near Leeds. Geo. Smith, Architect, Popplewell's Chambers, Bradford.

LINCOLN, Aug. 15.—Parish church, St. Martin's.—For the building of a new church. William Stork Beckit, Architect, Bridlesmith Gate, Nottingham.

LEEDS, Aug. 9.—For the whole or any portion of the works required in the erection of a chapel, with schools and class-rooms, in Belle Vue-road. G. Gardiner, 9, East Parade, London.

LEEDS, Aug. 12.—For the various works required in the erection and completion of a villa residence at Woodland Grove, Chapel Town-road. Alfred H. Thompson, Architect, 14, Park-square, Leeds.

PARTNERSHIPS DISSOLVED.

John Kenworthy and Joseph Kenworthy, Lower Openshaw, near Manchester, plasterers—R. Hughes, D. Henderson, and D. Crawford, Liverpool, brass-founders.

THE BUILDING NEWS.

LONDON, FRIDAY, AUGUST 5, 1870.

WATER—GOOD, BAD, AND GOOD ENOUGH.

THE Royal Commission, of whom Sir W. Denison is chairman, and Dr. Frankland and Mr. John Chalmers Morton his colleagues, say that absolutely pure water is not to be found in nature. Even at the moment of its condensation in the atmosphere from invisible vapour to visible cloud, water absorbs gases, and when it falls to the earth as rain it percolates through strata or flows over surfaces in some degree soluble, and dissolves quantities of solid matter varying from 3lb. to 50lb. in every 100,000lb. of water. The Commissioners give the following as the chief characteristics of unpolluted water :—"It is tasteless and inodorous, possesses a neutral or faintly alkaline re-action, rarely contains in 100,000lb. more than $\frac{1}{2}$lb. of carbon and one-tenth of a pound of nitrogen in the form of organic matter, and is incapable of putrefaction even when kept for some time in close vessels at a summer temperature."

This water may be spoiled in its passage to the sea in many ways, which may be brought under two general heads, "Sewage" and "Manufacturing Refuse." Sewage is a very complex fluid. A large part of its most offensive matter is human excrement, and also urine thrown down gulley holes; but, mixed with this, there is the water from kitchens containing vegetable and animal refuse, and that from wash-houses containing soap and the animal matters from soiled linen. There is also the drainage from stables and cow-houses, and that from slaughter-houses. In fact, say the Commissioners, sewage cannot be looked upon solely as human excrement diluted with water, but as water polluted with a great variety of matters—some held in suspension and some in solution—but both present in such a condition as to render it impossible, in the present state of our knowledge, practically to cleanse and purify sewage so thoroughly as to make it safe for drinking even when largely diluted with unpolluted water.

A great deal of the manufacturing refuse is passed into the sewers as the readiest way of getting rid of it, and then it merely adds other ingredients to those already passing down them; but where the manufactories are situated on or near a stream, and the water made use of in the process of manufacture is afterwards transferred directly to the river, polluted by admixture with the special matters used in the different processes, such refuse matters can be treated separately as manufacturing pollution. These may be classified thus: Pollution by dye, print, and bleach works; by chemical works; by tanneries; by paper making; by woollen works; and by silk works.

Of the different kinds of pollution affecting rivers, animal organic matter as it occurs in sewage is that which renders water not only most offensive to the senses, but most likely to injure health, both by its gaseous emanations and its deleterious effects when used as a beverage. Rivers so polluted frequently contain from 1lb. to more than 2lb. of organic carbon, and from 1-3lb. to $\frac{3}{4}$lb. of organic nitrogen, in 100,000lb. Pollution by vegetable organic matter, such as that caused by dye and print works, stands next as regards offensiveness, water so polluted being excessively unpleasant not only to the sight, but in warm weather to the smell. It often contains twice as large a proportion of organic carbons as sewage water does, but owing to the smaller proportion of nitrogen in vegetable substances it rarely contains more than 1-3lb. of organic nitrogen in 100,000lb. of water.

Chemical works contribute chiefly mineral impurities, which often communicate to water extreme hardness and other disagreeable and even poisonous properties.

Having reviewed the remarks of the Commission on good water and bad, let us see what they say in respect of rendering polluted water good enough to be allowed to flow into any river or stream from which it is not intended to take water immediately for domestic use. The prohibitory standard is as follows:—

(1). Any liquid containing, in suspension, more than three parts by weight of dry mineral matter in 100,000 parts by weight of the liquid.

(2). Any liquid containing, in solution, more than two parts of weight of organic carbon, or 3-10 part by weight of organic nitrogen, in 100,000 parts by weight of the liquid.

(3). Any liquid which shall exhibit by daylight a distinct colour when a stratum of it, one inch deep, is placed in a white porcelain or earthenware vessel.

There are other stipulations which apply more particularly to certain manufacturing towns, but as applicable to towns in general the above are the most important ones.

This standard can be attained, says the Commissioners, by the present known methods of filtration, either through soil in the way of irrigation or through filter beds. The Commissioners regard the irrigation of land with town sewage in a different light to that in which it has been usually regarded. They say that the purification of sewage by irrigation takes place when it passes *through* the soil to a considerable depth, and not merely, as has been often said, by running over its surface. The Commissioners find that the filtration of sewage through either porous soil or sharp sand has the same effect in purifying it that irrigation has; that is to say, it purifies it to a degree which makes it admissible into rivers or other streams such as we have mentioned. The only difference between the two processes, viz., simple filtration and irrigation, is that the former is not remunerative, while the latter is so. Of course, the advisability of adopting one or the other method will depend in any town on the facility for acquiring land for the purpose of irrigation. Where that can be done at a reasonable outlay it is the better method, but where land cannot be had the other method claims attention.

It is curious that so many attempts to filter sewage having failed, this simple method of dealing with it should be the one at last recommended by the Royal Commission; but when we consider the manner in which such attempts have been made, it is clear that it is not filtration that has been wrong but the mode of filtering. There are three ways of passing water through a filter bed—(1) horizontally, (2) upwards, and (3) downwards. Both the former methods have been tried and have failed, for good reasons given by the Commissioners; the latter method, however, is the one they find to effect a purification of the sewage. When water or sewage is passed upwards or sideways through sand or other filtering material, the interstices become full of liquid but devoid of air; whereas, by downward filtration, after shutting off the sewage from one bed and turning it on to another, and so on alternately, which would be the method adopted in practice, the air follows the last of the sewage down into the sand, and thoroughly permeates it; and when sewage is again turned on to that bed it encounters air in its descent and becomes oxidized or purified to the degree recommended by the Commissioners as admissible into rivers. It is not difficult to see why this latter method should be so much better than either of the others. By this method the matter held in suspension in the sewage is arrested on the surface, where it can be easily got at for removal, while by the horizontal method the solid matter lodges amongst the filtering materials and fouls it, and by the upward method the same matter lodges underneath the filter bed, and is difficult to be got at for removal, besides the inconvenience resulting from the lighter particles of it being carried up into the filtering materials and fouling them.

The inquiries into the pollution of rivers in Lancashire were expected by the Commission to result in some practical conclusions upon the influence of such rivers on the health of the people, and questions were addressed to all the municipal bodies and Boards of Health within the Mersey and Ribble districts whether the river, stream, or canal passing through or by their town was a source of ill-health or discomfort; and having before them the opinions of the authorities on this subject, and having also the actual statistics of mortality within their respective jurisdictions, and information on the density of population, on the number of cellar dwellings inhabited within the place, the provision of water-closets and privies, the sufficiency of the water supply, and other points bearing generally on the health of the people, and having made themselves acquainted with the condition of the running waters throughout the district, the Commission are not able to say whether the liability to ill-health in any town is influenced by its proximity to a filthy river. This is partly owing to the incompleteness of the health statistics laid before them; but, besides this, it was with astonishment the Commissioners found that Boards of Health in several large towns, and many smaller ones, were not able to inform them of the death-rate within their districts, still less to give them information of the health within particular divisions of those districts.

WORKMEN'S INTERNATIONAL EXHIBITION.

THE organised efforts of working men for their own improvement, whether in trade, in political representation, or in their social condition, have become rather a feature in the present age. We hear, and consequently we think, more about the working classes than we were wont to do; and whether the movement we refer to is due only to a band of noisy agitators for working men's rights, or is the result of deeper and more genuine effort on the part of the whole body, we cannot but marvel at the changes it has effected in a comparatively short period of time. The same spirit which in one place has given us strikes, in another, properly directed, has produced an international exhibition, and such a result as this is sufficiently surprising. Those who have watched the growth of exhibitions—and especially international exhibitions—since the first success in 1851, will long before now have become heartily weary of them, and we must confess that we started for the Agricultural Hall rather in this frame of mind. The promoters of this gathering have laid great stress upon a point of really very little importance, except to the men concerned—namely, that all articles should bear the name of the actual workman or artificer engaged in their production, and they have determined to award no prizes except to the men themselves. Now, from an exhibition point of view, we little care, so long as a thing is really good of its kind, what workman made it if we know that it is to be obtained of Messrs. So-and-so. Of course, in objects requiring great art and skill in their production, it may be interesting to know the name of the artist; but the names of a string of men engaged on a kitchen range, a pocket knife, or a saddle, carry with them no interest, and convey no information except to half-a-score of men working in the same shop, though the publication of these names may perhaps do good in stimulating the men and encouraging them to further exertions by making them take a pride in their work. But the promise of furnishing us with the names of the men is but very poorly fulfilled; in fact, we should say it was the exception rather than the rule—some of the foreigners, be it observed, having complied with the regulation better than the English exhibitors.

The Agricultural Hall, although in our mind inseparably connected with cattle shows and live stock, is not at all a bad building for an exhibition; and if the roof was only so contrived as to keep the rain off the goods it would be as fit a building for the purpose as any in London. On the morning of our visit, and during a heavy thunderstorm, the whole place was dripping, and the poor foreigners running about and wringing their hands. The main entry is far from imposing, as the visitor finds himself opposite the under side of the orchestra, which the authorities discovered to be unsafe the day before it was wanted for the opening ceremony. A new platform had to be erected in front of this, which still remains to monopolise a great part of the space, and to cover, as far as possible, the empty floor space, for the hall is far from full, and the exhibition has an air of incompleteness and disorder which is very distressing. Now, with no wish to be severe upon the authorities, we must point out one or two matters to which, if the thing is to succeed and to be a credit to them, they must immediately direct their attention. Firstly, the catalogue is practically useless, and ought not to be sold to mislead the visitor; surely by this time they ought to have something ready and fit for use. It is too late to say anything about classification, which has apparently received no attention at all, but the labelling should be put in hand at once; many of the objects are only distinguished by their direction card to the committee, and many more have no distinguishing sign at all. With regard to the objects, of course in such a display it is impossible to avoid some contributions, but we think that a little discretion would have saved the committee from a needlessly large proportion of things which should never have been admitted—gentlemen with ingenious models which play wonderful tunes on the deposition of a penny in the hole in the roof, penny peep-shows, vendors of cheap sweetmeats and bad scent, wonderful needles, and invaluable household cements. Then there is a large class of objects which claim our attention merely from the fact of their being made of materials of which they have no right to be made — pictures in shavings and wool-work, ruins in shells, and flowers of fishbones; more objectionable than all, a class of petty tradesmen and toy sellers who pester you to buy sixpenny trumpery, and who, if you are rash enough to stop opposite their stalls, feel insulted if you do not buy something. Why not move them all into a corner of the gallery by themselves, and constitute them a chamber of horrors at twopence extra? After a careful examination of the display, we came to the conclusion that it might be divided into two classes—things done by untaught workmen which would have been better done by skilled artizans, which were, in fact, "very good considering;" and, secondly, the ordinary run of objects which one meets with in exhibitions, differing from them only in the mode in which they are labelled. Now, of course, the former class is the more distinctive one as a feature of the display, and it is with this class we have to find the most fault. If a carpenter be a good workman, and choose to devote his spare time to making some piece of wood-work or furniture which shall be taking him a little above and beyond his ordinary sphere of work, we should be the first to applaud his effort and to reward him in any way in our power, but if he devotes his energies to making a lock, or some piece of metal work which any smith would do infinitely better, and with infinitely less trouble, we should deny to him all praise for his undertaking. There is a certain class of men who are constantly trying to do skilled work other than that to which they have been trained, and the Agricultural Hall abounds with the productions of these men.

When we had occasion to notice the drawings sent up by the School of Art students we did not, as we might have done, allude to the occupations of the prize-winners. We might have shown that plasterers, carpenters, and labourers, properly taught, had sent up some of the most careful works; and it is painful with these drawings in view to see the misdirected art efforts of working men in this exhibition. In fact, the art at Islington is most deplorable. From the wretchedly bad sculpture in the hall we get to the pictures in the gallery, which are worse. The Pantheon, which usually contained a collection of second and third-rate works, was a heaven of excellence compared with the trashy collection of furniture paintings on these walls. What on earth have they to do with working men, or in what way did they get into the exhibition? They will do more harm in vitiating the taste of the visitors than the rest of the exhibition will do good in improving it.

But we must pass on to a brief consideration of the foreign goods in the exhibition. The countries appear to be disposed in strips extending transversely across the building. France is represented by an enterprising vendor of cheap coffee, backed up by the proprietor of an ingenious contrivance for using it. Denmark sends some very nicely designed pottery in imitation of Etruscan ware. There was no exhibitor's name to the stall, and no label, in fact, of any description. The goldsmiths' work exhibited by V. Christesen is very beautiful, and the combination of the precious metal and the use of oxydized silver very appropriate. From Denmark, also, we have some first-rate marqueterie work and some wonderful ivory carvings for the royal chapel. The latter are the work of J. L. Griesing, in the employ of Messrs. J. G. Schwartz and Son, of Copenhagen. The objects contributed by Italy are of a very costly character, and savour very little of the working-man element. Thus we have the most elaborate Florentine marble mosaic tables, and a costly cabinet with inlays of precious marbles and lapis lazuli. The Roman mosaics set in brooches and trinkets are all labelled in great red prices for sale, and look more like show goods in a shop window than objects in an exhibition. The same remark applies to the cameos, which are certainly remarkably cheap. The carved wood-work on the other side of the hall is perhaps the best work of the kind in the exhibition, but we were sorry to see so much time and skill wasted upon the copy of a design for a ruined arch. From Bavaria we have the usual work in buckhorn and the fret-saw work already so well known, and stowed away near the refreshments are some interesting objects from the Netherlands. Why they are banished in this way from the other foreign countries we cannot imagine. Perhaps the committee felt that until their country was annexed their geographical position was uncertain.

It may perhaps assist the visitor, in the absence of any guide, to state that we have discovered traces of some foreign country or other in a remote angle of the gallery, and that we have reason to believe that France makes up for her deficiencies down stairs by selling fancy flowers near the peep-shows. A thin belt of objects, dividing the hall into two nearly equal portions, is contributed by the Government of Bombay, and, except that we miss its special reference to the aims of the exhibition, it affords an excellent idea of the various branches of native industry. From the colonies we pass on to the mother country, and here there is too much to do justice to in a single article. Much that we have said of the exhibition generally applies specially to England. Indeed, the works of the foreigners are upon the whole better labelled, managed, and displayed than those of our own countrymen, and we believe that this is entirely due to the better organization to which they have been subjected. Of course, in foreign countries, a committee was formed for the reception and despatch of the goods, a Government or municipal grant obtained for the expenses, and some one was made responsible for the display as a whole. Now what strikes us most forcibly is the absence of any such organization on the British side. Nobody has to see that the things are properly cared for and arranged, and the consequence is that, except in the case of a few large firms who have gone to considerable expense in displaying their work, the bulk of the objects are in confusion. It is as if a few men—quite ignorant of the difficulties and obligations of an exhibition—had taken a big room and let anyone come in and do as they liked; and the sooner this impressson, which was unavoidably forced upon us, is removed, the better it will be for the chances of success. We may mention, in conclusion, a few of the objects which attracted our attention. Mr. J. T. Wilson has an oak lectern and pulpit, designed and executed by himself; the carving is very fair. The pulpit, we notice, is incomplete. Messrs. Hampton and Son show a drawing-room chair, designed by B. Lucraft and executed by J. Walker. The design is peculiar, from the use of carved stays between the seat and back to give extra strength, and the introduction of a monogram painted on plate glass as a panel in the centre of the back is curious. Messrs. Moseley and Company exhibit their electric bells. Messrs. Cox and Son have some very good ecclesiastical furniture and metal work. We noticed a double-top engraved lectern, which is assigned to the following workmen: makers, J. Shelley and J. Wilson; engraver, H. Sallows; polishers, J. Price and W. Price. Perhaps the most thorough display in the exhibition is that of Messrs. Mappin and Webb—the names of the workmen in every branch of trade being most carefully attached to each object. Thus, a gilt cake-plate, price £8 8s., is the work of the following men: designer, Jefferson; modeller, Barratt; caster, Garrad; raised by J. Stanbrook; chased by Harrison; engraved by Davison; mounted by J. G. Simester; polished by J. Salt; plater, Millwood; superintended by W. Duddleston. On the same card are also enumerated the following trades which do not apparently come into operation on the object in question: stamper, embosser, spinner, and finisher. The excellence and finish of all the articles shown by Messrs. Mappin, and the artistic manner in which they are displayed, deserves the utmost commendation. Messrs. Blews and Son send some very good wood-carvings.

The furniture, upon the whole, is poor and below the mark, chiefly owing to the absence of good design—a point in which work of this kind too often fails. There is a very good wardrobe of Roberts's firm: F. Tavener, joiner, and J. Waymark, polisher; and an oak panelled door, with no names of exhibitor or workman.

We cannot now go into the machinery, some of which is very interesting; and we must reserve for a subsequent article what we have to say on the subject of graining, in which branch there is a strong competition. We see from the catalogue that there is to be a workshop competition, but we fear that the committee will find this a very awkward matter to arrange. Although we have been compelled to find a good deal of fault with the management of the exhibition, we should be sorry to condemn the display itself. Those who are accustomed to go through collections of this kind will soon find out the interesting objects; but our chief complaint is that this has not been done for us beforehand by some competent judges. Finally, we would impress upon all those who are interested in workmen and their doings to go and form their own opinion upon the correctness of our strictures, and above all to take warning here and avoid the danger in any future working man's exhibition of collecting the productions of workmen in their idle hours instead of the masterpieces, if we may so call them, of their own legitimate handicraft.

SUNDRY DECORATIVE WORKS AT THE KENSINGTON MUSEUM.

IN examining some of the other decorations at the South Kensington Museum, a question ot some importance meets us at the threshold. This is, whether or not the ornamentation of an apartment should bear any particular relation to its contents, and if so, should or should not this be in strict harmony with them? The South Kensington authorities, and those whom they have employed, have by their works answered this question in the affirmative; we, on the contrary, are inclined to do so in the negative. We do not mean to contend that artists should not take for illustration subjects which bear upon the processes or the history of the art manufactures to which a special room or gallery is devoted, but that we think it is a mistake to imitate throughout its ornamental details those of the objects exhibited within it. Thus we should not wish to see the Elgin marbles housed in a place richly embellished with the hackneyed Greek ornaments of the honeysuckle, &c., or the sphinxes and caryatidæ of Egypt in one dressed up with those adopted from the leaves of the lotus. Consequently, we consider Mr. Owen Jones has erred in endeavouring to give an Oriental aspect to the portion of the exhibition in which the cases of draperies, dresses, and arms from India and Turkey, and the pottery, &c., of China and Japan, are shown. In the first place, however excellent the design of such decoration may be, it is next to impossible to find English workmen capable of executing it with the same freedom and grace as the cunning craftsmen of the East, in whose families, from generation to generation, the secret, or, at least, the peculiar skill of the separate branches of their delicate fabrics, has been preserved. Either the decorated walls and ceilings which surround such objects, or the fabrics themselves, or both, must suffer by the comparison so forced upon the spectator, and we do not hesitate to say that it is the occidental imitation that goes to the wall in this competition, but, unfortunately, not without inflicting an amount of injury, though not a corresponding one, upon those precious Oriental objects of *vertu* themselves. After all that can be, and is, justly said in the praise of these works, the simplicity, and what we may call the low aim of Eastern designs, is apt to pall upon and create a satiety in the minds of spectators; and we have often found, after an inspection of the beautiful Indian Museum at the India Office, that the interminable repetition of diapers and other linear arrangements becomes slightly wearisome. It is the exquisite refinement in their texture and coloring that is their enduring charm. It stands to reason, therefore, that if, besides varieties of shawls, our eyes whithersoever we turn them are met by the oft-recurring shawl patterns above, below, and around us, executed without the same degree of refinement and beauty of coloring possessed by the originals, we end with a mental recognition that

> Of patterns rounded, patterns square,
> Of patterns pretty, patterns fair;
> Of chasings smooth and chasings rough,
> We thank the Indies we've had enough.

Another practical disadvantage of this decorative treatment of the space referred to is that the delicacy of the work appears to be thought so liable to injury from the fumes of gas that this portion of the museum is seldom lighted up in the evening, the very time when the articles displayed in it would under this artificial light appear to their best advantage.

On the whole, we think there is but slight doubt that the decoration of buildings or apartments destined to contain pictures, statues, or objects of rich and beautiful workmanship should be restrained and kept in subordination. It need not be poverty-stricken or bald, but it should be quiet and refined; and there should be no attempt at either imitation of, or competition with, the character of the contents, and the colors chosen should be such as would enhance by contrast those of the objects exhibited. Such has been the judicious aim of the decorators of the New Royal Academy saloons, and such we should recommend for all similar purposes. Are we by this limitation imposing an undue restriction upon the talents and efforts of designers? Not so; there is ample space in every public building, and certainly there is at South Kensington, for their employment and encouragement, and their work could be wisely confined to such apartments as the refreshment-rooms, and the staircases, corridors, &c.

Perhaps we ought to except from these remarks the treatment of the alcoves in the large court. The whole of the South Court is arranged more ornamentally than the rest of the Museum, and there are comparatively fewer objects in it, and spectators feel, as it were, that they have leisure to look about them, and therefore the alcoves, as they are called in the guide-books, or arched recesses in the upper portion of the walls, can claim a fair share of attention. Fourteen of these on each side are intended to contain portraits of eminent men of all ages connected with the arts. These pictures are in mosaic, and from the cartoons of some of the most celebrated of the artists of the modern English school.

The opportunities of this character that have been afforded to painters have been so few of late years that their efforts are necessarily tentative and experimental. Even the material is novel to them, and therefore great allowance should be made in any criticism as to the result. It seems to us that though mosaic is an enduring and admirable material for decoration, it needs broader and bolder treatment than it has here received, and the backgrounds should be more varied and broken in tint. It appears almost as if it were going to useless trouble to compose them of small tesseræ if these be chosen of so uniform a tint that the result looks as if it had been cut out of gilt paper and scored with a few lines. However this may be, their pictures can really only be looked upon as paintings in a gallery—a series of historical portraits—and not as examples of decoration. They, and Mr. Godfrey Sykes's colouring of the construction, are but little in harmony. Similarly out of unison are Mr. Moore's clever proscenium at the Queen's Theatre and the patterns and colouring which surround it. It is useless to expect to obtain a satisfactory general result by the combination of separate works even by the ablest hands; one master-mind must direct and control the whole. Pictures are one thing and decoration is another, and the two cannot well be combined in the same apartment. Pictures are rightly isolated in frames, and need a quiet and unobtrusive background. Decoration is a picture in itself, and will not bear interruption or the interpolation of others in its midst. These principles need to be borne in mind in the treatment of domestic interiors. We have lately seen a tolerable compromise when in lofty rooms a band of decoration like a frieze is continued round them immediately below the ceiling, and upon space intermediate between this and the dado, purposely left a quiet tint, pictures are arranged; but this, at best, is but a compromise. Each part is alone satisfactory when viewed by itself, and, as a whole, no very charming effect is the result, the two classes of painting clashing more or less.

Leaving, however, for the present these larger courts, as our space is limited, we will glance for a moment at one of the newer galleries above. When we enter the Ceramic—we beg pardon, and bow to South Kensington authority and say the Keramic—Gallery we are again met by the attempt to make everything correspond, and with the feelings of the ancient mariner, when nought but water met his ken, we begin to look with dismay upon the crockery, crockery, everywhere. Our old friends, the porcelain-cased columns, of which we had had quite enough in the Central Refreshment Room, present themselves again here *apropos* of the contents of the Museum, and certainly, in our opinion, appear to still greater disadvantage than those in the room below, for among the old specimens of Flanders, Persian, and Chinese earthenware their cold and glistening crudity becomes painfully obtrusive. We much prefer another rather original attempt at decoration which has been made in this gallery in the method of lighting. Two powerful burners have been placed outside the semicircular windows which occupy the heads of the arches of the several bays, and the glass has been painted with designs by Mr. W. B. Scott, the artist, who has produced a thoughtful and well-considered scheme for the subjects. These paintings will thus be visible by day and by night, and the tempered light thrown by these windows upon the interesting objects with which this gallery is filled is especially pleasing. To this series of glass paintings we intend to recur upon another occasion, as they well deserve more careful examination than we have as yet been able to devote to them; to such opportunity we defer, therefore, any further remarks on this subject.

◆

SOUTH WINGFIELD MANOR, DERBYSHIRE.

MR. EDMUND B. FERREY has been fortunate in his choice of the subject of this monograph, and has done excellent justice to it. South Wingfield Manor is, as he says, a charming old manor, one of the most interesting in Derbyshire, which, though now in ruins, still has a very considerable part of the architectural portions of the building remaining in an admirable state of preservation. To its present possessor, the Rev. Imanuel Halton, the thanks of the public, as well as of architectural students, are greatly due for this condition, as that gentleman takes a proper pride in this, his interesting heirloom, and has removed the ivy with which some years since it was unduly overgrown; this is now kept within reasonable bounds, and not suffered to do damage to what is left of the structure. This manor-house is said by Camden to have been built by Ralph Lord Cromwell, Lord Treasurer of England in the reign of Henry VI. It somewhat resembles Haddon Hall in the great irregularity of its walls and the position of the various buildings in relation to each other, but must in its prime, as Mr. E. Ferey says, have excelled that ancient and better known mansion. It possesses strong historical interest and associations from its having been for several years the place where the unfortunate Mary, Queen of Scots, was imprisoned.

The general style of this building is "Transitional" from the Decorated to the Perpendicular Gothic, although some parts are pure Decorated and a few Early English, with later additions belonging to the date of the sixteenth century. For any further details of its history we must refer to the descriptive pages of our author. The buildings are arranged around two quadrangular courts; the outer or south one about 200ft. long by 150ft. broad; and the inner or north one about 150ft. by 100ft. The principal group occupies the whole of the north side of the latter, and contains a noble banqueting hall 72ft. by 36ft., with an external porch of two storeys, and a fine lofty bay window at the eastern end of this apartment. There is a groined crypt below, which was probably used as a retainers' hall. Another fine state apartment, at right angles to the banqueting hall communicated with it, and had another spacious room under it. To the west of these are the kitchen, the buttery, and offices; and to the east, but at some distance, was a chapel, with a cloister of connection with the main buildings. Along the western side of the north quadrangle was the range of apartments occupied by Mary, Queen of Scots, but these—though averred by Blore to have been the handsomest portion—are now destroyed; and on the south side, dividing their inner quadrangle from the outer one, is a picturesque entrance double gateway, the porter's lodge, and a lofty tower at the north-west angle. A corresponding tower formerly existing at the north-east angle is shown in Blore's views, but fell down some years since. The entrance gateways form one of the earliest parts of the structure; the arch mouldings are bold, being simply quirked rolls, and the effect of this range of buildings from the outer south quadrangle, with its numerous and boldly projecting chimney-stacks, is striking. On the east side of the south quadrangle is the guards' chambers, a building 116ft. by 25ft. internal dimensions, with rooms above; and another entrance gateway and porter's lodge in the south-eastern angle, to which is attached an interesting ancient barn, which is continued along the south side of this quadrangle, and is 71ft. long by 30ft. wide within. This has substantial buttressed walls, but its massive oak roof is carried, independently of them, upon large and strong oak posts. The care with which this interesting relic of Mediæval domestic architecture has been represented in this monograph does Mr. E. Ferrey great credit. He vouches for the accuracy of all the dimensions given, and for the truthfulness of the sizes of the stones and character of the masonry, as having been plotted upon the spot—a point to which too much importance cannot be attributed. As we think the work throughout bears evidence to the correctness of this statement, we shall hope to see some other of our unpublished architectural relics illustrated hereafter by the same hand.

THE NEW LAW COURTS AND THE NATIONAL GALLERY.

THE four money votes granted by the House of Commons on Tuesday evening have attracted little attention in comparison to that which would have been bestowed upon them in the earlier days of the session, when no foreign complications claimed the attention of the Government or presented themselves as likely party questions to the Opposition leaders. Possibly, had this not been the case, we might have been favoured with another year's delay in the erection of the New Law Courts, accompanied by a further loss of public money to be added to the £900,000 already spent. After about twelve years' delay a commencement is now really to be made; £21,450 has been granted for the excavation of the site and laying some of the foundation work, which will scarcely be completed by the time Parliament reassembles. So far it is satisfactory to know that the thing is finally settled, and that the best man will be allowed to erect the best building on the best site. The visions of Thames Embankment gentlemen, who imagined that they championed the wishes of "All England against Lincoln's Inn," and the lawyers—who, of course, could not be supposed to know which site suited them best—are at last dispelled for ever, and the plans of Inigo Jones may be left a little longer in the possession of the Chancellor of the Exchequer.

There is little worthy of notice in the National Gallery vote of £37,250 beyond the rather curious clause that the building is to be erected from the designs of Mr. Barry "in the event of his subscribing to the conditions of his employment." If the National Gallery is rebuilt at all, Mr. Barry ought to build it without any unusual conditions imposed upon him; but we shall rather welcome any occurrence which may prevent what we have all along maintained to be an unnecessary expenditure of public money.

The New Home and Colonial Offices, to be added to the recently built Foreign Office by Mr. Scott (who, together with Mr. Street, does not seem to be required to "subscribe to conditions of employment"), re-awaken the old regret at Lord Palmerston's art tastes which overruled the truer instincts of Mr. Scott, and while giving each of the three great architects an opportunity of stamping his name on the art-history of England, tied the hands of one of them equally to the disadvantage of him and his art.

Another exodus from the British Museum to South Kensington—the Promised Land apparently of all appertaining to Art and Science comprises this time the Natural History Collections. While it is quite clear that the British Museum must be cleared of some of its contents, if the rest are ever to be looked at at all, it does not seem naturally to to follow that South Kensington should receive all the surplus treasures. It is one comfort, however, to think that, under the directions of some future less rapacious manager than Mr. Cole, South Kensington itself may be considered full some day, and then ,possibly, the Government may see their way to the acquirement of some site for the erection of a museum not quite out of the reach of everybody but the favoured inhabitants of the Court Suburb.

ROYAL ARCHÆOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND AT LEICESTER.

ON Tuesday week, after their visit to S. Martin's Church, under the guidance of Mr. J. H. Parker, F.S.A., the members met in the evening at the Masonic Hall at half-past eight, under the presidency of the Ven. Archdeacon Trollope, the Chairman of the Architectural Section. The first paper read was by the Rev. J. G. Joyce, "On the Stained Glass Windows in Fairford Church, Gloucestershire."

The Lecturer said pictures of the same were to be seen in the temporary museum at the Free Library. These cartoons of the stained glass were about to be placed in the South Kensington Museum. As to how the stained glass became to be placed in the church, he noticed that Fairford Church was a rebuilt structure (not recently) of the Perpendicular period. The construction was peculiar, and showed the motives under which the church was built. It was rebuilt in 1494, the donor being John Tamer, Esq., lord of the manor, to whose memory a tomb was erected in the building. John Tamer, Esq., was a trader in flannels, and it was alleged by tradition that the glass came to Fairford Church through it having been pirated across the Channel in a vessel captured by one of Tamer's vessels. He had no doubt that a portion of the glass, if not the whole of it, so came into the possession of Fairford Church. The sunken panels in the church were like the panels in the glass, and in other portions the architectural features corresponded with the glass. There were twenty-eight subjects, and the sizes of some of the pieces of glass were surprisingly large. Several parts were wanting to the figures, while other pieces were "starred," and liable to fall out of their crazy fastenings. He then went on to notice the subjects in the windows, one being the admission by S. Peter of persons up the golden steps of Heaven. This glass has obtained great fame on the Continent, and the learned lecturer proceeded to notice that many years ago similar windows were to be found in a church at Hershau. Every one of the subjects showed an art tradition. There could not, he thought, be a greater mistake than for it to be said, as had been stated, that both the design and the execution were by the same persons. The great west window, especially the lower part, was impressed with the Mediæval character—the toes of S Peter particularly so, being elongated, while the legs of the woman beseeching S. Peter to admit her to Heaven were also too elongated. Several other points he noticed as representing a Mediæval character, and contrasting very much with others of the pictures. The twelve Prophets were done by the same hand, but not the painting of the glass. He could not attribute the glass to Albert Durer, as in all the architectural details he was more classical. The whole of the glass had been fitted to a Perpendicular tracery. The drawing of the horses, the nimbus, and the hands and feet also showed that Durer did not draw the pictures. He then reproduced some figures containing the signature "W. A.," which he said approached the nearest to the Fairford glass of any he had seen, although he could not tell its author. This corresponded in most of its detail excepting the drapery. The Fairford glass contained great dignity of form and exquisite colouring, and a large proportion of white light, and he considered it highly desirable that the Government should become possessed of the tracings for the benefit of future ages in the matter of church windows.

In the discussion which followed, Mr. Clark thought it very improbable that the glass had been taken out and buried for a time, as if it were the places would have to be filled up in the interim, while the quantity of stained glass in that locality did not seem to indicate that there was any great wanton breakage of stained glass at that period. He thought in Fairford Church they had some of the best kinds of glass painting. —Mr. Mackay thought they might rejoice at the windows being copied for the purpose of being placed in the South Kensington Museum. He considered the work as that of a profound artist, but that it had been attributed to Albert Durer more for his fame as a distinguished artist than for there being any foundation for assigning it to him. He highly approved of the windows as good specimens of glass for use in church windows. —The Ven. Chairman thought the glass had been made for the church, and that undoubtedly it had been produced by two artists. He then called upon Mr. Thompson to read his paper on "The Jews and the Jewry Wall."

This paper was an interesting description of the old fragment of Roman masonry in Leicester, known as the Jewry wall, which, as Mr. Thompson pointed out, was probably in the Early Mediæval period surrounded by Roman ruins—a place where no Christian would care to intrude, yet deemed good enough for the residence of the persecuted children of Israel who, as in all large towns, where limited to a particular district.

On the following day (Wednesday) a meeting was held in the Masonic Hall, Lord Talbot de Malahide presiding, when Archdeacon Trollope delivered an introductory adddress, eulogising archæology, and encouraging the younger students of the science to increase their knowledge by attendance at such gatherings as those of the Institute. A paper on "Roman Leicester" was then read by the Rev. J. G. Joyce, followed by another by Mr. J. Burtt, entitled, "Contributions to the History of Leicester Abbey." In the afternoon a large party met at the Castle, where the Deputy Constable, W. Napier Reeve, Esq., was in attendance to receive the guests. The company assembled in the Crown Court, where Mr. Reeve, having opened the Duchy of Lancaster's Court in due form, proceeded to deliver an address explanatory of the history of the Castle. In the course of his remarks he slightly adverted to the Saxon story, and to the alleged foundation of the Castle by Ethelfreda, the daughter of Alfred the Great, and to the presence there of Athelstan, Edward, and other worthies of the Saxon dynasty, and especially to the Lady Godiva. Mr. Reeve proceeded to the Norman, or as he called it, the historical time—tracing out the succession of the Norman earls. Mr. Reeve then traced the history of the Castle till the earldom became emerged in the Crown of England, and referred to the charter now in the Museum, granted by Henry V. to the Duke of York at the Castle at Leicester, two years before the Battle of Agincourt. Mr. Reeve then produced the baton of the constable, made from oak growing in the days of Egbert, and then, adjourning the Duchy Court, vacated his seat. The Rev. H J. Hoskyns, in the absence of Sir F. T. Fowke, Bart., took the seat as Deputy Chairman, and

Mr. G. T. Clarke gave an explanation of the building. He said the Court in which they were then assembled formed a portion of the fine old Norman hall of Leicester Castle, and it was a very fine specimen, and one of the very rare halls of the kind in the kingdom. Leicester Castle had evidently been a great stronghold, and of much importance, as indicated by the large size of the hall. After pointing out some Norman windows, and explaining other details connected therewith, the company proceeded to the Magazine, which Mr. Clarke explained was a gateway of the new portion of the Castle generally attributed to John of Gaunt, who lived in the time of Richard II. It was early Perpendicular work, and he believed it to have been built in the time of

Henry VII. The Mound was next visited. This Mr. Clark thought was a mound which displayed considerable military skill, as it presented an entire command of Leicester. It was not in its former condition. The river Soar in its former state was a most excellent boundary on the one side, and that part known as the Willow Bridge was a boundary on the east. If they looked at the Ordnance Map they would find that this position was stronger than any in Leicester, because it was banked up on every side, and fell towards every side of the town. S. Mary's Church was formerly the chapel belonging to the Castle, which was formerly carried beyond the garden, where was the abutment of the original wall, beyond which was the ditch. The enclosure within the precincts of the Castle was known as the Castle View. The gateway that they passed under was a good specimen of the Perpendicular style, and might possibly have been built by John o' Gaunt. There could be no doubt that it was of thoroughly Perpendicular work. The Dungeon (or Done John) was next visited, the *cicerone* being Mr. Reeve. No explanation was offered in reference to this, which is supposed from the doorway to be of Norman origin, although the arch of the roof indicates a later period, being of a pointed character. From this dungeon a staircase was traceable leading to the Castle above. The company was then conducted by Mr. Reeve through the gardens at the back, and into the Castle. Subsequently S. Mary's Church was examined. The architecture of the edifice was described; the oldest existing portion of the building was said to be a Norman arcade at the west end, the date of which was probably about 1100. The historical connection of the church was also alluded to. It was stated that it was originally used as the church of the Castle of Leicester. In the fourteenth century it was converted into a parochial church. The edifice had evidently undergone many changes, and had many additions made to it from time to time. One very uncommon feature about it was noticed—the fact that the tower was built independent of the church, and stood on its own foundations. In the chancel a rich Norman sedilia and piscina were pointed out.

Trinity hospital also received a brief visit, the Early English window at the east end being particularly alluded to, as it had four lancets, which was something unusual for windows of that character. Mention was also made of the tomb of the Countess of Derby, erected in the chancel in the fourteenth century.

Conveyances were then procured, and the party drove to the Abbey and carefully examined the excavations which have recently been made there.

In the evening the company again assembled in the Masonic Hall, when Mr. J. T. Burgess, of Leamington, read a paper on the "Last Battle of the Roses."

◆

THE S. PANCRAS INDUSTRIAL SCHOOLS, LEAVESDEN.

THE guardians of S. Pancras, finding it inconvenient to have the pauper children of the parish scattered about in different schools, some at Plaistow, some at Hanwell, and some in the workhouse, determined two years ago to erect schools of their own at Leavesden Woodside, near Watford, Herts. The building operations were commenced in November, 1868, from plans by Messrs. Giles and Biven, of Craven-street, Charing Cross, Mr. Robert Mann, of Weedington-street, Kentish-town, being the contractor. Mr. Mann's contract, which amounted to £37,545, was for the buildings only, and they were completed in April last. The works remaining to be done, and for which contracts have been entered into, are the supplying and fixing of pumps, boilers, water-tanks, fencing, school fittings, gas and water mains and pipes, heating apparatus, &c.; and the construction of roads and sewers. These works, it is anticipated, will all be completed, and the schools ready for the reception of the children, by September 29th next. On entering the grounds, the first building encountered is the receiving-ward, two stories high, and detached from the main building. This building has a frontage of 85ft., is 50ft. deep, and is well supplied with baths for both sexes. Attached to the receiving ward is a porter's lodge. The main building has a frontage of 390ft., by a depth of 190ft., and it contains three corridors, the main one being 350ft. in length, and the two side corridors 160ft. each. The dining-hall is 77ft. long, 45ft. wide, and 35ft. high to the ridge. There is also a smaller dining-hall for infants. The kitchen adjoins the dining-room. The schoolrooms are 80ft. long, 19ft. wide, and 19ft. high. The bath-houses are 50ft. long, 22ft. wide, and 25ft. high, the swimming bath being 45ft. long, 12ft. wide, and from 3ft. to 4ft. deep. The playgrounds are 150ft. long by 120ft. wide, and are partly covered. There are three floors of dormitories, and sleeping-rooms for monitors so arranged as to overlook the whole of each dormitory, and sleeping apartments for the officers and servants, partly in the roof in the central portion of the building. The dormitories on the ground floor are 12ft. high, and on the other floors 11ft. There are day-rooms for the officers, waiting-rooms for parents and friends who come to see the children, a board-room, and a committee-room. There is a water tower 73ft. high, the tank at the top holding 20,000 gallons. At the south side of the main building is the chapel, which, exclusive of the chancel, is 70ft. long, 49ft. wide, and 40ft. high to the ridge. It is Gothic in character, and is approached from the main building by a covered way. The arches dividing the nave and aisles are of red brick, springing from cast-iron columns on blue brick bases. The roof is of stained pine. The general infirmary, which is some distance from the main building, has a frontage of 220ft. by a depth of 91ft., with two stories for wards, and sleeping apartments in the central part for nurses. A short distance off, and detached, is the smallpox and fever infirmary, with a frontage of 221ft., and a depth of 76ft. This building is only one story high. Throughout the buildings the work is of the most substantial character, and the mosaic pavement in the hall of the chief entrance, and the iron balustrade to the staircase, seem to be the only attempts of a purely ornamental character. Accommodation is provided for 700 children.

◆

SUITABLE GROUND FLOORS FOR SMALL HOUSES.

IN many parts of the country it is customary to omit the cellar under a house, merely setting the frame on posts or piles raised from eighteen inches to two and a half feet above the surface of the ground. This space is perfectly useless for any practical purpose, and, being frequently left unenclosed, becomes a hiding place for animals, and, if enclosed, is productive of unwholesome gases which soon find entrance into the house through the floor, there being nothing save the thin flooring, with its occasional knot-holes, to prevent its admission. Such a floor is, in winter, very cold, even when carpeted, and the shrinking of the boards composing it soon makes a new floor unpleasant in this respect, for the tongueing and grooving is scarcely a protection against this shrinkage, especially where stoves are located. If there were a cellar it would be possible to sheathe the ceiling of it and thus make the ground floor more comfortable. But we are now speaking of those small, rapidly erected houses which have no cellar. It is always desirable to raise the ground floor out of the immediate influence of damp, and therefore we would always erect such a dwelling as we have in view on a platform of earth, say twenty inches, at least, in height and this we would level off and roll or tamp with rammers until a firm surface is produced. We would now cover this surface with common unglazed earthen pots (flower pots, for instance) with their mouths downwards and close together, filling up the intervals or spaces with pounded charcoal; then the whole platform should be coated with coarse brickdust and lime, in proportions of three of brickdust to one of lime, wetted and well mixed, and laid on quickly, say an inch thick, and left to harden. On this last we would then lay the floor-boards, tongued and grooved together as usual. The earthen pots would then be framed in, as it were, by the sills of the house. Instead of charcoal, any sort of dry rubbish may be used for filling in between the pots, but for a sanitary purpose the charcoal is best. No joists are required in such a floor as this, and in many sections of the country it would prove economical as well as comfortable. For barns and outhouses generally, this mode of flooring ought to commend itself, while the covering of flooring-boards might then be dispensed with. But, instead of the boarding, it will be necessary to make the covering or cement coat two inches thick. Where pottery is cheap, the above is a very desirable mode of forming a thoroughly dry cottage floor, or one suitable for barns, etc., as being rat-proof —no mean characteristic of a floor in such situations. For dairies and cellars it is excellent, as ensuring that great desideratum—dryness.—*American Technologist.*

◆

THE LIVERPOOL BUILDING TRADES.

THE following scheme has been submitted to the Master Builders' Association by the Secretaries of the Amalgamated Joiners' Society, the Joiners' General Union, the House Painters,' Bricklayers', Plasterers', and Plumbers' Unions:—

OUTLINE OF A PLAN FOR THE FORMATION OF A COURT OF CONCILIATION AND ARBITRATION IN THE BUILDING TRADE.

The constituency is to consist of all master builders, tradesmen, and operatives engaged in the building trade, or in any of its branches.

The court is to be extra-judicial, and to consist of an equal number of employers and employed, to be elected at an annual meeting of each body. Each branch of the building trade to send six masters and six operatives; an independent president to be chosen at the first meeting of arbitrators, and a vice-president to act in case of the illness or absence of the president.

The court to be sub-divided into three sections:—

1. A court of conciliation, to consist of one employer and one operative, to be chosen from the branch in which the dispute has arisen.
2. A court of arbitration, to consist of the president, six employers, and six workmen, representing the branch in which the dispute has arisen.
3. A special court, to consist of the president, one employer, and one workman from each branch of the trade.

The object of the court of conciliation shall be to conciliate parties in whose establishment minor disputes have arisen; should they fail in doing so the case to be referred to the court of arbitration.

The court of arbitration shall serve as a court of appeal from the conciliators, and for the settlement of differences which may arise in any particular branch of the trade.

The special court to be for the settlement of differences affecting the trade in all its branches, and a court of final appeal from the court of arbitration.

In bringing disputes before the conciliatory court the parties shall appear in person, the employer being allowed to send his foreman: should the dispute have arisen with such foreman the proceedings should be private. Before the court of arbitration and the special court the parties may appear in person, or be represented by counsel or attorney, as in the county court, and the proceedings shall be public.

The court shall take cognizance of all differences that may arise; but, in case the subject of difference be rate of wages or hours of labour for the future, then their decisions shall be binding for six months.

In all cases the majority shall decide, and if the votes be equal the president shall give the casting vote.

◆

BUILDERS' BENEVOLENT INSTITUTION.

THE twenty-third annual general meeting of the friends and subscribers of the above charity was held on Thursday (28th ult.), at Willis's Rooms, King-street, St. James's, Mr. J. M. Macey, the president of the past year, in the chair. The purpose of the meeting was to receive the report for the past year, to elect a president, treasurer, directors, and auditors for the year ensuing, and other matters connected with the welfare of the institution.

Mr. Harris, the secretary, read the report, as follows:—

"In presenting to the friends and supporters of the Builders' Benevolent Institution the report for the past year, the directors regret that in consequence of the general depression of trade, and more particularly that connected with the building interests, the receipts for the past year have suffered a slight diminution, but they hope that, with returning prosperity, and the kind assistance of their friends, they may be again enabled to resume continued and gradual increase in the funds of the charity which has, since its formation, been one of its most cheering and distinguishing features.

"An election of pensioners was held at Willis's Rooms in May last, when two pensioners, one man and one woman, were elected. The total number of pensioners is now 44, viz, 22 men and 22 women. The pensioners last elected were Mr. Richd. Burdett and Mrs. Martin.

"During the year, the following pensioners have died:—William Standfast, elected November, 1863, died Oct., 1869; Thomas Martin, elected May, 1865, died Oct., 1869; John Jenkins, elected May, 1864, died Feb., 1870; Elizabeth Rees, elected May, 1851, died Oct., 1869; and Mrs. K. Edmunds, elected May, 1860, died Dec., 1869.

"The amount of stock, Three per cent. Consols, purchased during the past year is £325 5s., £216 16s. for the Relief Fund, and £108 9s. for the Building Fund, making a total of £15,075 14s. 11d., viz, £11,923 5s. 8d. for the Relief Fund, and £3,152 9s. 3d. for the Building Fund.

"The directors earnestly appeal to their supporters to increase the funds of the charity by endeavouring to obtain amongst their friends and connections additional annual subscribers, so that they may be enabled to elect more, if not all, of the candidates who are so anxiously looking forward to receive the benefits conferred by the Builders' Benevolent Institution."

The report was received and adopted, together with the appended balance sheet.

Mr. Plucknett moved a vote of thanks to Mr. Macey for his performance of the onerous duties of president for the past year, which he had carried out with the greatest satisfaction. This vote was unanimously passed, and it was announced that Mr. A. J. Mansfield had consented to become President for the ensuing year.

◆

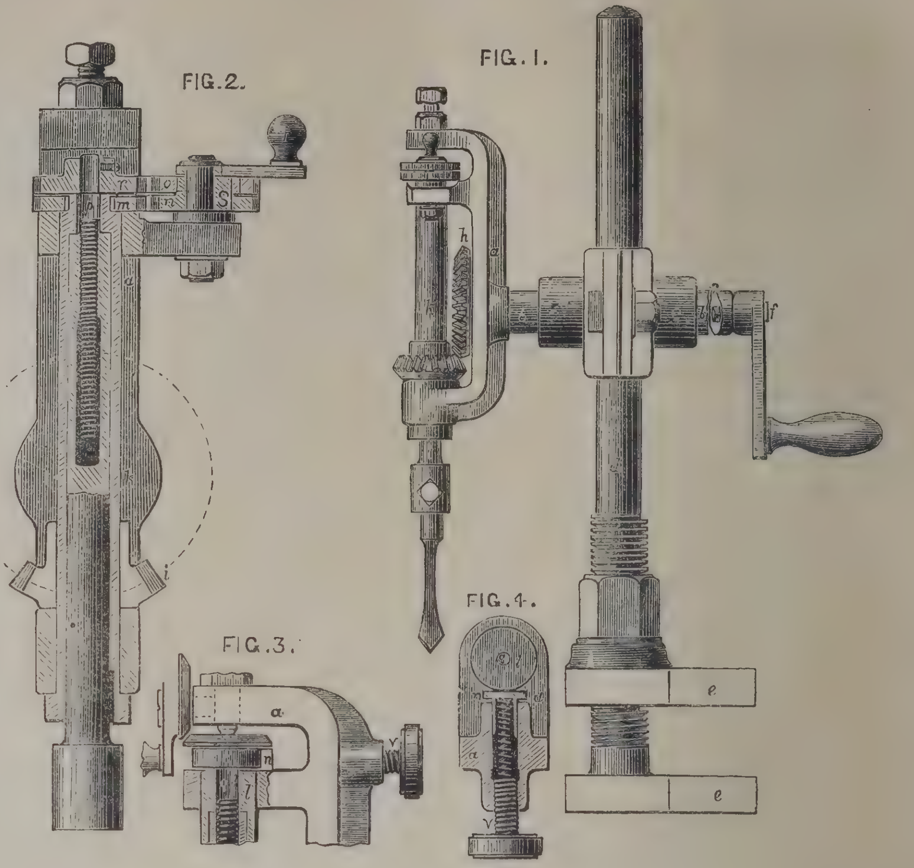
PORTABLE DRILLING MACHINERY, Etc.

We give this week, as a subject for illustration, the invention of improvements in portable drilling machinery, patented by Messrs. Spencer and Consterdine, of Hollinwood, near Manchester.

The invention is designed for the purpose of producing a portable self-acting adjustable feed drilling tool, that can be readily adapted and "clamped" to heavy pieces of machinery or iron bridge work, for the purpose of drilling or boring holes in the same at a speed proportionate to the class of drill and work acted upon. The improvements may be described as follows:—

A frame is provided for supporting the drill spindle and holder, which is secured to a long projecting horizontal boss, in and through which the shaft driving the drill spindle is supported, and gives a revolving motion to the drill spindle through the bevel gearing, the horizontal boss being supported by a bearing that will allow of the horizontal boss and frame supporting the drill to be turned and placed at any angle that will adjust it to the work it is required to operate upon. The bearing supporting the horizontal boss is provided with a clip formed at right angles, that will allow of its being secured at any height upon a vertical bar, the bottom end of which is provided with adjustable jaws, by which the tool is attached to the piece of work to be operated upon. The feed to the drill, when revolving, may be accomplished by means of differential wheels, the carriers being mounted upon an eccentric stud that will admit of the wheels being thrown into and out of gear; this arrangement of driving gear will give one regular feed to the drill, but in order to give a feed to the drill when revolving according to the class of hole and work it is operating upon, the internal screw is actuated, giving the downward motion to the drill by means of a disc secured to the internal screw, and against the periphery of which, whilst revolving, a yielding pressure is exerted that can be adjusted by a set screw to give any amount of frictional resistance desired, thus enabling the feed to be diminished or accelerated in accordance herewith.

Fig. 1 represents in elevation the drill supported by its swivel bearing on the vertical rod, supplied with "clamps" for securing the drill, and adapting it to the metal it has to operate upon. Fig. 2 represents in vertical section the drill spindle and its actuating screw, employed through the medium of the differential gearing to give a uniform feed to the drill when revolving; fig. 3 represents a detached front section of the top portion of the framing and feed screw, in which is shown an arrangement of friction wheel secured to the actuating feed screw; and fig. 4 represents a sectional plan view of the same.



PORTABLE DRILLING MACHINE.

In these figures *a a* is the frame of the drill, from which the long boss *b* projects for the purpose of being supported by the adjustable boss *c* secured to the vertical rod or bar *d*, the bottom of which is provided with adjustable clamps *e* employed for securing the drill to the work it has to perform upon. The shaft *f* supplied with the handle *g* passes through and freely revolves in the long boss *b*; its extremity, projecting through the frame *a*, is supplied with a bevel wheel *h* gearing into and driving the pinion *i* secured to and giving motion to the sleeve *k* and drill spindle *l*. The sleeve *k* in figs. 1 and 2 has secured to its upper end a wheel *m* that gears into the carrier wheel *n*, which transmits motion through the second carrier wheel *o* to the wheel *p* secured to the actuating feed screw *q*. The difference in the number of teeth in these wheels slightly reduces the speed of the screw *q*, thereby effecting a uniform downward feed to the drill spindle *l* during the time it is at work on a piece of metal. The carrier wheels *m* and *o* are thrown into and out of gear with the wheels *m* and *p* by the handle *r* and eccentric position of the stud *s*.

The modification of self-acting feed shown in figs. 3 and 4 consists in securing to the actuating feed screw *q* a friction wheel or disc *t*. Against the periphery of wheel *a*, yielding pressure is exerted through the medium of the sliding piece *n* and set screw *v*; thus, according to the amount of pressure the piece *u* is caused to exert against the periphery of the disc *t* will the screw *q* be retarded, consequently giving more or less feed to the drill in accordance with the amount of pressure so exerted.

◆

NAILS FOR OUTDOOR WORK.

Every one is familiar with the fact that a piece of rusty iron, wrapped in cotton or linen cloth, soons destroys the texture of the fabric. A rusty nail, for example, if laid upon a few rags, will soon produce large holes in them, or it will, at least, render every point that it touches so rotten that the cloth will readily fall to pieces at these points, and holes will be produced by the slightest hard usage. Iron, during the process of rusting, tends to destroy any vegetable fibre with which it may be in contact. This explains, to a certain extent, the rapid destruction of the wood that surrounds the nails used in outdoor work, whereby the nail is soon left in a hole much larger than itself, and all power of adhesion is lost. Part of this effect is, no doubt, due to the action of water and air, which creep along the surface of the nail by capillary attraction and tend to produce rottenness in the wood as well as oxidation in the iron. But when we compare an old nail hole with a similar hole that has been exposed during an equal time, but filled with a wooden pin instead of an iron nail, we find that the wood surrounding the wooden pin has suffered least, and we may, therefore, fairly attribute a destructive action to the rusting of the iron. It might, at first sight, be supposed that, as the oxide of iron is more bulky than the pure iron, the hole would be filled more tightly and the nail help more firmly to its place. But, although this effect is produced in the first instance, yet the destruction of the woody fibre and the pulverization of the oxide soon overbalance it, and the nail becomes loose. Of course, the iron itself being also destroyed, its strength is diminished, and we have, therefore, a double incentive for preventing or diminishing the action that we have described. The only way to prevent this action is to cover the nail with some substance that will prevent oxidation. This might be done by tinning, as is common with carpet-tacks. Coating them with oil or tallow would be efficient if the act of driving did not remove the protecting matter entirely from a large portion of the surface. But, even then, it will be found that the oil or fat is stripped off the point, and gathered about the head in such a way to prevent the entrance of air and moisture into the hole. The most efficient way to coat nails with grease is to heat them to a point sufficient to cause the grease to smoke, and then pour the grease over them, stirring them about in a pot or other vessel. When the nails are hot, the melted grease will attach itself to them more firmly than it would have done if they were cold—indeed, so firmly that it will require actual abrasion of the metal to separate it. In erecting fences, laying plank or board sidewalks and the like, it becomes an important matter to secure the nails against the influence that we have mentioned, and yet the work must be done rapidly and cheaply. Nails may be readily prepared as described, or they may simply be dipped in oil or paint at the moment when they are driven in. In cases where it is not advisable to paint the whole fence, it is a good plan to touch the head of every nail with a brush dipped in oil or paint of the same colour as old wood.

THE THEORY AND PRACTICE OF MODERN HOUSE PAINTING.

By An Experienced Workman.

PREPARATORY PROCESSES.

BEFORE proceeding further we have a few words to say in reference to the manner in which the plastering of the walls and ceilings of our houses is done; and although not strictly speaking a part of the subject we are treating of, yet it is so intimately connected with it, and is in itself of so much importance, that we could scarcely pass it by without pointing out some of its shortcomings, but with very little hope of a remedy. No one having any experience in the decorations of dwelling rooms will have failed to notice the utter worthlessness of most of the plastering of our walls and ceilings; in fact, this is one of the many difficulties the decorator has to contend with, and is so common an experience that we have almost got to consider the evil as a matter of course and a necessary consequence of walls being plastered. We have invariably found that bad work is the rule and good work the exception. If we take ninety out of every hundred middle-class houses, we shall find that neither the walls nor ceilings are true, that the lines of the mouldings of the cornice are out of square, and the angles of walls out of plumb—in and out, to use a homely phrase, like a dog's hind leg; that the surfaces of the walls are uneven and full of hills and hollows, and if we place the edge of a long straight-edge upon the wall it stands upon the tops of the hills and leaves open spaces and valleys between, and here and there special protuberances, which neither add to its beauty or usefulness. If we examine the enrichments of the cornice, which are cast in lengths and require great care and nicety in fitting together and in keeping at one uniform level, we find in the majority of cases that they are badly joined, uneven, and vary very much in their projection, and thus look, and are, clumsy. When enriched ornament is correctly put up, the ornament should be so arranged that it will come in equally at each corner or angle. This is effected when the room has unequal sides by paring a little off each length or casting of ornament, and which paring is not perceived if properly done, or in some cases adding a little, as the case may be; but in many cases this necessary trouble is not taken, and the consequence is that we may not, and do not see, two corners alike in the same room. In other cases, we may see here and there in the length of the cornice of the side of a room a defect or break in the ornament in two or three places; yet the angles or corners will be all right. In these instances the plasterer has reduced one or two lengths of the ornament in order to make the corners come in right, instead of taking the trouble to reduce each length of casting and so conceal the means by which it is attained. In panelled ceilings, when much enriched ornament is used, these defects are very common. On the other hand, in first-class work the architect or his deputy designs the ornament and sees to getting out the working drawings for the modeller to work from, and looks well after the fixing of the castings in their place, and, as a matter of course, we thus get good work; but in the greater number of instances this is not the case, and the result is that we have, in addition to the evils enumerated above, a jumble and mixture of styles in the same room, and even in the same cornice. We may and do frequently see Gothic ornament in a Greek or Italian house; and in numerous cases the plasterer does not take the trouble to make new moulds or cast new ornaments for the work, but uses just what he may have by him or in stock, regardless of rule or propriety, and thus we get, perhaps, one moulding Greek, the next in the same cornice Gothic, the centre flowers of any known or unknown style, and so on *ad libitum*. Now this is a state of things greatly to be deplored, and one that calls loudly for a remedy. No doubt one cause is merely ignorance of the principles and laws of architectural ornament, and this will account for some of the blunders thus made; but the great cause of such discreditable work is not far to seek. We have abundance of good workmen, but prices are cut down to so low a figure that the contractor cannot do his work honestly and at the same time get a living profit out of it, therefore he causes the work to be done in a scamping manner. We also know by experience that the result is just such work as we have been describing—unsatisfactory and discreditable alike to all concerned. The difficulty of doing anything with it to put it right is one that all painters have to contend with, and it is quite certain that after all has been done that can be done with such walls they remain a standing reproach both to workman and employer.

In the preparation of walls for painting much care is required; in the first place, to clear off all protuberances or small projecting bits of mortar, &c. This may be effectually done either by rubbing the surface of the wall with a flat piece of wood, or with a large lump of pumice-stone. It may occasionally be necessary to use a flat piece of wood covered with sand or glass paper for that purpose. It is always best, and most economical, to make the wall as smooth as possible before commencing painting, as we thus save much after-labour when the wall is well rubbed down. We next proceed to stop or point up every hole, crevice, crack, or rough or uneven place, with plaster of Paris and a little finely-screened lime (technically called putty). In doing this care should be taken to stop and fill up the tops of the skirting-boards, round the architraves, and everywhere should be properly seen to, so that no place shall be missed. If this be done carefully at this stage it will save much trouble and time afterwards. When the plaster is dry, every place which has been stopped should now be rubbed level with fine sand-paper on a flat board (that is, a flat-sided piece of deal about about 4in. square and 1in. thick—the sand-paper should be folded over this, and rub with the flat side). This requires to be rubbed gently and softly, without much pressure. If much pressure is used the plaster will be broken and become rough, but if it is done properly, the stopping will be brought down to the level of the wall and will not be perceived when the wall is finished; but if carelessly done, every place which has been stopped will be clearly seen when the wall is finished, which is an ugly defect. Many painters leave the stopping until the wall has had one coat of paint, and then stop the holes with hard stopping—*i.e.*, white lead and whiting mixed together to the consistency of common putty. Some make it of dry white lead and japanners' gold size, or some quick varnish is used with the white lead. We prefer to use the first-named mixture, as it is not so liable to crumble or crack. We object to this practice when it can be avoided, as it is scarcely possible to point up the holes without leaving a projection, and still more difficult to rub it down to a level surface, except it is allowed to stand a long time to get thoroughly hard, and then it must be rubbed down with pumice-stone and water. Therefore, for producing an uniform level surface, the first plan is the best and the quickest, and, with new walls, safest. Many painters use glue size and whiting for this purpose, but this mixture is almost sure to crack and sometimes will crumble to powder, and its power of contraction is so great, if too much size is used, that it is sure to dry up and contract, thus leaving a crack all round the hole stopped. It may be as well here to state that the first process of pointing up the walls and rubbing down is equally applicable whether the walls are finished in oil or distemper colour. The walls being now stopped and rubbed down should be well dusted, and the room well brushed out, the floor washed, planks well cleaned, and every means should be taken to keep all dust and dirt down, as this is a fruitful cause of much rough work. Every care may be taken to mix and strain the paint and to have the brushes clean, and all be in vain, simply because the precautions above named have been neglected. For when there is much dust on the floor and on the planks which are being used, the moving about and friction of the shoes of the men upon them causes the dust to rise and settle on the walls and other work in progress, and on brushes and in the paint kettles. Thus, we create the very evil we wish to avoid. Precautions should also be taken before commencing painting to cover up the floors, so that they may not be spotted or daubed with paint. Drop cloths are used for this purpose, that is, sheets of common wrappering, or old sail cloth will do. They should be about 7ft. long and 3ft. wide. These may be laid all round the room, or the workman may carry one along with him and lay it just where he is working; but when so used and moved they are apt to carry dust with them, and except great care be taken will do more harm than good. But the best plan is to cover the whole of the floor with strong brown paper, firmly pasted down to the floor before the room is even commenced; two layers is, of course, better than one. This is an effectual preventive, both against paint spots and also in preventing the grit from injuring the floors. Men coming into the room with dirt upon their shoes accompanied with grit tread it into the wood and thus spoil the boards, which the above plan prevents. When the room is finished, or nearly so, the paper is easily removed by wetting with water, and the floor is preserved uninjured.

(*To be continued.*)

◆

VIEWS OF CHRIST CHURCH, CLAPTON.

THE subject of our illustrations this week is one of the designs submitted in competition for a new church at Clapton, Mr. James Brooks, 11, Serle-street, being the architect. The accomodation required was for 700 adults, at a cost not exceeding £5,000. Economy being the primary consideration, brick was chosen as the material to be used, except in the columns, caps, and bases; moulded bricks for jambs, arches, and strings. Nothing could be plainer or more simple than the treatment, yet nothing could be more impressive and dignfiied both in the interior and exterior of the building. The main body of the church consists of a broad nave and narrow aisles which are windowless. The whole light is obtained from large and lofty clerestory windows. The chancel is apsidal, having an ambulatory running round it and connecting the aisles. The interior has been so designed that at a future time decoration may be added in panels in the aisles, the stations, and in the roof; subjects from the life of Our Lord.

◆

ESSEX ARCHÆOLOGICAL SOCIETY.

THE eighteenth annual meeting of the Essex Archæological Society was held at Braintree on Tuesday week. Amongst the architects present were, Mr. Chancellor, F.S.A., and Mr. C. F. Hayward, F.S.A. Mr. T. Sutton Western occupied the chair. The annual report (read by the secretary, Mr. H. W. King) stated that since the last meeting, at St. Osyth, twenty-seven new members have been elected, and four were to be proposed for election at the meeting, making in all the largest accession the society has received for many years. Seven members have been lost to the society by death or resignation since the last meeting. A new illustrated catalogue of antiquities, partly the property of the Corporation of Colchester, partly of the society, and partly lent by the several owners of the exhibition, has been recently issued to members. The first part of volume V. of the Journal of the Society's "Transactions" is nearly completed. The report concludes by expressing an opinion that if but twenty new members are enrolled annually the vitality of the society will increase and its usefulness will be greatly extended. The report having been adopted,

The Rev. B. Lodge, Rector of St. Mary Magdalene, Colchester, read a paper "On a Roman Sepulchral Monument found at Colchester." It is the figure of a Roman centurion in full armour, carved in bold relief, more than half the natural height and dimensions, *i.e.*, 3ft. 7in. The exact height of the canopy under which it stands, including base, is 6ft., and the width 2ft. 4in. The figure has been fractured just above the feet, one of which is slightly imperfect, the remainder being in excellent preservation. The inscription was as follows :—

M· FAVON· M· F· POL· FACI
LIS· ▷ : LEG· XX· VERECVND
VS· ET· NOVICIVS· LIB-POSV
ERVNT· H· S· E·

The interpretation of this is stated to be—Marcus Favonius Marci Filius Pollia Facilis. > (Centurio) Legionis XX. (Vicesimæ). Verecundus et Novicius Liberti Posuerunt—Hic Situs Est.

The Rev. E. J. Hill, Rector of Panfield, and Rural Dean, then read a paper entitled "A few Brief Notes of Objects of Interest in the neighbourhood of Braintree." Speaking generally of the neighbourhood, he said that to the archæologist Braintree and its neighbourhood is comparatively unbroken ground. It is not rich in ecclesiastical edifices, in consequence of the dearth of stone, so that we find generally rubble work of coarse flints ; a soft stone called "clunch" being used for windows and internal decorations, and a hard stone called "barnack" for buttresses, labels, and quoins. There is also much brick-work, some towers of late date being of that material, as at Rayne. In domestic architecture, interesting specimens abound of old halls and manor-houses, mostly of brick, with Tudor windows of clunch, and handsomely clustered chimneys, and here and there internally some good wood-work. In passing through Bocking and the villages of the district we meet with picturesque timber dwellings, many of the sixteenth century in date, with projecting gables, oak barge-boards, and plaster pargetting. Two in Bocking bear their dates, one 1595, and the other a few years later. In Gosfield there is an elegant specimen of a single-fluted chimney ; and in Wethersfield are many examples with a variety of detail. Leaving generalities, and coming to the subject-matter of his paper, Mr. Hill first described at great length the ancient parish church of Great Raines, dedicated to S. Michael and All Angels, *circa* 1349, after which he proceeded to give brief descriptions of the Church of All Saints, Rayne Parva (Early English, with modern nave and chancel) ; the restored church of S. James, Saling Magna ; Saling Parva, with its circular tower of flint and Early Second Pointed windows in the upper stage ; Holy Trinity, Great Bardfield ; S. Catherine, Little Bardfield, with its Norman towers ; S. John the Baptist, Finchingfield ; SS. Peter and Paul, Black Notley ; the Church of the Blessed Virgin, Panfield ; S. Mary, Bocking ; S. Andrew, Shalford ; S. Mary Magdalene, Wethersfield, and Shalford Hall. After a paper by the secretary "On the ancestry of Sir Denner Strutt, Bart., the Cavalier," the party partook of luncheon, and afterwards visited many of the places named in Mr. Hill's paper ; and this excursion over, the proceedings were brought to a close.

◆

BOOKS RECEIVED.

THE fourth edition of Sir William Fairbairn's work *On the application of Wrought and Cast Iron to Building Purposes* (London : Longmans, Green, and Co.) will be welcomed by all interested in the changes which have occurred since the appearance of the last edition in 1864. A considerable amount of new matter is added, thus making the book in a greater degree than heretofore a reliable and standard authority on the subjects on which it treats.—*Pewtner's Comprehensive Specifier*, edited by William Young (London : Longmans), is a sort of handy-book intended as a work of reference for the young architect and builder, from which may be extracted the various items of a specification with considerable saving of time.—*A Handy Book of the New Law of Bankruptcy*, by William A. Oliver (London, Simpkin, Marshall, and Co.), appears to be a careful and reliable guide to the New Bankruptcy Law, and should be consulted by all interested in the changes in commercial relations consequent on the working of the Act.—*The Report of the Streets' Committee of the City of London Commissioners of Sewers on the Val De Travers Compressed Asphalte Carriage-way Pavement*, by William Haywood, M.I.C.E., F.R.I.B.A., contains an amount of information valuable to those who are now following out the solution of the problem as to the advantage or otherwise of substituting asphalte for granite as a road material. Mr. Haywood's conclusions are that the asphalte pavements, while convenient and capable of being kept clean and safe for traffic in all weathers, will prove more expensive than granite pavements (though not more expensive than macadamized roads), and that it is desirable to give the material a more extended trial before finally deciding on its merits. The Streets' Committee recommend that the whole of the Poultry and Cheapside be forthwith paved by the Val de Travers Company with their asphalte, that this trial may be fairly made.—*The Disposal of Town Sewage*, by R. W. Peregrine Birch, C.E. (London : E. and F. N. Spon), is a paper read before a supplemental meeting of the students of the Institution of Civil Engineers, and to which a Miller prize was awarded. Some well authenticated particulars of some of the principal schemes for sewage utilization at present carried out or in progress are given, together with a few notes upon the true theory of filtration and the self-purifying tendency of polluted streams.

◆

ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETIES.

Birmingham and Midland Institute.—Archæological Section.—The last excursion for the present year took place on Wednesday last, when the members of the section visited Baginton, Stoneleigh, and Kenilworth. On the way to Stoneleigh Abbey, the journey was broken at Baginton, in order to pay a visit to the parish church, which is of thirteenth century date, and is chiefly noticeable from having three narrow arches in place of the usual chancel arch. On reaching Stoneleigh, the almshouses, Motslow-hill, on which the tenants of King Henry II., in that manor, were compelled every three weeks to do suit to the Manor Court which was held here, and the parish church, were visited. In the church there are some good examples of Norman work, the enriched chancel arch, and the fine font removed some years ago from Maxtoke, being well worthy of examination. There are several monuments and effigies in the church and mortuary chapel of the Leigh family, to which the attention of the visitors was directed. The members of the section then proceeded to Stoneleigh Abbey. The visitors after luncheon drove to Kenilworth Castle, where the Rev. E. K. Knowles described the ruins and explained the works in progress for clearing and preserving them. Dinner was provided at the King's Arms Hotel at five o'clock, after which a visit was made to the parish church, where an opportunity was found of studying more rich Norman work, and to the adjacent ruins of the Priory, where there is a picturesque gateway of the fourteenth century.

Somersetshire Archæological and Natural History Society.—As has been previously announced in the Building News, the twenty-second annual meeting of this society is appointed to be held at Wincanton on Tuesday, August 23rd, and two following days, under the presidency of Sir W. C. Medlycott, Bart. On the first day the president's address will be delivered, the business transacted, papers of local interest read, and a visit paid to the church. On Wednesday there will be an excursion to North Cadbury, Cadbury Camp, Compton Church, and Mapperton ; and on Thursday to Temple Combe, Stowell Milbourne, Wick Encampment, Milborne Port, and Hentsridge. A local museum will be opened under the management of the curator, Mr. Bidgood.

St. Alban's Architectural and Archæological Society.—This society held a meeting on the 20th ult., when papers were read as follows :—"On Bell Inscriptions," by Mr. Ridgway Lloyd ; "On Sandridge Church," by the Rev. O. W. Davys ; and "On Antiquities in and near East Herts," by Mr. Pollard.

Wiltshire Archæological and Natural History Society.—The annual meeting of this society has been fixed for September 14th, 15th, and 16th, at Wilton, under the presidency of Mr. Charles Penruddocke, of Compton. It is in contemplation to visit Wilton House, Wardour Castle, Fonthill Abbey and House, Compton Park, and Longford Castle, as well as to pay a lengthened visit to the Blackmore Museum at Salisbury. Messrs. Swayne, Nightingale, and Stevens are the hon. secs. for the meeting.

The third general meeting of the Architectural and Archæological Society of Durham and Northumberland was held on Tuesday last at Aycliffe, Heighington, and Walworth Castle.

◆

PARLIAMENTARY NOTES.

New Law Courts.—Mr. G. Gregory, on Thursday last, moved that in the opinion of this House the building of the New Law Courts should be proceeded with without further delay. He was happy to find that the First Commissioner of Works cordially agreed with the object he had in view in putting that motion on the paper, and therefore it would not be necessary for him to inflict upon the House a speech in support of his motion.—Mr. Alderman Lawrence objected to the course taken by the Government with respect to the plans. They had not laid down on their block plans any approaches to what he might call a large new law market. He thought that approaches to the market were an integral portion of the plan, and ought to be laid out and provided by the Government.—Mr. Ayrton said that the estimate for the preliminary works would be laid on the table on Friday ; therefore it was not desirable to anticipate a discussion which was sure to arise when the votes on the subject came under the consideration of the House. The question raised by Mr. Alderman Lawrence was foreign to the legislation that had already taken place, but his hon. friend and his constituents might set a good example by taking measures to remove the structure which public opinion did not sanction either on account of its beauty or antiquity, and which was a serious obstruction between Fleet-street and the Strand.

Southwark Park.—Mr. Locke called the attention of the House to the intended appropriation of a large portion of Southwark Park for building purposes by the Metropolitan Board of Works ; and moved, "That in the opinion of this House the whole of the land purchased under the Act of 1864 (the Southwark Park Act) should be preserved as a park for the use and recreation of the public." Mr. Secretary Bruce supposed that scarcely any hon. member would consider even 163 acres too much for the recreation of the population on the south side of the river. But that was not the question before the House. The Metropolitan Board of Works, being a representative body, chosen by the ratepayers, were entrusted by Parliament with the purchase of land for the park at Southwark, and by the Act which conferred that power upon them permission was given to set aside some portion of the land which they bought for building purposes. It would be admitted that this was a judicious course when it was considered how the making of the park would increase the value of the adjoining land ; and the Board, having purchased more land than was ever proposed to be appropriated to the park, were now able to recoup the ratepayers by setting it aside for building. By setting aside sixteen acres they hoped to return the ratepayers something like £36,000, but, apart from the question whether they had done their duty in the matter, it would be beneath the dignity of the House to pass a resolution calling on the Metropolitan Board of Works not to execute the powers conferred upon them by an Act of Parliament. If the hon. member disapproved of the course they were taking he had better move to repeal the Act of Parliament, or, if he thought they were exceeding their powers, the remedy was to be found in an application to the Court of Chancery. Probably, however, the present motion would have the effect of inducing the Metropolitan Board to reconsider their decision, and he, for one, should be glad if the result were to induce them to set aside a larger portion of the land than was proposed for the recreation of the people.—Mr. Locke then withdrew his resolution, and gave notice that next session he should ask leave to bring in a bill to restrain the Metropolitan Board from diminishing the area of Southwark Park.

The New Courts of Justice.—On Tuesday, on the vote of £21,450 to defray the cost of the purchase of the site of the New Law Courts, after some observations from Mr. Sclater-Booth, Mr. Stansfeld, and others, Mr. Ayrton said that this vote arose out of an Act of Parliament passed five years ago, by which the sum of £1,500,000 had been appropriated for the erection of the Palace of Justice, and for the purchase of land on the north side of the Strand in connection therewith. The whole subject was referred to a Royal Commission instead of being entrusted to the Treasury, and the consequence was that the expenditure had been increased to £3,250,000. In this state of things the Chancellor of the Exchequer recommended him to put himself in communication with the parties. The value of the land had been increased from £750,000 to £800,000, but the character of the building was considerably altered, and it was arranged that the block of buildings for the courts of justice should be so constructed as to make it applicable to the various courts and buildings necessary to carry on the actual business of the courts of justice. The commissioners acceded to the altered plan, and the building would be erected in accordance with this altered plan. The present estimate had only reference to the clearing of the ground and to laying the foundation of the building. This was all that could be done previous to the estimates coming before the house next year.—Mr. G. Gregory said that the plans laid before the Royal Commission were so wide that they were justified in the course they had come to in the first instance; but they entirely agreed with the altered plan which had been submitted to them. He believed the new plan would give all the accommodation that was necessary to carry out the administration of justice.—Mr. Whitwell said he supposed the estimates included the approaches to the new courts of justice.—Mr. Alderman Lawrence said that the new block of buildings was different from that which had been previously laid before the House. It was of great importance that public buildings, on which large sums of money were expended, should not only be useful for the purposes for which they were intended, but that they should have some pretensions to architectural beauty, and also that they should have proper approaches. In the present case the ground about the building was not to be utilised in a proper manner. It was not intended, apparently, to widen the Strand at that point, nor to set the building back from the Strand and from Carey-street. If Parliament did not provide for the creation of proper thoroughfares in this part of London they might be sure the legal interest would not do it. They would not allow a street to pass through Lincoln's Inn, and it might happen that Carey-street would be the only great thoroughfare leading from Chancery-lane westward. It was the great fault of most public buildings in the metropolis that their frontage was brought fully up to the line of the pavement, so that they had no approaches. That was seen in the London University buildings in Burlington-gardens. If it were arranged that the building should be sufficiently set back on the Strand side, there would be no indisposition to widen Fleet-street at Temple Bar, so as to admit of the passing of four vehicles abreast. He did not pretend to criticise the details of the plan, so far as related to the wants of the profession, but he felt perfectly competent to criticise the traffic arrangements of the plan, and they appeared to call for it. Every attention was paid to the wants of the profession in the building, and as he believed it would cost, before it was completed, two millions sterling, he warned the House that it would not be doing its duty if it did not see that proper approaches were provideded for the building. Mr. Beresford Hope was understood to give the plan his hearty approval, and after some further discussion the vote was agreed to.

Sundry Votes.—The following votes were then agreed to, to complete the amounts required:—£44,000 for acquisition of land for the New Palace of Westminster, and £13,000 for the erection of new houses in Downing-street for the Foreign, Colonial, and Poor-law Departments. £37,250, site for the enlargement of the National Gallery (Mr. Barry to be the architect, provided that he subscribes to the condition of his appointment). £44,000 for new buildings for the Departments of Science and Art. The vote of £644 for the Wellington Testimonial was withdrawn until the correspondence on the subject was produced. The next vote was a sum of £7,000 for erecting and maintaining certain new buildings in connection with the Post Office. Mr. Ayrton explained that the cost was owing to the arrangements recently made to carry on new telegraphic arrangements. A sum of £28,500 was then proposed for maintaining the harbour and breakwater of Alderney. A large sum of money had been already expended on this public work, and on a report made by Mr. Hawkshaw, an eminent engineer, the Government decided to carry out his recommendation so far as to continue the work, and Mr. Ayrton hoped the committee would agree to the vote. Colonel Sykes wished to know of what use was this harbour at Alderney, on which £1,300,000 had been already spent. Mr. White thought it would be far better to throw the island into the sea than to be expending the public money in this way. The vote was agreed to.

The British Museum —The next vote was one of £6,000 for the natural history collections of the British Museum. The Chancellor of the Exchequer explained that nine years ago these collections were so extensive that the greatest inconvenience arose in their exhibition, and M. Panizzi proposed that provision should be made for the erection of new buildings to receive these collections. The evil, which was considerable then, was worse now. After a careful examination of the subject by persons skilled in such matters, it had been determined that what was known as the "typical" mode of exhibitions was that which ought to be adopted in this case. A site on the embankment had been proposed, but that would not only be costly but it would be subject to conditions unfavourable to the object. Another plan had been the enlargement of the museum itself; but that too had been abandoned. They were thus led to look to the western suburbs as the most likely to aid them in the carrying out this work. It happened, fortunately, that the Commissioners of the Exhibition of 1851 had sold to the Government a plot of 16 acres of land, at Brompton, for £7,000 an acre, which was admirably adapted for the purpose. It looked upon the Cromwell and Exhibition-roads, in the vicinity of the South Kensington Museum, and the total cost of acquiring the site had only been £120,000, which he had been informed was less than its present value by £100,000. The outside estimated cost was £350,000, and as £400,000, and even £600,000, had been asked for the same work, it could not be deemed excessive. Those were the views he had to place before the committee, and he hoped the committee would accept them.—Mr. B. Hope remarked that the plan did not remove the old objection of separation from the museum, the library, the staff, and the antiquities, which had always been deemed one of serious consequence.—Mr. White characterised the present proposition as a gross Brompton job, and should give it every opposition in his power. It was entirely against the wishes of the trustees and every scientific man in London.—Mr. G. Booth denied that the scientific men of London were opposed to the separation, for when he was in office he received many applications in accordance with the vote now proposed.—Mr. Dillwyn believed the proposed movement was only the commencement of removing the British Museum altogether from its present locality.—Mr. Bentinck believed the great portion of the specimens of the natural history collection at the Museum were utterly useless. He wished, therefore, to know in what condition they were. The Chancellor of the Exchequer replied that all that was visible would be removed to Kensington. The Committee divided, and the vote was agreed to by a majority of 62.

Building Intelligence.

CHURCHES AND CHAPELS.

Arksey.—The parish church of All Saints, Arksey, Doncaster, was re-opened on Friday last by the Archbishop of York, after restoration at the hands of Mr. George Gilbert Scott, R.A. The first contract was for the restoration of the east end—the chancel, side chapels, and transepts. In taking out the modern east window the workmen discovered the original window, the jambs, which were beautifully decorated with painted scroll work, being quite perfect. Various other interesting discoveries were made. Under the floor and over the transepts was found what was considered to be the old altar table. It was about 4ft. long, but had evidently been broken. It has been lengthened to 7t., and is now placed on a strong oak frame table designed by Mr. Scott. The chancel has been paved with Minton's tiles and furnished with a new oak roof, and the roofs of side aisles and transepts have been repaired. The new seats in the side chapels and transepts are of red Petersburgh and pitch pine, stained and varnished, the chancel being provided with two rows of oak seats for the choir, and an oak lectern. The second contract was for the restoration of the nave, side aisles, and porch. The north aisle was the first commenced, and at the first it was found necessary to foot and concrete all the foundations to the level of the ground. The north door, which has been walled up for some years, has been re-opened and restored to its original character, and some of the buttresses of the aisle were taken down and rebuilt. A new traceried window has been filled in at the west end, and all the windows in the south aisle supplied with new tracery. The aisle roof has been repaired and re-covered with lead, and the nave provided with a new high-pitched roof of oak. Messrs. Anelay have executed the works, Mr. Stenton being their foreman. The entire cost will be about £3,000.

Bolton —The groined ceiling of the chancel of the new parish church of Bolton is now being decorated by Messrs. Clayton and Bell, of London. The whole of the elaborately-carved bosses are in gold; the ribs are also edged with gold, relieved by chevron ornaments, while in each panel, upon a groundwork of vellum, is the figure of a musician. Bands of colours, with the sacred monogram, also form a feature of the work, which is expected to be completed in about a fortnight.

Bowling.—On Saturday afternoon the memorial-stone was laid of a new Wesleyan Chapel at Prospect, Bowling, near Bradford. The building is being erected in the Italian style, from the designs of Messrs. Andrews, Son, and Pepper. Internally the building is 78ft. long by 49ft. wide, and the height of the ceiling from the floor is 30ft. In the basement are a school-room to accommodate 450 children, and four good-sized class rooms. A vestry, 25ft. long by 11ft. wide, is placed at the back of the chapel, and there is also a minister's vestry. Sittings will be provided for 768 persons.

Bury S. Edmunds.—A new font has just been presented to S. James's Church, Bury, by Mr. A. Bevan. The octagonal shaft of the old font, of Ketton stone, has been freed from its numerous coatings of paint, and is now restored to its former use as the shaft of the new one. Around it, at each of its angles, is a slender column of Purbeck marble, with stone base and foliated capital. On these rest the basin of Caen stone. The panels in the eight faces of the octagon are elegantly moulded, the principal mouldings being relieved with pateræ. Four of the panels are deeply recessed, and contain groups of sculpture relating to the baptismal rite, the four intermediate panels containing emblematical devices. The basin is lined with lead, and has an oaken cover, some excellent scroll work in hammered iron radiating from the handle by which it is lifted. The font is reached by two stone steps. The basin of the old font is buried beneath the new one, and the water from the latter will flow through the former as it passes away. The font has been executed by Messrs. Farmer and Brindley, of Westminster-road, London, from a design by Mr. G. G. Scott, R.A.

Dunstable.—On Thursday, the 21st ult., the Priory Church of Dunstable was re-opened, after being closed for a long time for purposes of restoration. Much remains to be done, however, and £4,000 is required. It is suggested that collections should be made throughout Bedfordshire in aid of the object.

Exeter Cathedral.—The Dean and Chapter of Exeter have finally adopted the amended plans of Mr. G. G. Scott for the restoration of the Cathedral, but have postponed the order for the execution of the work until they have ascertained the result of their appeal to the diocese for funds The amount required for the first part of the work is £15,000, of which £12,000 has been raised.

Great Ashfield.—The parish church of Great Ashfield, near Elmswell, Suffolk, was re-opened on the 19th ult, after restoration. The edifice, which is dedicated to All Saints, consists of nave and chancel, north aisle, south porch, and a square tower of flintwork, and is a well-proportioned, lofty, and spacious edifice, without galleries. The chancel has been almost entirely rebuilt, and covered in with a new roof of pine, and the east window has been filled with stained glass. The south wall of the nave, which had departed considerably from the perpendicular, has been entirely rebuilt from the chancel arch to the south porch. This part of the church contains some very good windows of the Perpendicular period. The whole of the interior stonework has been cleansed of its many coats of whitewash, and many of the windows have been newly glazed. The church is unusually rich in ancient benches, about a dozen of which have survived the indifference and neglect of bygone churchwardens. The organ, which has hitherto blocked up the entrance to the tower, now stands in the south-west angle of the nave, and the tower is thus thrown open to the church—a handsome Decorated window, of bold tracery, being disclosed to view. The works have been carried out by Mr. Simpson, of Stowmarket, under the direction of Mr. Jackaman, architect, Bury.

ISLINGTON.—A subscription is being raised for completing the exterior of the Roman Catholic Church of S. John the Evangelist, Islington, according to the original design of the architect, the late Mr. Scoles. This design includes the erection of two towers (to be called respectively S. Michael's and S. Peter's towers) surmounted by spires at the two extremities of the present front of the church. The towers were partially raised when the church was erected, so they will only require to be still further raised. The cost is estimated at £1,100, of which sum £400 is already promised.

KENSINGTON (Liverpool). — Christ Church, Kensington, on the high road to Fairfield, was consecrated by the Bishop of Chester on the 21st ult. The church, which is Romanesque in style, consists of nave, 94ft. long, 24ft. wide, and 57ft. high from floor to apex of roof, with aisles on either side 13ft. 9in. wide by 90ft. long; choir and chancel, 32ft. 3in. long; north transept, 19ft. by 18ft.; the south transept being occupied as an organ chamber and vestry. The nave is in five bays, the arches springing from piers of polished red granite, with Bath stone bases, heads, and capitals. The reredos is of Caen stone, and consists of a series of ten arches resting on small columns of green Irish marble. The roof of the church is open-timbered, and the whole of the church furniture, with the exception of the lectern, sedilia, and communion table (which are of oak), is of polished pitch pine, the seats being open. The altar floor, chancel, and wall round the font have been laid with encaustic tiles by Mr. Oppenheim, of Manchester. The hot-water apparatus is by Mr. Seward, of Lancaster, while the gas-fittings and all the ornamental ironwork of the church have been furnished by Messrs. Smith and Sons, of Birmingham. Externally the church is built of ordinary grey brick, with Stourton stone bands and red and black bricks in bands and arches. There is a tower and spire 150ft. high at the west end. Messrs. W. and G. Audsley, of Harrington-street, Liverpool, are the architects, the contractor being Mr. E. Hughes, of Miller's Bridge. The cost, including site, will be about £10,000.

LEEK.—On Saturday week the corner stone of a new building, to be used as a Wesleyan Chapel and Ragged School, in Mill-street, Leek, were laid at Leek. The building will be of plain Early English character, in red brick, with stone dressings, two stories in height, the lower story for school purposes and the upper for the chapel, in which 400 persons can be accommodated, the latter with a gallery at one end and class-rooms under. The cost will be £800. Mr. Sugden is the architect, and Messrs. Knowles and Tatton are the contractors.

LEWISHAM.—The new church of S. Mark, at Lewisham, was consecrated on the 20th ult., by the Lord Bishop of Rochester. A sermon was preached by the Lord Bishop of Victoria upon the occasion. A luncheon was afterwards provided, at which the Right Hon. the Earl of Dartmouth presided. A notice of the building appeared in our columns upon the occasion of the laying of the foundation stone in May last year. The building has been erected by Messrs. Carter and Sons, of Holloway, from the designs and under the supervision of Mr. William C. Banks, of 39A Gracechurch-street, London. The carving has been well executed throughout by Messrs. Mc Carthy and Smith, of Belvedere-road. The pulpit, the gift of a lady, and the font, the gift of the architect, are of elaborate design, with appropriate subjects carved thereon. The cost of the works to the present time, leaving out the upper part of tower and spire and the boundry walls, is about £7,100, the original contract being £7,050. A splendid organ, by Willis, of Camden Town, has been erected at a cost of £550. The lighting and ironwork were done by Messrs. Richardson Slade and Co., and the tile paving by Messrs. Hawes.

MENSTON.--The foundation stone of a new church, dedicated to S. John the Divine, was laid on Saturday afternoon. The building will seat 120 persons, and is estimated to cost about £1,000. The style, which is from designs by Messrs. Price and Linklater, architects, Manchester, is Early Gothic. It will be built of stone throughout. The contractor for the masonry is Mr. Lapish, of Hawkesworth; and for wood-work, Messrs. Longley Brothers, Leeds.

NORWOOD.—On Wednesday week the first stone of a new Roman Catholic Church was laid by the Right Rev. Dr. Morris, Bishop of Troy. The new church will be situated at right angles to the north-east end of the present convent, and will be from designs by Messrs. Goldie and Child, of Kensington-square, and is to be dedicated to the "Faithful Virgin." When completed it will consist of a nave 35ft. wide by 96ft. long, which will be occupied by the choir stalls of the nuns, and give accommodation for nearly 300 destitute orphans, who are maintained and educated under the care of the nuns attached to the establishment. Beyond the nave will extend a chancel and sanctuary of apsidal form, 41ft. 9in. long, making a total length of 138ft. The transept will be 25ft. wide and 38ft. long, and at a future period a second transept on the opposite side will be added, thus completing the cruciform plan of the church. It is intended at present only to build the nave and sanctuary, and to complete the designs as funds are obtained. The style of the building will be Geometrical Gothic, simply and broadly treated. The materials are stock bricks, with dressings of Bath stone and Portland, the latter being occasionally used internally. Messrs. Jackson and Shaw are the contractors.

THE JEWISH CEMETERY AT DOVER.—On Friday last the memorial stone of what is known in Hebrew phraseology as a "cemetery lodge" was laid at Dover. The building is made to answer the same purpose as a cemetery chapel in Christian places of interment. The building is being erected by Messrs. Tunbridge and Denne, from plans furnished by the borough surveyor, Mr. John Hanvey.

WALTHAMSTOW.—The memorial stone of a new Congregational Church was laid at Walthamstow on the 27th ult. The new building will be erected on the piece of freehold land on which the old meeting-house stood, a site hallowed by association with Dr. Watts and Dr. Dodridge, who often preached there. The estimated cost, exclusive of architects' commission and other extras, is £4,184 11s. The chapel is to accommodate 700 persons, and is in the Decorated Gothic style. Messrs. J. Tarring & Son are the architects, and Mr. W. Henshaw the builder.

WEM.—The memorial stone of a new Baptist Chapel has been laid at Wem. The material with which the building is being erected is local pressed brick, with dressings of Grinshill stone. The interior of the edifice will be finished with an open timber roof, ceiled under the spars, and is designed to have good acoustic properties. The contractors are Mr. T. Francis and Mr. H. Tommy, Wem, and the structure is being erected from the design of Mr. David Walker, architect, of Liverpool and London.

WINCHESTER.—The committee for building the proposed new church near the railway station has resolved to proceed with the building from a design furnished by Mr. Colson.

WORMINGFORD.—The church of S. Andrew, Wormingford, has just been reopened, after having undergone a thorough restoration at a cost of nearly £2,000. New open timber roofs have been erected over the nave and chancel, and the west end, previously blocked up with an old gallery and the organ, has been opened out, the organ being removed to the north side of the chancel. The whole of the nave and north aisle has been re-benched in solid oak, and the windows throughout (except three in the chancel, which have been filled with stained glass) are glazed with cathedral glass. The church is paved throughout in Maw's tiles. Messrs. Catchpool and Thompson, of Colchester, supplied the heating apparatus. Externally the roofs are covered with plain tiles. The old plastering has been stripped off the north and south walls, and the rubble work repaired. The tower has also been stripped in a similar manner, bringing to light a flint face in very good condition. The buttresses are new, and the internal walls have been re-stuccoed. A vestry has been added on the north side, and a new porch on the south side. Mr. Fred. Chancellor, of Ipswich, is the architect, Mr. Joseph Grimes, of Colchester, being the contractor.

BUILDINGS.

BRIGHTON.—Markwell's Royal Hotel, Brighton, was inaugurated on Saturday week. The building stands boldly out from the King's-road, and has been erected on the site of the old battery, or what was more recently Mahomed's Baths. The hotel covers an area of only about 1,500 square feet, but as it has three frontages, great opportunity was given for subdivision of rooms. The building is five stories high, and has a Mansard roof, pierced by dormer windows. Mr. Whichcord is the architect, Mr. James Winterbourn being the builder.

WESTHOUGHTON. — The *Bolton Chronicle* remarks on the rapid extension of building in Westhoughton of late years. That extension still continues, and at the present time a large number of dwelling-houses are in course of erection in Chapel-lane and other thoroughfares, to say nothing of the new parish church, Wesleyan chapel, Congregational schools, and the Town's Offices. It seems a pity, however (says our contemporary) that there is no authority in this township whose business it is to see that new streets are properly laid out.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

RECEIVED.—J. P. S., G. H. G., J. C. J., T. C. E., H. W., G. O., W. H. R., J. D. M., J. B., T. T. and Co., W. S., F. E. T., T. P. L., J. A., J. S., L. and H., J. H., J. F., J. C., W. S. B.

S. R.—Your sketch of doorway of K. Church is not good enough for reproduction by the photo-litho process. We have received several others recently of similar quality.

EDWARD HODGSON.—With sketch of St. Peter's Church.

THEODORE.—Tyler, 7, Wood-street, Westminster.

J. B. MARSH.—With sketch of west door of St. Peter's, Wolverhampton.

ERRATUM.—In our notice last week of the new Baptist chapel, James's Grove, Peckham, Mr. J. Mitchell, of Bedford-row, should have been named as the architect, and Mr. J. Thompson, of Camberwell-green, as the builder.

Correspondence.

BUILDERS' CONTRACTS.

(*To the Editor of* THE BUILDING NEWS)

SIR,—Within the present month an ambitious contemporary, aiming to represent the higher and artistic branches of our profession, published—with the prominence of a leader—an article of importance to the profession generally, but especially to those gentlemen who may chance not to be able to write after their names the mystic initials "F.R.I.B.A." It was based on the consideration of a complaint by some of the most eminent London builders that the usual terms of a building contract gave to the architect certain powers, unobjectionable if placed in the hands of practitioners of acknowledged reputation, but not so as regards those of inferior position.

The part of the general conditions particularly brought under notice was an arbitration clause, and if this could be conceded the builders seemed disposed to rest and be thankful. The matter was considered by the Institute, and that illustrious body having "loyally determined" to concede the principle in a certain form, I would invite your attention to the nature of such concession.

The representatives of the Institute propose that the valuation of extra works and the liability for delay in the performance of the contract should be left for a referee to decide upon, but "the control of the building, the interpretation of the drawings and specifications, and the approval of materials and workmanship are considered to be of the essence of the architect's functions, which he cannot be invited to yield in any way to any superior jurisdiction but that of the courts of law;" and the "authorities of the profession" also propose to "confine the selection of the arbitrator to the body of Fellows of the Institute—these being practising architects of not less than seven years' standing."

Now, the "authorities of the profession" here alluded to are probably all Fellows, and it has no doubt escaped them that the adoption of this suggestion would necessarily hand over entirely to themselves all the judicial work hitherto also enjoyed by gentlemen who are perhaps merely Associates, or, may be, not connected with the Institute at all. It is well known that among the most important referees of the day are gentlemen who are not Fellows of the Institute. And why is this? Because the fact of a man being a Fellow has, in most cases, necessarily prevented him from taking part in the earlier years of his practice in those technical and practical matters upon which, in the majority of cases, he would be required to decide. And if the Fellows of the Institute are determined to enlarge the sphere of their action so as to take in that now to a great extent performed by surveyors, very many will soon discover that it will be necessary to acquaint themselves with matters which at the present time they are proud to look upon with disdain and contempt.

There would seem to have grown up recently a strong feeling on the part of the architect pure and simple of seven years' standing that by the very fact of his utter ignorance of practical details and judicial functions, from which it is his pride and ambition to hold himself aloof, he becomes a superior and inspired creature, who can not only afford to look with scorn on the laborious existence of his more practical and well-informed brethren, but now proposes to add to the extensive range of his artistic acquirements the whole business of deciding upon building disputes, which in almost every instance turn on a right appreciation of technical points with the true nature of which it is ever his boast that he is unacquainted.

The mere suggestion by the Council of the Institute that the duties of arbitrator should thus be confided to persons qualified by seven years' practice as architects, and payment of four guineas a-year, deserves serious consideration by the builders to whom the proposal will be made, and of all surveyors and architects who may not enjoy the qualification just mentioned; and I hope that the subject, which is of vital importance to the interests of the profession, will receive the fullest discussion in the pages of your journal.—I am, Sir, &c.,

A Surveyor.

NEWARK CHURCH COMPETITION.—EXTRAORDINARY ARBITRATION BY MR. SCOTT.

Sir,—It is very common for architects to find fault with competition committees, but the eminent architects who are sometimes appointed to arbitrate frequently act with as little logic, and consequently with as little fairness, as their employers. The Newark Church competition is a case in point. Mr. Gilbert Scott was appointed the arbitrator. Eight architects, residing in Nottinghamshire and Lincolnshire, were invited to compete. Two designs, respectively from Mr. Knight and Mr. Evans, of Nottingham, were pronounced by Mr. Scott to be equal in merit and superior to those of the other competitors. The design from Mr. Evans was drawn in the somewhat hackneyed style so much liked by Mr. Scott. Of course as Mr. Scott could only judge by his own lights, no blame can be attached if he made a mistake. But why, after distinctly stating that the designs are equal in merit, does he in his report proceed to criticise one design and not the other? If one design possesses faults so must the other; otherwise how can they be equal in merit? The fault which he finds in Mr. Knight's design is that his chancel is too small, so that he throws in a criticism against Mr. Knight's design as a sort of spoke in the wheel for the other design; and this (as previously mentioned) after clearly stating that the two designs are equal. But now for the justice of his criticism. The cost of the church is to be £3,000, and it is to accommodate 600 persons. Mr. Knight's chancel is shown to be 32ft. long by 19ft. broad, inside measure. I think I may safely leave it to the practical common sense of your readers whether—considering the small amount (£3,000) provided, and the large comparative accommodation—this chancel would not be ample for the purpose. That there are faults in Mr. Evans's design is manitest enough, but I forbear to criticise them, although I am sure all will understand how extremely unfair and invidious it was, after yielding an apparently unwilling admission that the designs were equal, to proceed to criticise one and not the other; more especially as Mr. Scott's criticism would not fail to be pronounced by all practical men as being incorrect under the circumstances.

After so little consideration has been shown by the arbitrator, it is not a matter for surprise that the committee should show still less In the first place, they have opened the letters containing the mottoes before the competition was decided; and, as an illustration of the great unfairness of this measure, it is only necessary to mention that whereas one competitor was well known to the committe the other had not the least acquaintance with a single member. They disregarded the clause in the conditions which states that a London architect should decide the competition (which had been left an open question by Mr. Scott); and they have acted upon their arbitrator's remark about the size of Mr. Knight's chancel, which every practical man must know is, under all the circumstances of cost and accommodation, amply large enough, and they have accepted Mr. Evans's design.—I am, Sir, &c.,

A Sufferer.

BUILDERS DRAWING PLANS.

Sir,—There is, perhaps, too much of that cry for "protection" (so natural to every one of every occupation) in the several letters that have been published on this subject to make their assertions of much value. The protection for architects, so much desired by some, would appear, from many remarks of those who advocate the subject, to be a monopoly of doing certain things that others could do as well or better—the privilege of a trade, instead of the noble patriotism that fears lest the art should be mutilated by unworthy hands.

There is no real or natural distinction between the general qualifications of a builder and an architect. Necessity certainly imposes a distinction, which, like many other subdivisions of employment, has both advantages and disadvantages; and the necessity is this, that the age requires speed, and, as far as possible, separates every art and branch of art and trade for considerations of economy and accuracy of execution. A former age could allow one man to design, superintend, and complete many a wondrous edifice; his minute and carefully studied invention, whether depicted on paper or not, would be developed by his own care as the works proceeded in a way that no specification could teach to others, while his intimate acquaintance with the construction of every part of that building on which his almost sole attention was placed would be such that few office-trained men can get, indentures notwithstanding.

As one who has seen much of building, from turning the grindstone up to the position of manager and principal, with several years' engagements as draughtsman, I am able to write without that angry class-feeling that sees the hobgoblins of the "scamping builder" and the "tyrannical architect" in every brick and stone. When too much is said of the latter I think of the dodges adopted to get through many jobs; the foolishness of those who take work at ridiculously low prices when they know it must be done well, and if so they must lose; of the unsatisfied client, who always thought the price was exorbitant. And when the former is rated (as by the way he too often is just now), I cannot but remember that keen competition and hard necessity induce many to cut so close that loss is certain; that the risk, casualty, and carelessness of workmen is all on their shoulders; that often both client and architect are exacting; that details are delayed and money scarce; or worst of all, perhaps, that a fee is expected or condemnation sure.

The talented, the proficient, and the employed of both sides need no law to protect them. The ignorant of both sides, who find they are not appreciated, would no doubt profit by any law that compelled people to buy at their shops; but no law would make me think that I could not draw a plan as well as most of the latter class, although neither time nor inclination would permit me to attempt such plans as a real architect alone has the qualification for.

In conclusion, I should be sorry to see any law of monopoly passed. The necessity for one such law would be argued as a reason for others, till in "Unions" all was lost but the selfish principle of exclusion—that has been the ruin of nations—and intolerance, the destroyer of energy and skill. —I am, Sir, &c.,

Triangle.

DECORATION OF REFRESHMENT ROOMS, SOUTH KENSINGTON.

Sir,—Verily there is no accounting for taste! After reading the admiring account in last week's Building News of the decorations to the refreshment room at South Kensington Museum, I could only look and wonder. I am not, I must say, an admirer of the works of the firm named. I cannot consent to ignore altogether the teaching of the past, and suppose that those nations which attained such pre-eminence in the arts—the Greeks and Romans—with all others, should be in the wrong. Yet it must be so if the practice of the firm be right, for the latter is opposed to all else!

The effort and aim in ancient decoration was to enliven and cheer—the effect of the firm's work is to sadden and depress. Assuredly, I may say, "melancholy has marked them for her own." I assert that the style of the room described is utterly inappropriate for the purposes of the place. In a *salle a manger* the character of the decoration should be bright and cheerful, whereas in this under consideration the predominant, all-prevailing hue is a dirty green, bearing associations of corruption and the charnel house; appropriate, perhaps, if we eat "meats for the dead," but in no way calculated to raise the spirits of the living. This murky mortuary compound, honoured as geeen, is made, we are told, of "black and yellow." This is not correct, as those pigments would not produce green; but it is sufficiently descriptive to give those who have not seen the place an idea of its dismal lugubrious effect. To my mind it is so positively forbidding that I expect it will not be without a prejudicial effect on the purveyor's interests.

It is satisfactory to see in the work of the firm evidences of thought and design; but it is a pity these artists will so obstinately choose what is strange, uncouth, and repellant in preference to taking their cue from ancient art, and studying to educe what would be generally pleasing. If, in the room under notice, a cheerful green had been used for the walls, and the woodwork treated with a sober shade of red, there would have been contrast, harmony, and pleasing variety—"variety is charming." As it is, the room but illustrates the old adage, that "too much of one thing is good for nothing.—I am, Sir, &c,

M.

ERRATUM.

Sir,—In the notice of "Gugliemo da Castelbarco" in your last number (p. 88, col. 2, line 52) "Conte" was printed for "Corte." The name of the historian I have mentioned should have been "Girolamo dalla Corte." I am sometimes guilty, it would seem, of making r's like n's, so that the printer becomes puzzled in words not familiar to him.—I am, Sir, &c.,

H. C. Barlow.

Intercommunication.

QUESTIONS.

[1905.]—CALCULATING EARTHWORK.—Would any of your contributors tell me what is the proper way of calculating the contents (cubic) of a cutting or embankment? Is the method by "mean heights" or "mean areas?" for I find they do not agree by a long way. As an example, I have a cutting 700 yards in length. The base is 30ft., the side slopes 1½ft. to 1ft., and the heights at each end 11ft. and 35ft. respectively. What is the number of cubic yards in it? I should be greatly obliged for this information, as I cannot get the same result by any two kinds of tables. or independent methods of working.—Young Engineer.

[1906.]—WEIGHT OF RAILS.—Is there any rule for proportioning the weight of a rail to that of the load it has to carry? We are continually witnessing heavier and heavier rails being laid down on our railways, and yet the traffic is pretty much the same. Is it a question of strength or of mere durability?—S. S. L.

[1907.]—SHRINKAGE IN CASTINGS.—At the recent competitive examination for appointments in the Public Works Department of India, one of the questions given was—"In making patterns for castings, how much shrinkage should be allowed for the contraction of the metal in cooling?" I should be glad to know what the allowance is, and still more, how it is allowed for, as that appears to me to be the most difficult matter.—J. M. D.

[1903.]—GEOMETRICAL PROBLEM.—As problems of this nature frequently appear in your "Intercommunication" column, and are well calculated to test the ability and zeal of your correspondents, allow me to propound the following:—If the vertical angle of a triangle be 120°, and the difference of the sides equal to 3·5 of the base, find the remaining angles?—Q. E. F.

[1909.]—HYDROSTATICS —A full solution of the following problem will oblige :—A solid cone floats with its axis vertical in a given liquid; compare the portions of the axis immersed. 1st, when the vertex is upwards; 2nd, when it is downwards.—R. L. B.

[1910.]—LIABILITY.—Will any of your readers oblige me with their opinion on the following statement of facts : —A asks B, who is an architect, to make plans and get quantities for a stable and cottage, and mentions £500 as the amount he is willing to go to. B accordingly gets out the plans and employs C, who is a quantity-taker, to make out the quantities. C is altogether unknown to A. The lowest tender for works is £1,100. B therefore modifies his plans and a tender is made of £850. A does not wish to pay more than £500, as originally contemplated, so the stables are not built. B and C both send in bills to A. Query. is A liable to either B or C, or both, and how much?—A. B. C.

REPLIES.

[1902]—SURVEYOR OF TAXES —In reply to "Assistant," I believe that the qualifications necessary to gain a berth in this capacity are as follows :—1. Writing from dictation; 2, arithmetic (including vulgar and decimal fractions); 3, English composition; 4, geography; 5, history of the British empire. I do not know who are the examining body.—Enrussed.

[1902.]—SURVEYOR OF TAXES.—As to the first part of your correspondent's question, there are no particular qualifications necessary, beyond a fair average education and a limit of age. The candidates have to appear before the Civil Service Examiners. "Assistant" should get a little book called "A Guide to the Civil Service." He will find it invaluable, as it contains many of the actual papers given at former examinations.—Clerk.

[1901.]- TESTING PORTLAND CEMENT.—There is no instrument for testing cement to be compared to that used by Mr. Grant on the Main Drainage Works. In fact, no one who has anything to do with testing cement would think of using any other. It was made by Adie, of London. —Test.

◆

STATUES, MEMORIALS, ETC.

The Brewster Memorial Statue.—The memorial to Sir David Brewster was inaugurated on Monday at Edinburgh University. The statue, which cost £600, and is by Mr. Brodie, R.S.A., is placed on a pedestal under the central arch on the west side of the quadrangle of the University. It is 7½ft. in height, weighs 3 tons, and is formed of Sicilian marble, the block selected being remarkably free from flaw or discoloration.

◆

WATER SUPPLY AND SANITARY MATTERS.

Aylesbury.—Mr. J. Bailey Denton has been appointed consulting engineer to the Aylesbury Local Board of Health.

Bedford.—The Bedford Corporation has hired about 150 acres of land for the purpose of turning to profitable account the sewage, which has hitherto been a great nuisance, and how well the scheme has succeeded may be judged from the luxuriant crops of grass and cabbages and various other vegetables now growing. The sewage is brought in large mains from the town to a point slightly elevated above the land to be irrigated, where it is collected in large reservoirs, and by means of a system of gratings is screened of all materials that would cause the sewage to block in the smaller carriers. From these reservoirs it is pumped into a tank raised sufficiently high to force the liquid in any direction and in any volume that may be required. Leads run at the head of the lands, and from these the sewage is conducted in carriers placed at given distances apart and at right angles to the leads. There is a contrivance for regulating the flow or cutting it off altogether by means of traps. The land is so laid that it is all served pretty well alike.

Bideford.—A new reservoir for the waterworks at Bideford is now in course of construction under the auspices of the Bideford Local Board. Mr. Baldwin Latham last week inspected the puddle trench.

Birmingham.—The Birmingham Town Council have under consideration a proposal to purchase 3,000 acres of land as a sewage farm. The cost of the scheme is estimated at from £250,000 to £300,000.

Chester-le-Street.—During the past few weeks great complaints have been made of the offensive state of the sewers in this town, and the stench from the grates has been unbearable. There has been such a small rainfall that the sewers have not been washed out for several weeks. With an abundance of river water at hand the sewers might readily be flushed once a week at a very small cost at least during the dry weather.

Croydon.—The prospectus has been issued of the Croydon Irrigation and Farming Company (Limited), with a proposed capital of £10,000, in 1,000 shares of £10 each. The company has been formed with a view to develope the practical application of sewage to agricultural purposes. The Croydon Local Board of Health has agreed to grant the company a lease of about 500 acres of land in the parishes of Croyden and Beddington; and to deliver to the company the whole of the liquid and solid sewage and refuse of the town of Croydon. The Board has also agreed to let to the company the filter works and land at Croydon and Beddington, and to deliver on to the works at Croydon the whole of the refuse collected in the district. The extraction of the solid matter from the sewage will be effected by the newly-patented process of Mr. Baldwin Latham, C.E., the engineer to the Local Board, and it is intended to manipulate and manufacture the solid manure extracted from the sewage by this machinery, and make it into a portable manure.

Dronfield.—Mr. Coke, surveyor, of Chesterfield, has offered to supply Dronfield and Unstone, with water. It appears that Mr. Coke is now making a survey in the valley between Millthorpe and Crow Hall, with the view of making a large reservoir for the supply of Staveley, The place chosen for the supply of Staveley is said to be the only source from which the inhabitants of Dronfield can get a sufficient supply of water for domestic, sanitary, and manufacturing purposes.

Duties of Sanitary Committees.—We read in a Cambridge paper that the sanitary committee of St. Ives (Hunts), have been making a tour round the town, "and we are sure," says our Cambridge contemporary, "if they carry out their duties many grievous nuisances now existing will be removed." We are also sure that it would be to the advantage of other towns were their sanitary committees (if only occasionally) to emulate the example set by that of St. Ives.

Esher.—The directors of the Lambeth Waterworks Company have, upon the requisition of the inhabitants, agreed to furnish a water supply to this village from their mains at Seething Wells. This has long been needed.

Trowbridge.—The petition presented in Chancery for winding up the Trowbridge Water Company was accepted on the 15th ult., without opposition. Want of capital was the cause of failure. The inhabitants are now without any direct source of supply of water.

Utilization of Sewage at Ely.—The Ely Local Board of Health lately appointed a committee to visit the Croydon, Barking, and Romford sewage irrigation farms, and to report on the feasibility of carrying out this system of dealing with town sewage at Ely. The committee has reported in favour of irrigation, and it is to be tried experimentally.

Waltham Abbey.—The Waltham Abbey Local Board of Health has adopted the plan recommended by Mr. Sendey in respect to the new drainage and the collecting of the sewage into two tanks in the town mead.

◆

Our Office Table.

Cheap Railways.—We have on previous occasions referred to the cheap railways and economical rolling stock which, by Mr. Fairlie's method, could be rendered available. A trial was made the other day on the Festiniog Railway, in Wales, in presence of engineers from many parts of the world, which seems to settle the question. The gauge of the line is 1ft. 11½in. only; the locomotive, running on a "double bogie," weighs 19½ tons, and it drew a train weighing 114 tons from Portmadoc to Festiniog (fourteen miles), all the way uphill. There were times when the train was running on five curves at once, and without difficulty, owing to the bogies, which yield easily to every bend. Here, then, is an indication of the kind of railway suited to hilly districts which have passengers or merchandise of any kind to send down to the plains. There is room for such in England, while in Canada and India there are wide regions that might be benefited by the light narrow railways, and where the ordinary gauge would be too costly.

Street Cleansing and Watering.—Mr. Thos. Page, the well-known civil engineer, proposes some measures for the much-needed reform of the London streets. He condemns the present system of pouring water almost indiscriminately over streets from which the dirt and manure have not first been removed. This objectionable system (for ignorance has its systems) is most expensive, and continually obstructs the passage of vehicles. Another nuisance, equally to be condemned as injurious to the general health and traffic, is the dust-cart system. These sources of disease are in use at all hours of the day. He suggests that the streets should be swept by boys, who could also water the streets by means of hose-pipes screwed on to the mains. When out of 2,800,000 inhabitants in 1861—say 3,500,000 at the present time—there are 127,600 persons called paupers, who have to be supported by their fellow-subjects, the labour of such persons ought to be made available in placing the metropolis on a better footing in its sanitary arrangements.

Destruction of Grecian Antiquities.—Those who are interested in Grecian antiquities will read the following extract from a recent letter with regret :—"The walls of the Acropolis of Assos appeared to have suffered most, being almost levelled to the ground. The gateway in the lower part of the city is still intact. After the destruction of many structures and shipment of part of the material for the construction of the new forts at the Dardanelles and for other purposes, the cost of transport was found too expensive, and the work of destruction was suspended, to be renewed, no doubt, when a cheaper mode of conveyance may be organised, or an urgent demand for building material arises. The remains at Alexandria Troas are more likely to suffer than those at Assos, being in closer proximity to Constantinople and the Dardanelles, and continued raids are made on these ruins. The gymnasium of Alexandria Troas (erroneously called Priam's Palace), notwithstanding its gradual rapid disappearance, is still a fine and imposing building," The *Pall-Mall Gazette* asks "Ought not our ambassador to interest himself in the preservation of the remaining monuments of a civilization which has exercised so great an influence on mankind?"

The Brighton Aquarium.—The works in connection with the aquarium about to be erected on the beach have been commenced. The foundations, of the sea wall on the south side have been dug and the place has been barricaded in. The works are to be pushed on vigorously, so that there is every probability of the aquarium being opened to the public by the 31st of December next.

Mortuaries Wanted.—The almost tropical heat which has prevailed of late is enforcing upon the attention of vestrymen and other officials the question of mortuary accommodation in large towns. It is specially horrible to contemplate at this time of the year the keeping of a corpse for three or more days in the same room in which very often one or more adults and four, five, or six children have to sleep. The question has been mooted at the Lambeth vestry, but with no satisfactory result. Mortuaries must, sooner or later, be provided. Why should they not be erected forthwith?

The Corporation of London and its Surplus Land.—There was a discussion on the finances of the Corporation of London at a recent meeting of the Court of Common Council. Attention was drawn to the fact that while the City authorities possessed a great quantity of unproductive surplus land, very large bonded obligations had been contracted in carrying out the great public works which had been undertaken. The estimated value of the surplus land is £1,500,000, the interest on which, at the rate at which the Corporation had been borrowing money, represented an annual income of £63,750.

Bells for Temporary and other Churches. —Mr. Thomas Walker, bell-ringer, of Hull, writes as follows :—"I have long been of opinion that great improvements might be made on the principle by which small bells are fixed for temporary and other churches. As at present, the bells are made to swing, and being small and light, the effect whilst tolling is much like the quick ringing of dock bells, or bells used at 'feasts and fairs.' Having devoted considerable time to the study of bells and bell-ringing, I would suggest that, in all cases where small bells are fixed for temporary and other churches, the bell should be made a fixture, and a small cord attached to the clapper and passed through a sheave or pulley fixed in a horizontal position. I think that this would be at least an improvement on the ordinary plan; more tone would be produced, and the bell could be tolled slowly, and by that means it would appear more like the toll of the 'church-going bell.'"

Dover Harbour.—The *Dover Express* reports that the Harbour Board has instructed an eminent engineer to prepare plans of extensive improvements in Dover Harbour, which they have determined to carry out as speedily as possible, and which will give as much accommodation for vessels as that which is to be provided on the French coast, in order to carry out Mr. Fowler's scheme of improved international communication.

Projected Boulevard for Hull.—Mr. J. F. Sharpe, surveyor to the Hull Local Board of Health, has proposed that a boulevard shall be laid out, commencing from the Humber bank, at a little distance eastward of the point where the Albert Dock Promenade terminates, and extending, for the present, to the Anlaby-road. At a later period it will, in all probability, be continued to the Park, and possibly, at a still subsequent period, to the river's bank on the eastern side of the town. The proposal has been rendered financially practicable by the public-spirited offers of the landowners of the neighbourhood. Mr. Constable, one of the latter, has offered, instead of constructing a street through his property 40ft. wide, as he had originally intended, to give additional land which will make it 80ft. wide; to give other land which will make a road 20ft. wide (to be planted with trees) between the southern end of the boulevard and the Albert Dock Promenade, making the boulevard altogether three-quarters of a mile in length; to give £2,000 towards the expense of making the road; to give additional ground to form circuses where the road is intersected; to give £250 towards the cost of a drinking fountain, which will form one of the features of the boulevard; and to give sites for a new church and parsonage. The Local Board has resolved to carry out the work, the cost of which will be £7,000.

LATHE FOR TURNING BANISTER RAILS, &c.—Mr. G. Sconcia, of New Coventry-street, Leicester-square, has just brought to this country a new self-feeding lathe for turning banister or wainscot rails, whip handles, chair-rounds, or any article of a round shape on which undulations of an ornamental character are required. The blanks, square in section, are put in at one end of the apparatus, and they pass out at the other end in a finished state, taking as they go the shape of a pattern-plate fixed to a slowly-revolving wheel at the side. The machine works very fast, the cutters running at an amazing velocity to act upon the blanks. It is said that there is no limit to the number of articles this lathe can turn out. Anything of a plain, tapered or irregular shape can be made by it. All that is necessary is to adjust a pattern of the work wanted, which guides the chisels; then put in the length or square of timber at one end and it will speedily appear at the other end smoothly finished. The finished work is said to be turned out by this lathe about ten times faster than can be done by the ordinary lathe. Mr. Sconcia proposes to start a limited liability company to work the invention, so that decorative carpenters, upholsterers, and others can be supplied with any quantity of rails, &c., in a short time, and at far less cost than they can have them turned at home for.

THE DINGWALL AND SKYE RAILWAY.—The Government inspection of this new line commenced on Friday last. Captain Tyler, R.E., was accompanied in his survey by Mr. Mackintosh, of Raigmore, M.P., and Mr. Dallas, of Dunain House, directors; Mr. And. Dougal, general manager; and Mr. Murdoch Paterson, the engineer. Up to Saturday night the Dingwall contract (Messrs. Grainger's), extending from Dingwall to Achanalt Inn, a distance of 21½ miles, had been gone over, the bridge and culverts being tested by the weight of three engines; and the whole construction was considered satisfactory. It was intended to open the line for goods traffic on Thursday, and for passengers on Monday last, the formal opening taking place on the 10th.

DEATH OF MR. J. B. PYNE.—Mr. J. B. Pyne, the artist, who was for many years Vice President of the Society of British artists, died at his residence in the Camden-road on the 29th ult., in the seventieth year of his age. Mr. Pyne was a native of Bristol, and when a lad was articled to an attorney. The law was not, however, to his taste, and he soon abandoned it to follow the more congenial pursuits with which his name has become associated. His views of the English lakes, and his Italian scenes, are the works by which he is best known. Mr. Pyne had been ill for many months, and for some time but little hope had been entertained of his recovery.

THE NEW COURTS OF JUSTICE.—The expenditure upon the new Courts of Justice up to the 31st of March, 1870, slightly exceeded £900,000, from which must be deducted about £10,000 for the proceeds of the sale of old materials. This expenditure was for the purchase of the site, with incidental and preliminary expenses. At present the statutory limit of expenditure for the erection of the new courts and offices stands at £750,000.

THE ROYAL ACADEMY AND THE WORKING CLASSES.—A short time back Mr. George Potter addressed a letter to several of the newspapers, suggesting that on a certain evening the exhibition of the Royal Academy should be open for the gratuitous admission of the working classes. Mr. Edmund Yates, writing on the subject, says:—"Mr. Potter may know a great deal about trades unions and working-men, but he evidently knows nothing about the Royal Academicians. He imagines their mission is to diffuse a knowledge and love of art; they know that it is to accumulate shillings. Not 'a thing of beauty,' but eightpence profit on a catalogue is 'a joy for ever' to the large-souled old gentlemen who have the guidance of affairs at Burlington House."

WIRE TRAMWAYS FOR STONE QUARRIES.—Lord Kinnaird is at present putting up Hodgson's wire tramway for the transit of blocks of stone from a quarry situate in Hilltown, a little north-east of Rossie Priory. The Duke of Sutherland also intends to construct a ten miles' length, to transport limestone from Loch Shin to Golspie Harbour.

THE GROSVENOR GALLERY.—The Marquis of Westminster has allowed the authorities of the South Kensington Museum to select for exhibition any pictures from the Grosvenor Gallery for which space can be found. Many of the finest works have been accordingly removed and will be exhibited in a few days.

THE NEW BREAKWATER AT WICK.—The reconstruction of the portion of the new breakwater at Wick which was thrown down by the storm of February last is now being vigorously carrried forward, and already a large portion of the work has been completed. The breakwater will, in future, be built solid throughout, with large stones placed on edge, and the whole will be set in Portland cement to as low a level as can be attained. Already the greater portion of what was proposed has been completed.

THE SEVERN LOCKS AND WEIRS.—Sir Edmund Lechmere and other members of the Severn Committee have just made their first official survey of the new locks and weirs now being constructed on the Severn, at Gloucester, under the superintendence of Mr. A. Williams, from the designs of his father, Mr. E. L. Williams. The works comprise a lock and weir at the upper parting, in the Maisemore Channel, and a second lock and weir much more extensive in the eastern channel. The cost, £20,000, has been guaranteed in equal sums by the Gloucester and Berkeley and the Staffordshire and Worcestershire Canal Companies. The works have been in progress for some months, and it is expected the chief weir and lock will be so far completed that boats will be enabled to pass next November. The guaranteed effect will be an uniform depth of 7ft. of water in the eastern channel, which is of chief use to Gloucester commerce, but which of late years had been gradually silting up. Already an increased depth of 2ft. has been secured.

Chips.

THE foundation stone of a new Primitive Methodist chapel at Frodsham Bridge, Cheshire, was laid the other day.

A new chapel for the United Methodist Free Church has just been completed at Wisbech, Mr. Kerridge being the architect, and Mr. Beeton, of Hunstanton, the builder.

The foundation stone of a new manse for the pastor of the Unitarian congregation at Moneyrea, Ireland, was recently laid. The building will cost £400.

The men in the employment of Mr. J. G. Naylar, contractor, of Rochester, held their annual beanfeast on Saturday week. About one hundrod sat down to dinner.

It is proposed to form a limited liability company at Guildford for the establishment of public baths.

The Hailsham Cattle Market Company have resolved to apply to Parliament for powers to erect a new cattle market without the limits of the town.

Wirksworth Church, Derbyshire, is being restored by Mr. G. W. Booth, builder, Gosport. The cost will be £7,600.

The foundation stone of a new chapel and school for the United Methodist Free Church was laid last week at Gauber. Messrs. Taylor and Son, of Barnsley, are the contractors for the mason work.

Owing to the disturbed state of the Continent, it has been decided to postpone the proposed exhibition of the works of Holbein at Dresden until next year.

The death at the advanced age of eighty-eight of Mr. Benjamin Thorpe, the archæologist and antiquary, is announced.

Mr. Manfred Holyoake, who retires from the post of curator to the painting school at the Royal Academy, is to have a testimonial, which will probably take the form of a portfolio of original sketches by the academy students.

The foundation stone of a new Primitive Methodist chapel was laid at Kilnhurst on Monday week. Messrs Wilkinson Brothers of Swinton Bridge, and Mr. Joseph Morley, of Grasbrough, the plans being by Mr. Kerridge, of Wisbech.

The new church of S. Stephen, Byron-street, Liverpool, is to be consecrated to-day (Friday).

At the recent meeting of the Wesleyan Conference at Burslem, it was stated to be the intention of the Wesleyan body to erect ten new chapels in London during the next year, at a cost of about £20,000.

Lord George Hamilton, M.P., will lay the foundation stone of Christ Church, Victoria Park-road, to-morrow, Saturday.

St. Mark's Church, Sandringham-road, West Hackney, will be consecrated to-morrow (Saturday) by the Bishop of London.

The memorial stone of a new school, in connection with Grove-street chapel, South Hackney, was laid on Wednesday week.

An additional aisle is being erected at the church of St. Mary Magdalene, Paddington.

A new burial ground for Southend has just been consecrated by the Bishop of Rochester.

The new church of St. Andrew, Plaistow, was consecrated on Friday last.

The foundation stone of a new school for the Primitive Methodists of Caistor was laid last week.

A large billiard room has just been added to the Royal and Fortescue Hotel, Barnstaple, from a design by Messrs. Gould and Sons, architects, of that town.

The Balsham Union Chapel, Balsham, Cambridgeshire, was re-opened on Tuesday week, after repair and enlargement under the direction of Mr. Clay, architect, Bentinck-street, Cambridge.

Miss Burdett Coutts laid the foundation stone of a new national school for the parish of St. Ann, Highgate-rise, on Wednesday week.

A meeting of the creditors of Mr. Magnus, of the Pimlico slate works, was held on Wednesday week at Dyers' Hall, Dowgate-hill. Liabilities £35,411., assets £47,641. It was resolved that Mr. Magnus should carry on his business as heretofore, and that time should be given to realise the property without sacrifice, and the creditors be paid in full. Mr. H. Farren, secretary to the Valencia Slate Slab Company (Limited), was unanimously elected trustee.

The curatorship of the school of painting in connection with the Royal Academy of Arts has been declared vacant. It is intimated that artists desiring the appointment may make application until the 13th of August.

On Saturday last the Bishop of Manchester consecrated the new church of S. Paul, Low Moor, Clitheroe. The edifice, which is in the Gothic style has cost £6,000.

The foundation-stone of a new church at Lilley, Herts, was laid on Wednesday last, by Mrs, Lilley, wife of the lord of the manor.

At a meeting of the Southmolton Local Board last week the sanction of the Secretary of State was received to the borrowing of £3,000 by the Board on the security of the district rates, the money to be employed in various works.

The large silk mill for Mr. Hilton, at Leigh, Lancashire, is now nearly finished The mill is from a design by Mr. Hartley Hacking, architect, Manchester. Messrs. Wade and Co., of Miles Platting and Manchester, are the builders.

Haslemere parish church, Surrey, is now in course of restoration. The work is entrusted to Mr. Harris.

A new Wesleyan chapel and day schools are now in course of erection at Doncaster. Mr. H. Arnold is the builder.

A building has been commenced at Barnard Castle for a museum of art and science. When finished, it and its contents are to be handed over to the town authorities, Mr. and Mrs. Bowes being the donors.

A new infant school, in connection with S. George's Church, Tyldesley, is about to be erected from plans by Mr. C. S. Whitehead, C.E., of Atherton. The style adopted is Elizabethan.

Timber Trade Review.

We give below a list comparing the prices of timber, deals, &c., before the declaration of war and those obtained since. This may be some guide to builders, as the prices are not those which are or have been quoted by merchants, but, as far as our knowledge goes, have been actually paid. Only in a few instances is the difference very serious, but whether great or small it is advisable to know it. Less or more may have been paid by individuals, but the list represents a fair average on both sides:—

		Before.			After.

THE BUILDING NEWS.

LONDON, FRIDAY, AUGUST 12, 1870.

WORKMEN'S INTERNATIONAL EXHIBITION OF 1870.

IN previous Working Men's Exhibitions the preponderance of mere amateur work, produced by men whose ordinary occupations bore no analogy to the work, did much to discredit the idea. It would have been as absurd to look for real excellence, or a means of advancing art education and technical knowledge, in oil paintings by coal-heavers, mechanical contrivances by lawyer's clerks or postmen, and other incongruities of the same kind, as it would be unkind and unwise to criticise the result with a very close scrutiny. So many allowances had to be made for the difficulties of production that the few words of general praise which they received were due rather to the industry and patience of the exhibitors than to the excellence of the work. Skilled workmen, as a rule, stood aloof from such exhibitions. They could appeal to the judges only upon the ground of superior workmanship, and would naturally decline competition with amateurs, who claimed a charitable consideration of their many disadvantages. Hence one became inclined to class the so-called Workmen's Exhibitions with other benevolent institutions for economizing leisure and preventing vice, but—barring the occasional chance of their bringing forward an unknown Arkwright or Watt —the expectation of technical advancement from them had to be entirely given up.

We have remarked, in our previous article upon the presence of many articles of mere amateur production in this exhibition, and would suggest that if not entirely banished from future exhibitions—which is perhaps not quite possible or desirable—they should at all events be exhibited by themselves. When articles have to be judged by different standards it can serve no useful purpose to place them side by side. If separated, it would be practicable to caution visitors to expect no more from them than that the exhibitors have done "the best their circumstance allows;" while in the other part of the exhibition the very best result that skill and industry can bring about might fairly be expected, and every exhibitor would expect to be criticised and tested with the utmost impartiality.

Class 8.—Building Appliances.

In this department, according to the catalogue, Great Britain numbers 71 exhibitors, Italy 10, the Netherlands 9, Austria 1, and Bavaria 3. Of foreign countries, that of the Netherlands is by far the most interesting, containing, as it does, a series of drawings and carpenter's work executed by the pupils of the Industrial School for Sons of Workmen at Amsterdam. This institution affords systematic technical instruction to the sons of journeymen, and the results shown here form a special feature, to which we hope to revert. The want of classification renders a systematic examination and comparison of the objects exceedingly difficult—almost impossible. After some trouble, we found a stand where some building appliances were placed, but articles not belonging to the class were there, and others we discovered, some in one place and some in another—some were not found at all; and neither catalogue nor direction in the building could show us where they were. Moreover, we dare not trust the catalogue for directing to everything of its class, for among building appliances we find catalogued "watchmen's clocks," "hinges for dressing cases," "jewel and dispatch boxes," "model of horizontal slide valve engine," and—a "doll's house!" If, on closer inspection, we find the same confusion in other classes, we feel bound to say that, however well the exhibition may suit the thousands who are attracted by the bazaar arrangements—which the managers appear very anxious to enlarge—and by the evening brass band, the exhibition must prove a failure as to its professed and legitimate objects.

Among the seventy-one exhibitors of Great Britain, ten are for models of buildings, or parts of buildings, exhibiting no novelty or improvement whatever, and if remarkable at all, only so for the neatness of the modelling. We except, however, the well-known tripartite labourers' cottages exhibited by Mr. Henry Martin, secretary of the Cottage Improvement Society, Arundel-street, Strand. There are two designs by workmen for improved workmen's dwellings. One only, however, No. 54, by Thomas Smith, builder's-foreman, Halstead, was discoverable. One might fairly expect to see more effort made in this direction by the working men themselves. They should make use of exhibitions like the present to tell those who are inclined to build for their comfort what they really do want for themselves.

There are several improvements in window-sash frames and ventilators. The first we noticed was the work of a journeyman carpenter, Robert William Parsons, A 14, Pink's Row, Lever-street, St. Luke's, catalogued in class 3, No. 391. In this, the lines upon which the sashes are hung are fastened by a fitting at the bottom of the line by which the sash can be removed and replaced without nailing the line. A pin passing through the bead at the side is made to be removable, so that the window can be easily taken entirely out for cleaning, &c., without trouble. This model is also fitted with a perforated zinc ventilator at the top, which can be regulated to drop to various lengths, and permit the top sash to be opened to ventilate the room without draught. The invention is very simple and meritorious. Thomas Smith, shipwright, Southampton, exhibits a regulating ventilator, in which glass is fixed louvre-fashion behind the top sash of an ordinary sash window. W. T. Frewer, bricklayer, Holland-street, Blackfriars, has an improved window-sash, with a slide which can be withdrawn and allow the sash to be turned round for cleaning. Mr. Benjamin Abraham, builder, Hind-street, Poplar, exhibits a pair of sashes and frame, in which he combines, by the addition of hinged movements, the advantages of the French casement and the sash window. Henry Omer, decorator, Mile End-road, E., shows sash-frame intended to effect the same objects as the preceding. The construction appears rather complicated, as will appear from the following description:—"Unfasten and pull up both sashes a few inches, which will allow the bead to be removed so as to allow the sash to be taken out. The left-hand bead will then lift up and come out, so as to admit of the sash being taken out. Three studs are fitted to bead, which is made to take in and out of frame, and fit close to sash and frame to prevent draught. The parting bead on the same side will fold back, as it is hung on three brass hinges, allowing the top sash to come out (which is made the width of parting bead narrower than bottom sash). The lines will unhook from sashes on both sides, or from one side only and left hanging by the other, as may be approved by the cleaner."

Mr. Henry Morgan, carpenter, 40, Rochester-row, Westminster, has an invention consisting of a double-action pulley for single and double-action doors. This consists of a spring upon a drum fixed in the doorpost at the top, and connected with the door by a strong catgut rope. Its working is very simple and easy, and it appears to be well adapted for doors where, from the presence of arches or iron girders, as in fireproof buildings, for example, sufficient space is not left for the introduction of the ordinary box spring. The same inventor has also a sash with pulley without weights, in which one sash is made to balance the other; a self-acting balance shutter, likewise without weights; and various improvements for the doors of railway carriages, in the shape of small india-rubber insertions, to prevent noise from shaking of window-frames, slamming of doors, &c.

The model of a geometrical staircase (No. 26) by Samuel Mead, joiner, Calthorpe-place, Birmingham, is deserving of great attention, if only for the excellence and finish of the model itself. But the exhibitor deems the model an improvement upon the ordinary geometrical staircase, the strings being so constructed as to develope the scrolls more gracefully than the usual curtail step.

On the whole, we can hardly think the workmen employed in the building trades have done themselves justice in this exhibition. One workman exhibitor accounted to us for the paucity and want of variety in the objects shown. "Lor, sir," said he "there was very few of 'em as knowed anything about it, and them as did, and had got any improvements, did not like to bring 'em out because of the patent. Why, I knowed nothing about the Act myself till a day or two before the exhibition opened, or I should not have been here myself."

For the benefit of those who do not know about "the Act," we add that a recent Act of Parliament gives to workmen exhibiting here the same privileges as if they had paid a fee to register their inventions for six months. This affords them time to get their improvements tried, discussed, and taken up; and if this fact were more generally known we are sure that many who are hiding their contrivances away would avail themselves of the opportunity, and the building department would make a more respectable appearance.

◆

THE WELLINGTON MONUMENT IN S. PAUL'S CATHEDRAL.

THE grandest project which has in modern times been set afloat in this country is the noble scheme for the completion of the decorations of our magnificent Metropolitan Cathedral at an expenditure of probably £200,000; and, in addition to these decorations, one of the most ambitious objects in the Cathedral would be the monument which a grateful people has decided to erect to the memory of its great warrior—Wellington. The monument, ordered in 1856, is not yet visible; and a very remarkable Parliamentary paper just issued explains the present position of the affair, and is most opportune in its appearance, as affording the subscribers to the decoration fund some idea of the manner in which their contributions will be husbanded, and the result likely to be obtained by their liberality.

In 1856 the Government invited sculptors and others to submit in competition models and designs for the monument which it had been determined to erect in memory of the Duke of Wellington. In answer to the invitation, eighty-three designs were submitted, and the authors of nine of these were selected as deserving of premiums. In 1858 the then First Commissioner of Her Majesty's Works appointed Mr. Alfred Stevens as the sculptor to erect the monument, and also appointed Mr. F. C. Penrose, the cathedral architect, to superintend Mr. Steven's work, and "to certify from time to time the amount of money to be paid to him on account." A sum of £20,000 was voted by Parliament for the monument, and in September, 1858, a paper was sent to Mr. Stevens from the Office of Works offering him £11,000 for his monument, thus reserving £9,000 for the collateral works. Subsequently, at Mr. Stevens' pressure, the amount fixed for the completion of the monument—including a full size model to be set up in the Cathedral—was £14,000. Mr. Stevens now goes to work, and takes a lease of extensive premises for the purposes of the model, and on November 19th, 1858, we may consider it as having been commenced. A period of about two years elapses, during which Mr. Penrose has certified for various sums to be paid on account; and on December 28th, 1860, a further sum is about to be paid to Mr. Stevens, which, with the other payments, makes a total sum of £2,200 advanced to him up to this date, and we find him willing to guarantee that the model shall be completed forthwith, without a further request for payment, if another £600 is advanced to him, making altogether £2,800. The last £600 does not, however, seem to have been advanced to him. Another long period elapses, during which the First Commissioner has been anxiously inquiring after the model; and on December 6, 1862, Mr. Stevens assures the First Commissioner that the model is progressing, and asks for a further sum of £2,466, which, with the £2,200 already received by him, will make £4,666—a third of the entire sum to be paid to him—and which, it is stated, is a customary arrangement among sculptors. The £2,466 is paid to him in February, 1863, on condition that the model is complete and ready for inspection in S. Paul's Cathedral within fifteen months from the day on which such sum is received by him. There is now a blank in the correspondence till February 19th, 1864, when the First Commissioner intimates to Mr. Stevens that the time is approaching for the completion of the model, and other reminders on June 27th and August 13th, 1864, to the effect that such time has elapsed. No answer is received by the Commissioners to either of these letters; but, on March 25th, 1867, Mr. Stevens writes to say he is doing his utmost to hasten the work; and on 17th January, 1867, Mr. Penrose writes to the effect that the model is so far completed that the execution in the permanent materials might be properly commenced if the general design is considered satisfactory by the First Commissioner. On March 12th, 1867, we find a further sum of £2,800 is directed to be paid to Mr. Stevens. The work drags on, and after other advances have been made, the total amount certified by Mr. Penrose has amounted to £12,466. At this date, December 20th, 1869, Mr. Penrose claims his commission of 2½ per cent. on the amounts paid to Mr. Stevens and to other artists. On December 29th, 1869, he sends his statement of the whole matter as it stood respecting Mr. Stevens. On the 9th of April, 1870, the First Commissioner himself visits the studio of Mr. Stevens, the result of such commendable visit being that on April 14th, 1870, the Director and Surveyor of Works are appointed to meet Mr. Penrose and Mr. Stevens for the purpose of making a report on the then condition of the work. The report is made by Mr. Douglas Galton and Mr. Henry Arthur Hunt, who estimate that to complete the monument, irrespective of Mr. Penrose's claim, will cost a sum of about £15,000, or roundly, a sum equal to the amount of the original contract. A letter of the 20th July, 1870, from the First Commissioner puts an end to the employment of Mr. F. C. Penrose as consulting and certifying architect, and another letter of the same date determines the contract of Mr. Alfred Stevens.

The perusal of this correspondence cannot fail to strike the reader as possessing a peculiarity in the system of granting certificates adopted by Mr. Penrose, and as evidencing the patient long-suffering by the Commissioners of Works throughout the whole wearily-protracted period the monument has been in hand; and any professional man indulging in such, to say the least, loose conduct of the interests entrusted to his care cannot object to his system being criticised and analysed in a decisive manner. On Mr. Penrose's appointment as certifying architect we find him commencing his duties with remarkable activity. Within six weeks from Mr. Stevens's agreement to do the work Mr. Penrose certifies for £400, when the "skeleton frame" only for the "model" was in hand. Other advances are certified by Mr. Penrose, although the model, even, is not completed, and these sums are gradually approaching the amount of the contract—which fact should have opened Mr. Penrose's eyes, and determined him to calculate the amount of work to be done, and the sum left to do it. Had he thus proceeded it would have been seen at once that to complete the monument would involve an outlay far above the small sum left from the total amount of the contract, and Mr. Stevens's pleadings for further advances should have convinced Mr. Penrose that he (Mr. Stevens) was not in a position to complete the work without such additional sum having been advanced to him; but throughout, the fact of a contract having been entered into seems to have been ignored by Mr. Penrose, and he appears rather to treat the matter as if it were a question of his own estimate of the art-value only, and to be quite regardless of the fact of a fixed contract sum having been entered into; and in his statement of December 29th, 1869, to the Office of Works, he quite confirms this view, for he says:—"I am certain that, however far from complete the monument may be when the stipulated sum of £14,000 has been expended, it will be fully worth the money—even quantity for quantity—as compared with the price of other monuments." This, be it remembered, is a statement made by an architect who is employed to certify from time to time the instalments due on the gradual execution of a contract. Such a statement could not but awaken the Office of Works, and draw from the First Commissioner a definite request, and accordingly the Director and Surveyor of Works are requested to report upon the condition of the work; and such report reveals that the sum voted by Parliament for the monument complete was £20,000, that Mr. Stevens had been paid £13,006, and other artists £4,900, making a total of £17,906, and the estimated future expenditure being £15,600, makes the total expenditure for the work, which was to have cost £20,000, amount to £33,506, exclusive of Mr. Penrose's claim. And it must be borne in mind that a considerable concession was made in allowing the model to remain in the studio of Mr. Stevens, at Hampstead, instead of being set up in S. Paul's Cathedral, as originally intended and contracted for.

That conduct such as the above should have resulted in the discharge of Mr. Penrose and the termination of Mr. Stevens's contract can surprise no one, the only wonder being that so important a work should have been allowed to drag on for so many years, and that the discovery of the peculiar method of procedure adopted by both sculptor and certifying architect should not have been before made. The Parliamentary paper is completed by a serious of sketches shewing the present condition of the monument, and the work required to complete it; and the consideration of these delineations renders it a matter of much surprise that an architect appointed to a responsible position should have allowed himself to take the course which this correspondence shows Mr. Penrose to have taken. He may be able to explain and justify such conduct, but to be of value this explanation must be prompt and explicit.

◆

BUILDERS *VERSUS* ARCHITECTS.

It is impossible not to sympathise with two of the letters that appear, one from "A Surveyor" and the other from "Triangle," in our last week's issue. If any of our readers have not perused them we recommend them to do so, and see how well-timed is our oft-repeated invitation for such communications. If those who *can* write, but never professionally write (by the line), would oftener contribute a letter now and then anent the vexed questions of the day, how much good to the professional body we represent would be effected! It often happens that such "outsiders" (to borrow a sporting phrase) hit upon a useful idea that ought not to go unnoticed, but which, in the pressure of other matter, might be—and often is—passed over unnoticed by the professional contributors to our journal. We wish our columns of "Intercommunication" and "Correspondence" to serve as really a sort of architectural *plebiscite*, by whose utterances our readers may be both guided to the adoption and encouraged to the adhesion of all that is true and wholesome for both architects and builders.

"Surveyor" discourses well and usefully on a recent movement of the Institute of Architects, by which it is proposed (in dealing with builders) to constitute the seven years' members of that body, yclept "Fellows," arbiters for all time in disputes that may arise touching building contracts. He shows—we think conclusively—the absurdity of such a scheme. Let us examine it, perhaps somewhat more closely than our correspondent himself has done, judging from his own brief and intelligent strictures on the scheme.

It is, what ?—a scheme of arbitration intended to operate on builders. Where ? In the metropolis ? Oh ! no; throughout all England. Now let us inquire what is the position of the Institute of British Architects with respect to builders out of the metropolis. The answer to be truly made and maintained is this:—The Institute is a London club of architects, with a *coterie* of provincial antiquaries and *dilletanti* (all highly respectable) affiliated to it, with here and there some other provincial architects who belong to it, and pay their two or four guineas subscription to it merely to add A.R.I.B.A. or F.R.I.B.A. to their names, just as Mr. Street, with like professional pride—but far higher consistency, merit, and honour—appends A.R.A. to his signature at the corner of a contract drawing. A.R.A. (Associate of the Royal Academy) *is* a *bona fide* passport to professional distinction. It means a host of things, all of them meritorious and well known to the true architect, which are by no means peculiar to—nay, which may be utterly wanting in—the man who can merely flaunt in your face (or in the "Post-office Directory") his F.R.I.B.A. Mr. Street himself is an F.R.I.B.A. We don't deny it. Just in the very self same way wherein Rubens and Wren were "Sirs;" but whoever thinks of the mere knighthood of "*optimus Christopherus Wren*," or of the "Sir" reverence of Peter Paul Rubens ? We question, indeed, whether any one of our English painters in fifty is even aware that Rubens ever was "Sir Peter." We have ourselves met with many who were utterly unconscious of the fact.

However, we are losing sight and mind of our correspondent the "Surveyor." He says, and truly, the training and acquirements of a Fellow of the Institute do not qualify him for—nay, make him utterly unfit for—the coveted post of arbiter in matters of dispute between architects and contractors, or between architects and clients; and we quite recognise the cogency of his argument. A Fellow of the Institute in London is an architect, who by the provisions of his own Charter and Bye-laws, is precluded from measuring-up, estimating, and valuing any work of which he is not the proper architect; and who, as a rule (being quite unused to that sort of thing), *never* measures up or values his own works; but calls in a surveyor to do it for him, and arbitrates on that building surveyor's report. Such men, however learned as antiquarians, or eloquent as speakers in Conduit-street, will never be able to get builders to have confidence in them, nor will they be able to officiate as arbitrators or referees in London.

In London, business of this kind will of necessity fall into the hands of London building surveyors—a very intelligent class of men. In the provinces, the functions of a seven years' fellow of the Institute would be simply *nil:* and for this reason—that however disposed a provincial architect (to the scorn of fellow provincials) may be to put "F.R.I.B.A." to his name, he virtually would ignore the Institute scheme condemned by our correspondent. He, Fellow though he is, takes out, as a general rule, his own quantities, and measures up and adjusts his own "extras and omissions," and allows, country architect as he is, no *imperium in imperio* to come "betwixt the wind and his nobility" (*i.e.*, management of his contract) in the shape of a building or quantity surveyor. Let anyone who doubts this institute a provincial committee of inquiry, and he will find how local is the influence and rule of the Institute. Let him look east, west, north, or south out of the metropolis—let him, for example, take Hastings, in Sussex, for his southern point, up to Manchester, Preston, and Liverpool for his northern point; he will find the *animus* and the *consensus* of English architects to be, to all intents and purposes, dead against the *regime* of of the Institute. The Institute, indeed, will have to alter its *regime tout cela*, and to go back into the olden ways of Sir John Soane and others of its early advisers and benefactors, ere it will find itself *in situ* to carry out the ambitious arbitration programme it has laid down, so truly condemned by our correspondent.

We could say a good deal, did space suffice, in advocacy of the letter of "Triangle;" and we may, indeed, resume the topic. Let us say for the present simply this: It is absurd for architects to suppose that a builder may not understand architecture. There are very many builders (and many more parsons) who comprehend it better than too many professional architects, loth though we may be to advocate their claim to the professional vocation of the architect.

◆

SOUTH KENSINGTON MUSEUM.

A NEW reredos for the parish church, Cheddington, Buckinghamshire, has recently been placed for temporary exhibition in the North Court of the South Kensington Museum. It is executed and lent by Messrs. Powell & Sons, and consists entirely of painted tiles. The subject is divided into three panels by means of upright bands. Of these, the centre one, in which is represented the Last Supper, is the reredos proper, the side panels, filled in with diaper-work, serving as decorations for the remaining portion of the east wall of chancel. The space behind the Communion Table is filled with grey tiles, and immediately beneath the picture is the following inscription:—"In memory of mercies received at Cheddington by Lionel Dawson Damer, Rector, 1862-1870." The chief peculiarity of the work is the way in which the tiles are divided into irregular-shaped pieces, after the manner of stained glass, and the deadness or flatness of the painting. The colours employed are very low in tone, and in the sombre light of an ordinary chancel would, we imagine, have very little effect. The side-panels each bear a cross composed of blue bands. In the centre of one are the initials J.H.S., and in the other the monogram X.P.C. The letters are formed in mosaic work on a gold glass mosaic ground. The very low tone of the whole work causes the white table cloth in the altar picture to stand out in a very staring way; and the head of Judas, who is shown with dark hair, seems to be about six feet in front of the other figures. What we have most to find fault with is the difference in the quality of the art employed upon the various parts of the work. While the background and the drapery is crude and rough in the extreme—almost affectedly so—the heads and extremities are finished like miniatures. Again, from the absence of the lead lines, and the want of artistic "keeping," some of the principal figures sink into and are almost indistinguishable from the background; while others have no connection with the remaining portions of the subject, appearing to be stuck on in front of them. We are at a loss to understand what is the merit of the peculiar method of colouring which is practised in this work, and why it has been considered necessary to make the design look as if it had been put in in the usual way, and then, in consequence of being too forcible, had been partially washed out. There is an unsubstantial, waxy look about the work which is far from pleasant, and we cannot hail the process, if it is a new one, as in any way a success.

In the South Court, a magnificent chimney-piece, of Milanese mosaic work, has just been erected. The design is heavy, but the arrangement of colours and the enrichments in marble arabesque are very graceful. In the majolica staircase we notice a trial of a new mode of decoration, patented by Messrs. Minton & Co., which promises to be a great success. Little hexagonal testeræ are joined together in frames, and are then glazed and painted on in any requisite subject. They can thus be adapted to any surface laid to a perfectly true face.

◆

WORKMEN'S EXHIBITIONS: THE CAUSES OF THEIR FAILURE, AND SOME PRACTICAL SUGGESTIONS FOR THE FUTURE.

By a Working Man.

THE strictures upon the Workmen's International Exhibition contained in the BUILDING NEWS of the 29th ult. are certainly well deserved, and may be applied with equal justice to nearly all of the so-called Exhibitions which have been held in this country during the last five or six years. No surprise need be expressed at the result. As expositions of the unaided and genuine production of the individual workman, such exhibitions are decided failures, and such will be the inevitable result so long as they are carried out on the same principles as those on which they have hitherto been managed. We have had many what have been called industrial exhibitions which have been very successful financially, but utter failures in the great object for which they were originally projected. In the North, we have had so-called Industrial Exhibitions at Preston, Wakefield, Lancaster, Darwen, and Bolton—all of them successful in making money, but all of them, without exception, owed their success in a great measure to the adventitious aids of music, concerts, marionettes, fairy fountains, &c., &c. All of them were to a great extent fine art exhibitions and curiosity shops. They did some good, no doubt; but, considered as workmen's exhibitions, they were most decidedly a delusion and a sham, and might as well never been held so far as the working man is concerned, for the whole of them were mere market halls for the display of the tradesmens' and manufacturers' goods, with large advertisements displayed, crying loudly, "What d'ye lack? What d'ye lack?" In fact, each exhibition had only provided another place of business for each tradesman to display his wares in.

The idea of an international exhibition was a mistake from the first, so far as the individual workman was concerned; its promoters have, no doubt, been actuated by the purest and best motives, and they have endeavoured to carry it out to the best of their knowledge and skill, but, unfortunately, "the best laid schemes of mice and men gang aft agley," and so it has been with this project. It has degenerated into a vast advertising medium for the benefit of the employers, but says very little about the workmen. Now this, and all other so called workmen's exhibitions, worked on the same principles, carry within themselves the elements of failure, inasmuch as they allow capital to be represented instead of bonâ fide labour; and thus two causes of failure are introduced, injustice is done, jealousy is excited, and discouragement is produced. Let us look for a moment at the true aspect of the case. These exhibtions all set out with the express intention to discover and bring out the talent and skill of the individual workman, so that his work may be seen, and he encouraged to persevere and improve himself in the particular trade or profession he earns his subsistence by; or, if he is possessed of exceptional skill, or he has some particular article he has devoted time and study in producing, he has the opportunity of exhibiting it, and so becoming widely known; rewards are offered, and every inducement held out, so that he may be encouraged to exhibit and benefit himself. And what is the result? Failure. What is the proportion of individual workmen who take advantage of these liberal offers? Why, a very small percentage indeed; and this cannot be wondered at. In face of the fact that the individual workman has to compete at an immense disadvantage—that he has to stand unaided against the combined power of capital and associated skill—for it is unquestionable that there can be no comparison instituted between work produced by one man in his spare hours, after the daily labour is done by which he has to support himself, and that work which is produced in the workshop of some large firm with the combined skill and capital of the employers and workmen, having everything at hand to facilitate and perfect the work for exhibition. In these cases the conditions are so wide apart and so essentially different, and, of course, in favour of the firm, that we cannot wonder at the paucity of exhibitors of that class for whom these exhibitions are professedly established. The employers are ready enough to encourage these projects, knowing well that they will be able to find their advantage in them, either by hook or by crook (to use a homely saying). Now as regards the workman, here is, as he considers, an injustice perpetrated; and it is the height of foolishness to suppose for a moment that he is blind to the fact. He sees plainly enough that it is in the interest of capital that these exhibitions are essentially carried out, and consequently he feels no interest in them, and will not put himself out of the way to produce anything for them, knowing well that somehow or another he will be, as a personality, covered up and hid out of sight behind his employer's mantle. Then, again, the workman who does exhibit on his own account sees his modest production placed next some splendid article, perhaps of the same kind, manufactured by a large and possibly celebrated firm; and the pet child of his hand and brain—the product of weeks of toil and time snatched from the hours which should have been devoted to rest and sleep—is dwarfed and outshone by his more pretentious neighbour; and, as a natural consequence, jealous and bitter feelings are engendered—he gets discouraged and does not exhibit again.

So far as we are aware the best exhibition as a *bona fide* workmen's exhibition was the one held in Manchester in the year 1865, a notice of which will be found in the BUILDING NEWS for March of that year. The exhibition was originated by a society of grainers and decorators in that town, and was managed exclusively by working men. The conditions of the exhibition and the regulations adopted were carried out on the only true conditions on which such exhibitions should be held. The speciality of the art-workmen's exhibition (of which we are writing), as one would naturally conclude, considering its origin, was a display of specimens of house decoration, consisting of panels and doors in various styles of ornamentation, church decorations, and a large number of specimens of graining and marbling, ornamental plaster work, wood and stone carvings, gilding, enamelling, &c., wrought-iron work, and, in fact, almost everything of an ornamental character connected with the building trades, and some few of the usual miscellaneous articles having no special use; but no stalls or shops for the sale of articles, nor placards for advertising purposes usually displayed at these exhibitions. But the peculiar feature of the exhibition was the stringent regulation, which was rigidly enforced, that no article should be exhibited without the name of the workman being appended to the article exhibited, and also inserted prominently in the catalogue. There were some few articles exhibited which were the joint production of several workmen in the employ of certain firms, but in each of these cases the work was distinctly set forth (on a card appended to the article) to have been executed by John Stokes and Peter Noakes, etc., in the employment of such a firm — the names of the craftsmen always first, and the part each one took in the production of the articles, as thus :—Designed by J. Smith, carved by Thos. Evans, painted by J. Shaw, and so on—the great point the committee had in view being to bring out the name of the workman so that there could be no mistake in the matter, and in order that there might be no difficulty in anyone knowing how and where to find any individual workman. When the workman exhibited in his own name alone, his address was given. The result was that a great number of them were benefited thereby, some having offers of higher wages, others being advanced in various ways, others again receiving orders for copies of the articles exhibited, and in some cases orders were executed during the time the exhibition was open. Now here was a direct pecuniary benefit received at once by these workmen in consequence of the facilities afforded to the public for direct communication with the workmen; and, what is still more important, we have had abundant proof that the impetus given to the practice and improvement of the decorative arts in this district has been immense both in quantity and quality, inasmuch as for every five pounds spent in decoration at that time there is fifty pounds spent now. The good effect did not end there, for a spirit of emulation sprung up amongst the younger exhibitors, especially in the decorative trades, which we have good reason to know has had very important results. These facts point but to one conclusion, namely, that workmen's exhibitions, to be successful and to answer fully the ends for which they are established, must be carried out on similar principles to the one we are writing about. The workman-exhibitor must be made to feel and to see that it is for his benefit and for his advancement that the exhibition is got up, and that he will have fair play, and be placed on equal conditions with his fellow workmen; that he will not have to compete with capital; and that the employer shall be content for the time to keep in the background, leaving each workman to his own unaided efforts. He would then have some encouragement for exertion and self-denial, and would so exert himself. Only let him be once convinced that he will have a fair field and he requires no favour. Another mistake is also made in the conduct of these exhibitions in so far as the workman is almost ignored in the management. He should be consulted and have a voice in the matter; all conditions and arrangements should be submitted for his approval. As a rule, plain common sense will guide him to conclusions, and he knows best the wants and the peculiarities of his fellow-workmen, and is jealous of his rights and always ready to guard them strongly, so that it is folly to ignore him. These are apparently matters of little moment, but it is often in these little matters that success or failure lies.

As the result of considerable experience in the management of such an exhibition, and a long and intimate experience of working men, we are of opinion that all such exhibitions to be successful must be special and local—special as to trade or profession, and local as to district; and we would suggest that provision should be made in all large centres of industry for an annual exhibition of this kind, and that certain articles possessing extraordinary merit be selected from each exhibition to form a central exhibition in the metropolis, where special prizes and certificates would be given. By this means a really first-class workman would become widely known, and would have his talents and peculiar skill duly contrasted with others, and his value truly appraised, and thus would be opened out to the industrious and skilled artisan a wide field for his ambition—something to strive for—something to elevate him in the social scale and make him to respect himself, and as a natural consequence cause others to respect him. We are quite certain that until some such scheme is carried out these exhibitions will always be as they now are, huge advertising mediums.

◆

WHAT TO DO WITH THE THAMES EMBANKMENT.

ONE of the great problems of the future, we are told by the leading journal, will be the "rebuilding of our hideous metropolis," and no one can doubt that when the time shall come for the public mind to feel but half as much interest for art and architecture as for wars and tumults, it will become a matter of interest to find out at least how to *improve* London. To rebuild London would be a costly and a hard problem, and would involve a total change in the whole system as it now exists in art and architectural practice; but to improve it here and there, as opportunities offer, may be commenced at once, and without any very enormous outlay of capital or expenditure of brains. The House of Commons, by its late vote, has presented to Londoners a great chance of doing something in this direction, and we propose to offer a hint or two about it. The Thames Embankment is not to be built upon, even for the sake of Government offices or public museums, but it is to be laid out in some way or other as recreation grounds for the public, and to be made ornamental and pleasant to eye, and ear too, may be. How is this to be done? We confine ourselves to that portion of the Embankment which begins at Westminster Bridge, and ends, no one knows why, at Blackfriars Bridge, instead of going on to London Bridge, as would have seemed to be the natural termination of it. Nothing would seem to be more unfortunate than the way in which the Embankment has been contrived and arranged. Waterloo Bridge, to give but one single instance, is the best of the bridges, and terminates on either shore in a way not a little ingenious, and the problem surely was not to spoil this arrangement, but to terminate the line of the Embankment where the bridge itself ends, and bring up the wall of the Embankment flush with it, and thus to have left the whole of the bridge for a water-way, and to have constructed a new arch for the roadway of the Embankment, and so kept the river as *wide* as possible, and the architecture of the bridge, which is singularly good, complete. But we must take it as it is. What, therefore, we would suggest first, is that the awkward and solid parapet between the piers should be made to give place to an open iron railing, with a moderately broad elbow rail, so that the water of the river may be constantly in the view of those who pass along the pavement. As matters are now, no one can see the water without actually leaning over the parapet to look for it, and the way is thus reduced to an ordinary street dulness. Next, is not the pavement itself too broad for the traffic? It is a singular fact, hitherto unnoticed, that if you look at this traffic it will be found that it is but a rare chance that *two* people are found accidentally side by side and in a line with each other, so that as far as the mere traffic and crowd is concerned the pavement would be of sufficient width if but five feet wide, but say ten feet wide. Be it recollected that the whole of the picturesquenes about which there is so much talk in *old* towns is in the main due to the *narrowness* of the streets, and ways, and foot-pavements, and to the consequent thick grouping of the traffic through them. But we do not live in old or artistic days; the picturesque is confined to paper and art lecturings.

It was anticipated that a large omnibus, cab, and cart traffic would immediately commence on the opening of this new thoroughfare, but nothing of the kind seems to have taken place, probably for the simple reason that you must go out of your way for the mere purpose of driving down the Embankment roadway, and it would seem a pity that the whole of the Embankment roadway was not confined to *foot* passengers, and the quiet of the silent highway preserved. This would do away with the awkward and dismal wide road, and give the ground for trees and planting. What beauty there can be in a mere wide road like Portland-place, to give but one instance, void of traffic either of foot passengers or vehicles it would be difficult to tell. In the Thames Embankment it is seen in all its unsightly nakedness, and bareness, and uselessness.

Before we go further it is necessary to notice what has been done to the opposite side of this roadway. Walls bare enough, and some ten feet or more high, have been, as all know, built nearly from one end to the other, for the purpose of hiding and enclosing the gardens of the houses in Whitehall Gardens and of the Duke of Buccleugh's mansion, and others. Would it not be an improvement, now that no part of the ground is to be built upon, to substitute open iron railings like those in the Whitehall front of the Duke's mansion. Low, thick-leaved shrubs and ivy in the gardens would secure all the privacy that the ugly wall now does. Let us hope that the Templars will not wall in their gardens, but content themselves with what we have here suggested, or better still, if, liberally inclined, they leave their gardens open to the general way-faring public with the rest of the ground.

It should here be observed that the widest part of the Embankment, opposite the Adelphi-terrace, is four hundred feet wide, and that the average width from Somerset House to Blackfriars Bridge is some two hundred feet, so that there is ample space for a noble avenue of large trees and flower beds, or at least grass beds, from one end of the Embankment to the other; indeed, it would form, if not taken up in wide and utterly useless roadways, a small though narrow park, and nothing should be allowed to interfere with it for the mere sake of wharfage purposes, or the fancies of occupiers of private property.

Thus it will be seen that the whole of this piece of reclaimed ground from Westminster-bridge to Blackfriars, more than a mile in length and at least on an average two hundred feet wide, may be made into a pleasant garden, if not taken up by roadways and omnibus and van traffic, with a wide footway, though we would suggest not too wide, on the side of the river, and another footway next to the Whitehall mansions, the Adelphi-terrace, Somerset House, and the Temple Gardens, and—this would be our special suggestion—a noble avenue or double row of large trees on either side, from one end of the Embankment to the other; the spaces on either side between the footways and the row or rows of trees being planted with flowers, if possible, or grass. If of flowers, we might suggest that they be left to a little natural growth, and not treated in the way the unhappy flowers in Palace-yard are treated, and which it must cost the country some ten or more pounds per week to trim into artificial smartness. Flowers grow best and look best if left to nature and themselves. The unsightly Underground Railway-station, and cheap wooden piers, must of course remain, and the foolish Temple Garden archway, and the huge blocks of granite without any purpose or meaning, must all be left to fate and advertising posters, but it is to be hoped that some care will be taken of the beautiful little water gate, by Inigo Jones, now half buried at the bottom of Buckingham-street. Why not rebuild it on the edge of the Embankment, with a broad flight of steps down to the river by way of contrast to our improved modern way of work ? Through this archway you can go, but through the Temple archway before noted you cannot, for it seems to have been built only to be blocked up again. It is a beautiful bit of Renaissance architecture, and should be carefully looked to and taken down, and reconstructed stone by stone. Looking at this specimen of architecture done in days before there was or could be any architectural societies or classes for educating architects, it will hardly be said that we are improving in architecture. Contrast the Embankment architecture with it.

Let us note, by the way, another artistic matter not a little remarkable, all things considered, though it be but a small one. In the old Royal Academy days it would seem that the race of sculptors were somewhat different to what they are now, for when Sir William Chambers, the architect of Somerset House, wanted some good heads cut on key-stones, he did not get the work done by some raw apprentice, through the medium of a master contractor, but actually—it seems hardly believeable—applied at the door of the Royal Academy itself, of which he was a distinguished member—indeed, the original founder—and employed a sculptor of that body, Augustino Carlini, to do this humble work for him. All the heads on the key-stones over the doorways and windows of Somerset House are by this clever and able sculptor, Augustino Carlini ; and a specially good and characteristic one may now be seen on the key-stone of the large semi-circular arch or water-gate next the river. This fine head could hardly, without a good deal of trouble and dirty walking in river mud, be seen before the opening of the Embankment ; but now it may be easily looked at, and will be found to be a noble bit of workmanship and artistic skill. With all our schools and improved methods we had not the man among us who could "design" and cut on an ordinary key-stone of a common arch a characteristic head, so that there was nothing for it but to borrow or steal one ; and Carlini left behind him what has been deemed worth the taking, for this very head has been copied, as far as it was possible to do it, by the Thames Embankment architectural draughtsman, whoever he may have been at the moment, on the key-stone of the before mentioned Temple archway. It seems to me that great credit is due to the draughtsman who suggested this bit of borrowing from Somerset House. What would happen if a Royal Academician of our day were to be asked to carve a head on a key-stone, or other architectural member, it would be not a little dangerous to try to guess. Has the Academy *improved* since the days of Carlini ? This particular head is magnificently cut, and worth a journey down the dull, stupid Embankment to look at.

We have thus endeavoured to hint at one or two things which, among many others, would help to make this "water-way" better and pleasanter than it is at all likely to be as things now promise. To do full justice to it would take up more space than we can ask for ; but even this little may, it is hoped, help to show what may be done, and that without entailing any further expense than the simple conversion of the ground from a dull, wide, cheerless, unoccupied road into a garden, as far at least as in the present state of art seems possible.

C. B. A.

FRENCH SUBURBAN VILLAS*

THE subject which I have chosen for my paper this evening has been suggested by a very fine work entitled "Architecture Privée sous Napoleon III.," by Mons. César Daly, the eminent French architect. No branch of the architect's profession excites more interest amongst the public at large than the planning and desesigning of residences. For one person who would watch with interest the progress of a great public building, fifty would study the arrangements of a new house, and criticise minutely all its details. Everybody has a word to say here. The patron complains, after sternly limiting the cost, if he does not get everything in the way of accommodation which he has set his heart on ; the lady upbraids if her beau-ideal in the number of pantries and closets is not provided ; and even the servants take your name in vain for every smoky chimney and defective drain ; while for some of these matters the architect is as innocent as a babe unborn. Seeing that such is the case, it seriously behoves all architects who wish to achieve success in this department of our art to welcome every hint which may be derived from any source, and amongst others from a study of the houses of our continental friends.

The French houses of which I treat this evening are situated in the suburbs of Paris, and are the works of various architects. I am quite aware that the conditions which govern the designs of residences in France are different in many respects from what they are in England ; but making all due allowance for differences of climate and habit, I think there will still be much remaining that we may learn. In other branches of science and art we have been enriched to a very large extent by French example. There is scarcely anywhere a gentleman's house in this country which does not contain some article of furniture or *objet d'art* manufactured by or after a French designer, and in matters of fashion France rules the world ; but, strange to say, it has but slightly influenced English architecture. The bitter enmity which prevailed between the countries in former times no doubt explains the circumstance, as there was no disposition to receive anything favourably which emanated from a foe that we hated. That one great architect, Sir Christopher Wren, notwithstanding, derived his knowledge of the classical style from France is, I believe, a well-ascertained fact. In the present day we are happily on more cordial terms with our Gallic neighbours, and the Franch influence is beginning to be felt. We see it in our revived Gothic style, in the use of the French mansard roofs, in the revival of the Renaissance in such buildings, as the Foreign Office, and even in Liverpool in our new Exchange Buildings.

"Peace hath her victories as well as war," and it is matter of congratulation that our settled relations with the continent enable us to roam like bees over the fields of art, returning heavy laden to our industrial hive with treasure more glorious by far than any trophies of war.

Mons César Daly, in the work before us, divides his suburban villas into three classes—Première, Deuxième and Troisième.

The first example to which I wish to draw your attention is of the *premiere classe*, and is situated at St. Maur. The architect was M. Manguin. The first illustration gives a general view of the house and grounds, very beautifully delineated. The land is cleverly laid out and turned to the best account. At the left hand corner in front is the mansion, with its stables and outbuildings next to the road, and flanking a large courtyard or cour d'entrée. From this court, by a broad flight of steps, you can descend into the pleasure grounds. The portion of the ground on the right of the house is devoted to the green and hot-houses, which are ranged along the enclosure wall, having in front of them raised beds for flowers arranged symmetrically in the Italian manner. A broad walk stretches from the foot of the steps before mentioned, and is terminatedby a fountain. In the formation of the walks straight lines have been avoided as much as possible, which is particularly noticeable in the division of the kitchen garden, this being formed with a curve so as to work in with the rest. There is a good hint here for our English gardeners and architects, under whose hands the kitchen garden is generally an ugly square plot, with high brick walls, which mar the general effect of the laying out. If a symmetrical division of the garden into borders is necessary, it could be as well accomplished within a circle as a square, and in that shape would be much easier dealt with. In the illustration before us there is a stream of water flowing round the upper end of the grounds, with a smaller branch which intersects the land and makes the upper portion into an island. This is spanned by two ornamental bridges. In the centre of the island is a small chalet or summer-house. Where the walk around the island comes down to the water a balustrade is introduced, in order that views may be obtained up and down the stream. The arrangement of the house with the stables between it and the road is open to objection, as there is no separate access ; although by this means the opportunity is given for a fine architectural effect—the courtyard, with its buildings, preparing the eye for the more important structure in front. The house has rather a prison-like appearance from the road, being so completely shut in that only the upper portion can be seen.

The plan of the villa consists of an oblong block, with attached wings projecting slightly from the main body of the building. The arrangement of the apartments is simple and convenient. From the courtyard you enter into a spacious vestibule, which, continued on, forms a corridor right through to the garden entrance on the other side. On the right of this corridor are the grand and petit salons, communicating by folding doors, beyond which is the billiard-room, entered either from the large or small drawing-room. The conservatory or serre is erected at the side of the billiard-room, with which it communicates. It is a semi-oval in plan, and has a fountain placed in the centre of the curved side opposite to the billiard-room door. On each side of this door windows are placed to afford a view of the conservatory. Opening out of the grand salon, on the angle of the building, is a small boudoir contained within an octagon turret. The two salons are lit by pairs of large windows. The fireplace in the petit salon is placed under the windows. On the left of the vestibule is the grand staircase, and immediately behind the escalier de service, the remainder of the block being taken up by the salle à manger or dining-room, with an office at the angle. The garden entrance is made the most important of the two, with a spacious flight of steps leading down to the grounds, which are on a lower level than the court. Between the grand staircase and the salle à manger runs a corridor leading to the kitchen, which, with the larder and scullery, occupy the left wing of the house. There are two doors opening into the dining-room out of this corridor, so that the waiting can be accomplished with great ease. From the position of the sideboard recess it would appear that the table was intended to be placed with the head next to the window. This is contrary to what is the general practice, where the length of the table usually goes with the length of the room ; but here I think the architect is right, for first the light from the window is equally shared by all the guests at table, and ample room is left for the attendants. The proper position of the dining-room window is a point often overlooked, and I think you will agree with me as to the annoyance which we have all experienced when we have been sitting at a dinner table and have had to converse with a friend whose countenance we could not see, and whose whole appearance was like a portrait cut out of black paper, and unfortunately not always one of the best figures in the world.

The treads of the grand stairs are all curved, which not only gives additional ease in the ascent, but a beautiful play of lines. To the left of the kitchen is the house-yard with some outhouses, one of them being the lampisterie.

The stables, providing accommodation for five horses, are well-arranged. Opposite the stable door a loose box has been very well contrived, conveniently accessible to the yard without passing in front of the stalls. Above the stable there are apartments for the grooms.

The building on the right of the cour d'entree is occupied by the apartments of the concierge and a large play-room and school-room for *les enfants*. The idea of these rooms quite apart from the house is a very excellent one. Here the children, quiet and undisturbed by anything which occurs in the house, are more easily induced to give their whole attention to their studies, and in the play-room can shout or romp to their heart's content, or sallying from thence range in freedom over the beautiful grounds.

Ascending the grand staircase we arrive at the premier etage or first floor, in the centre of which is a spacious ante-chamber or landing. The two largest apartments are the chamber of the master and for guests, the small rooms in the angle turrets being dressing-rooms. The room between is the lady's boudoir, having a fireplace beneath the window, so that madame can sit before the fire or stove and have a beautiful view over the gardens. At the opposite end is a recess for the bed, to the left of which are double doors into the room, so as to keep it free from draught and private. A transverse corridor crosses the house from right to left, leading to the wings, and opening from that is the library, well placed for a studious man who, after burning the midnight oil far into the small hours, is not far off from

---

*By W. H. Picton, A.R.I.B.A. Read before the Liverpool Architectural Society.

> That heaven on earth to the weary head.

The larger bedrooms in the wings are the children's rooms.

In the floor above two large rooms are obtained for guests, and two smaller ones for servants, with dressing closets, and a large room for storing linen.

In the design of the exterior the chief pains have been bestowed upon the garden front. The style is quite eclectic in character, but thoroughly French. The architect has not shown the least anxiety to keep his work in strict accordance with any given style. Valuable hints have been derived from both the Classic and the Gothic, but he is nowhere a slave to either. I do not think the general grouping is particularly happy. The enormous roof somewhat oppresses the façade, and the turrets being so very nearly detached, and in design varying considerably from the rest, have a discordant effect, and are to the house like lukewarm friends, "neither off nor on." The detached chimney-stalks have a very weak effect, jutting up as they do from the cornice and not indicated in any way below. Amongst the many hints derived from the Gothic, it is strange the architect did not think of expressing them more distinctly. These drawbacks apart, there is very considerable merit in the design, and now for what is excellent about it. It will be seen that the wings have buttresses at the angles, starting under the string course, and carried down with one set-off only to the ground. I can see no reason whatever why our Gothic friends should monopolise this useful feature. In this case it gives stability to the corner of the wing, and also widens out the side of the building to receive the conservatory, to which it also gives a finish. Looking generally over the front, it will be seen that while the pediments over the centre and turret windows, the main cornice and round-arched windows are Italian in style, the coupled windows, the dormers in the centre of front, and the splays above the strings, and many of the mouldings, are perfectly Gothic in feeling. On the whole, I submit that the fusion has not been unsuccessful. Our French brethren display more courage than we in the architectural struggle after beauty. Why is this? It is certainly not because they do not understand the styles in their purity, for no nation in Europe has produced finer examples of representative buildings in all the known types of the art. It is not that they are careless about harmony in such matters, and do not care how heterogeneous the elements are which they heap together, providing only they create an effect; for all the details of their buildings show the most careful and scrupulous study, which will stand the test of minute examination. I suspect that there is a deeper and better cause than either of the above. I believe that their art education has been carried to such a high pitch that they have become thoroughly grounded in the principles of beauty, and having reached a higher level in the art they breathe more freely the liberal air. They refuse any longer to be tyrannised over by any style, and their art for them

> Has centre everywhere,
> Nor cares to fix itself to form.

(*To be concluded next week.*)

◆

CEMENTS.

At the last meeting of the Liverpool Architectural Society Mr. Boult stated that at the time the several cements were tested at Seacombe, as reported by him to the society on the 12th January last, Messrs. Haigh and Co. had obtained from the Liverpool Cement Company a cask of cement then lying in bulk in the works. This they had tested themselves with the following results, in comparison with the cement of Messrs. J. B. White Brothers, as reported to him in a note dated 23rd inst.:—

The test specimens were made up on January 18th, and they were tested 22nd February; they consisted of four specimens of each kind of cement, two of which, A and B, were half sand and half cement, the specimens A being air-dried and B wet; the others, C and D, were of neat cement, the first air-dried, the second wet. The specimens were cast as in the Government tests.

1A	J. B. White Brothers	torn with	538lb.
2A	Liverpool Cement Co.	„	568 „
1B	J. B. White Brothers	„	448 „
2B	Liverpool Cement Co.	„	818 „
1C	J. B. White Brothers	„	688 „
2C	Liverpool Cement Co.	„	758 „
1D	J. B. White Brothers	„	518 „
2D	Liverpool Cement Co.	„	828 „

Mr. Boult was of opinion that it was impossible to place confidence in any cement without testing every barrel.

THE KITCHEN RANGE.

(*Concluded from page* 30.)

In the concluding paragraph of our previous article we referred to the unpleasant smells that too often arise from the kitchen during the process of cooking, and proposed to trace the origin of that inconvenience, and, if possible, to point out a remedy.

The cause, then, of this annoyance is an absence of any proper regulation of the currents of air through the kitchen, or, in other words, defective ventilation. The chimney being, as we have already stated, to some extent intended as a means of ventilation, if it do not carry off all the fumes arising from the combustion of fuel, as well as, in the case of a kitchen range, all the vapours consequent upon cooking, there must be something wrong in its arrangement or form. Let us for a moment trace the air currents of a room. By an old experiment of applying a lighted paper to the edge of a room door when it is closed, or partially so, it will be found, by the direction given to the flame, that there is constantly an inward current of air at the lower part of the door, and an outward current at the top. This arises from the fact that, heated air being lighter than cold air, it rises to the top of the room, and, escaping through the cavity between the upper part of the door and the door frame, its place is supplied by a current of cooler air, which being heavier, enters from below. This lower current will be found to be much more powerful when there is a fire in the room, as then, besides supplying the air necessary to replace the escaping heated atmosphere, a considerable additional quantity is required to support the combustion of fuel in the grate, and the air thus supplied escapes up the chimney; whereas when there is no fire there is a downward current in the chimney itself, which assists in supplying fresh air to the room. Bearing this principle of ventilation in mind, let us now trace the course of those vapours, or smells, which at times escape from the kitchen into the other apartments whilst cooking is going on. In the first place were the ventilation of the kitchen perfect, all these fumes would escape up the chimney; but, in the absence of proper arrangements for this purpose, a portion of them escape into the kitchen, in the first place, and, rising with the heated vapours of the apartment, ascend until they fill the entire space between the ceiling and the top of the doors; and it will be found by practical test that whilst the lower part of the room is almost free from smell, the upper stratum of air is strongly impregnated with the odours arising from cooking. If the top of the door leading into the outer air be above that of the inner door, a certain portion of these will escape into the atmosphere; but, as both doors are usually of the same height, they will by preference escape over the inner door, and so get into the other part of the house. This arises from the fact that the house itself acts as a huge chimney to the lower apartments, and the outer current of air is consequently stronger in the direction of the house than towards the atmosphere. The fumes, therefore, which are unable to ascend the chimney will escape into the house, and be carried by the ascending atmosphere into the passages and rooms on the lower floors above. It may, however, not unreasonably be asked why under these conditions the smell is not strongest in the top storey rather than on the floor immediately above the kitchen? A moment's reflection will explain this. If the heated air thus impregnated retained its initial temperature, we should undoubtedly find it most conspicuous on the topmost floor; but meeting, as it rises, with cooler currents, it not only becomes condensed, and so freed to a certain extent from its impurities, but by the admixture of a larger quantity of air the impurities become diluted; and, ultimately, as the air rises, all sense of their existence becomes lost.

There can be no doubt that the inconvenience to which we are referring exists to a much greater extent where the American kitcheners are employed than with an open range, in consequence of the draughts of combustion being conveyed up close flues; whilst a small register only furnishes the means of escape for the other vapours, and through which the draught is not sufficiently strong to carry them off. For this reason close-topped ranges are more likely to be offensive than those with open fires; but for convenience of cooking, the former are certainly more advantageous, in consequence of the whole top of the range being a hot-plate. A combination of the close and open range, such as is now being fitted to the Grosvenor Mansions, in Westminster, and which are manufactured by Messrs. Herring and Son, of Chertsey, whilst they possess, to some extent, the convenience of the hot-plate, do not obstruct the proper current of draught up the chimney, and are, therefore, not to the same extent liable to the defects of which we have been speaking.

In making these remarks we desire especially to avoid giving any opinion decidedly adverse to close ranges. We have known them to act admirably, and to be free from the causes of complaint to which we are referring. From what we have already said it will be understood that the smell of cooking in a house arises, not generally in consequence of a defective stove, but from a faulty chimney, or the bad setting of a stove.

It would be impossible to lay down any golden rule for the avoidance of the inconvenience, as each case must depend upon local circumstances. Every builder or professed chimney doctor will have his own remedy, consisting, probably, of some patent in which he is personally interested; but whilst all may be good under certain circumstances, each one will probably be found to fail in nine cases out of ten. The only scientific way of getting over the difficulty is either to increase the draught of the chimney through the orifice up which the fumes of cooking should ascend; or else to draw those fumes off from the upper stratum of air in the kitchen, as near the ceiling as may be convenient, either by means of a ventilator in the chimney, or by one communicating with the outer air from some part in the wall, as high as possible above the top of the kitchen door.

A simple yet effectual way of accomplishing the former object is by contracting the orifice of the register where necessary, and decreasing the open space round the front of the range, thus inducing a stronger current from the kitchen up the flue. This is quite practicable with a kitchen range, although it could not be applied as a remedy for any evils attendant on the fireplace of a sitting or sleeping apartment, because one of the consequences would necessarily be the shutting out of a portion of the heat of the fire from the room. This, in the case of a kitchen, would be no immediate drawback, as the fire would still be equally available for culinary purposes; but, under circumstances where the fire is merely required to heat an apartment, any contraction of the chimney-piece front would tend immediately to detract from the very benefits the fire was designed to contribute. Taking off the heated stratum of air from the upper surface of the room in the manner above suggested is but a modification of Dr. Arnott's system of ventilation, which is too well known to require any dissertation here.—F. C. Danvers, in the *Food Journal.*

BUILDING NEWS SKETCH BOOK.

XXXVIII.—ANCIENT CROSS.

I FORWARD you per book post an etching of a very ancient cross in Llantwit Major Church, Glamorganshire, for the Building News Sketch Book. The cross is 6ft. high, and the diameter of the top 2ft. 6in. The carved ornaments on it speak for themselves, being of the same description as the beautiful twisted knots to be found on the Irish monuments of the same date (800 to 1100). I do not think any drawing of this most interesting stone has as yet been published, and certainly no photos have been taken. J. Romilly Allen.

THE THEORY AND PRACTICE OF MODERN HOUSE PAINTING AND DECORATION.

By AN EXPERIENCED WORKMAN.

PREPARATORY PROCESSES.

(Continued from page 101.)

THE first coat of paint on walls should in almost all cases be mixed with white lead and linseed oil alone, in the proportion of about four pounds of lead to one pint of oil. The exceptions to the above rule are rare, and consist of such works as are finished very smoothly and trowelled to a fine hard surface with Keene's or other fine cement. In these cases the surface is hard, and of course nonabsorbent, like glass, and if the ordinary oil paint is laid on it, it remains upon the surface and does not sink into the body of the cement, as it does on common plaster work or Portland or Roman cement; and unless great care is used the paint will skin over, and thus make a rough face, and one very liable to be scratched off with the slightest touch. Consequently, the first coat of paint on these hard cements should be mixed about half-and-half, that is in equal portions of linseed oil and turpentine, with about five pounds of lead to a pint of thinners, and in laying the paint on the work it should be rubbed as bare as possible. It will be found much better and safer to go to the extra trouble of giving the work one or two extra coats of paint than to lay on too much stuff at one time; and two days at the least should always intervene between each coat, except in finishing with flatting or dead colour, which should be done on the next day, as we thereby get a key in the coat of oil paint which will bind the flat colour, which has very little binding power in itself. If too much paint is laid on the work scarcely ever gets hard, and cannot be rubbed down, but skins over the surface and of course keeps soft underneath. The second coat should be mixed with two-thirds oil to one of turpentine; third coat, two-thirds turpentine to one of oil. Thus we get a firm, hard, and tenacious body of paint, without any tendency to reeve, crinkle, soften, or peel. The ordinary plastered walls have a porosity and power of absorption quite different to the cement we have been describing, and consequently the paint used for the first coat on such walls should be oil colour exclusively, and may be mixed in the following proportions, namely, one pint of linseed oil to four pounds of white lead, and stained with a little Indian red or Venetian red. We prefer the first or primary coat, either on walls or woodwork, stained red—in the first place because warm red tints cover better, and sooner bring the work to one uniform tint than either cold or even umber tints; and secondly, because whatever tint of colour the work may afterwards be finished, the red in the first coat warms and mellows all the subsequent coats; and here we may note the fact that, in painting, almost all colours are improved by a groundwork of red or reddish tone of colour. Blacks, blues, greens, and yellows are improved in tone treated in this manner. It will, of course, be understood that there must afterwards be a sufficient body of colour, either green or blue, to cover the red, and that the red must be in strength or depth of tone proportioned to the strength of the tints of the finishing colour. For instance, if we want a rich black we should paint the ground with Indian red or chocolate colour; one coat of drop black would cover and suffice, and we should thus get a better black than if the ground colour had been lead colour, which is the general mode. But in painting a wall or door which had to be finished in light tints of party colours, we should only stain the first coat of priming of sufficient depth to answer the end in view, namely, to warm and mellow the successive coats of paint, for it is a fact that if we paint a groundwork of any strong colour, and afterwards paint the same over with four, five, or six coats of light tints of colour, that all these coats of paint will be influenced more or less by the first ground colour, and the finishing tint will partake, to some extent, of its tone. We find in practice that if common outside window sashes, which are being repainted, dirty and black as they are generally in our huge towns—if they are to be painted with two coats of white, that the second or finishing coat will cover better and be much whiter if the first coat is stained with red. The red seems to have a power of destroying or killing the black dirt which no other colour possesses. Now if these sashes are painted with two coats of white, the first of it, being without red, is of a dirty leaden hue, which affects the second coat. It will be said that the same effect may be gained in finishing the work in tints if we add red to the last coat. It is true that the colour may be modified in this manner, but not without sacrificing the purity of some tints; whereas in the former case we obtain the warmth and purity of tone as well.

In giving the proportions of white lead to oil in the mixing of paints for various purposes, both here and in other parts of our subject, it must be thoroughly understood that, although they will be found to be strictly correct, being established by years of experience, the proportions named only refer to the best white lead and oil; for, as we have before pointed out in our article on white leads, white lead is so much adulterated that it would not be possible to lay down any laws or proportions which would be applicable to all, and, in any case, some little latitude must be allowed, because even the best leads differ in solidity according to age, new lead not requiring so much oil in mixing it into paint as old lead does, its density being considerably less. When the colour is mixed, it should be properly strained through either fine muslin or finely-perforated metal strainers. These latter do not answer the purpose as well as they should, because they will, of course, allow all particles of grit to pass through the perforations which are not too large, also particles of lead. In straining the paint, we have two objects in view, namely, to thoroughly mix and amalgamate the lead and oil, and, secondly, to intercept all grit, skins, and foreign matter which may be in the colour; and we find in practice that this is best effected either by using two or three folds of fine muslin or a strainer made of the finest gauze wire. Much will, of course, depend on the fineness or coarseness of the lead or colours used. Much of the common lead, and many of the common colours, are so coarsely ground, and have so much sand and other abominations mixed with them, to make them weigh heavy, that it is impossible to make smooth work with them, however carefully the paint is strained. But with good and well-ground pigments, carefully mixed and strained, there will be no difficulty in getting up smooth work. Great care should also be taken with brushes to see that they are perfectly clean and free from nitts, dirt, and grit. The keeping of brushes clean and in working order is one of the greatest difficulties the painter has to contend with; men are careless, and don't take the trouble to prevent the brushes getting foul. Many plans are tried with varying success. While brushes are being used daily on a job, they take no harm in being placed in water in a clean kettle or tub, and, with sufficient water to just cover the bristles, they will be in working order next morning. In using brushes, whether for paint or varnish, there are several conditions requisite to preserve them in good working order, the principal of which are, first, care in working, so that the brush shall work evenly, and with the ends of the hair uniform in length and square. This can only be accomplished by using the brush lightly, without much pressure. A common fault with many painters is to exert too much pressure on the sides of the brush when working, thus wearing it away on two sides and leaving it hollow in the middle, making it an impossibility to lay off the work without shewing the marks or streaks of the brush. In fact, a poor workman will give himself a large amount of extra trouble, or, rather, harder work than there is any necessity for, and not do the work half as easily or half as well as the good workman. This fault is the cause of that streakiness we so often see in painted work. The second qualification for a good brush is cleanliness, which can only be obtained and kept by carefulness in working. A good workman will have his brushes clean in the handle, and free from paint on the stock and on the bridleing, and will take care that the paint is well scraped from the roots of the hair before he puts it away when done done with it for a time; but the careless workman allows the paint to accumulate at the roots of his bristles, and on the stock and handle of the brush, where it dries, and when he is working with it the dry paint breaks up by the motion produced in working, and so gets on to his work, fills it with nitts, and, of course, makes bad and rough work. He is liable also, with a brush in this state, to get the lead on his hands and under his nails, thus bringing on colic, &c., &c.—for it may be set down as a rule that the workman who is careless and dirty in the use of his tools will be not over cleanly or careful of his person. On the other hand, a good and careful workman may use the paint brush a whole day without soiling his hands—which fact, in many cases, just makes the difference between health and disease amongst house-painters. The next, and, in fact, one of the principal requisites for preserving a brush in working order is the indispensable necessity of having some means of keeping them right when put away for a time. Ordinarily, this is done by simply placing the brushes in the brush-tub, with very little care or attention, and if they should not be required for use for any considerable time the bristles become bent and turned up at the points, and often twisted or warped in their whole length, and so become useless; or the tub may not have enough water in it to cover the roots of the hair, and the consequence is the paint on them becomes dry, and the brush becomes foul and nitty; or there may be too much water in the tub, not only covering the bristles but the stock also; and the result is that the stock swells, the wrapping becomes rotten, and the brush bursts, and thus it is ruined. A good plan to adopt with brushes which are constantly in use is to have a zinc cistern made, of any convenient size, according to the number of brushes required to be kept in it. An oblong is the best form; its depth should be not less than 10in. The lid must be made of zinc, strengthened with strong bars of zinc, and perforated with oval and round holes just of sufficient size to allow one brush to be placed in each, so that it shall be held without falling through. The cistern may then always be kept full of water without danger of injuring the brushes. The lid should be so arranged that the brushes shall enter the water only so far as just to cover the bristles; thus suspended they will not touch the bottom of the cistern, and so will escape injury. Brushes which are used for varnishing require to be treated in a different manner to the common paint brush, inasmuch as water is totally unsuited to keep them in, because water causes the varnish remaining in the brush after being used to become fat—that is, thick and leathery—and turns it white, and it becomes nitty. Varnish brushes require considerably more care bestowed upon them than they get, as a rule; and the best varnish may be, and, in fact, often is, spoiled by using a foul or dirty brush.

A writer in a recent number of the "Scientific American" recommends varnish brushes to be kept in slow-drying varnish when out of use. This plan may answer if the said brushes are being used day after day consecutively, which is rarely the case except in toy-shops and japanner's workshops; but its fallacy, as applied to the house-painters' varnish brushes, will be evident at once if we consider that the varnish brushes have to be put away a week or a fortnight at a time, and sometimes much longer; and even the slowest of slow-drying varnishes will skin over and dry long before that time, and consequently the brushes get foul. If the brushes are to be kept in this manner we prefer that linseed oil should be used instead of slow-drying varnish. The brush should be cleared from the varnish as much as possible, either by rubbing out or scraping over a palette knife. The brush should then be placed in a tin can, with a zinc or wooden lid, of a similar construction to the one described above; but we prefer them only of sufficient capacity to contain one or two brushes, being much easier kept clean and the oil removed. The oil should fill the tin, and the brush should be suspended so that the hairs do not touch the bottom. These various plans are generally adopted for convenience and to save time; but we have invariably found in practice that decidedly the best plan to preserve a varnish brush clean and free from nitts is to wash it out—that is if it is not going to be used for a few days. We recommend that it be first rinsed out with turps, and then thoroughly washed out with soap and hot water. With a little care and attention every particle of varnish may be removed from the roots of the bristles, and the brush put away perfectly clean and ready for the next job. There is no other method known to us (after a large experience) whereby varnish brushes can be kept free from nitts and in first-rate working order.

(*To be continued.*)

ART EDUCATION IN THE UNITED KINGDOM.

THE following extract of a minute issued on August 6th gives the relative position in successful work of the Schools of Art in the kingdom. There are now above one hundred schools of art, exclusive of drawing classes, in various institutions, which are taught by teachers holding lower certificates than those of Art Masters.

The minute of 3rd January, 1868, offered prizes to the head Masters of Schools of Art in which the general amount of work, as tested by examinations, considered with reference to the number of students under instruction, was most satisfactory. In accordance with the principles laid down by the minute of the 19th February, 1868, and having regard to the number or students taught in each school, the following prizes have been awarded by the Lords of the Committee of Council on Education:—

	£
J. S. Rawle, Nottingham	50
Louisa Gann, Bloomsbury	40
W. H. Sounes, Sheffield	40
J. Sparkes, Lambeth	40
W. J. Muckley, Manchester	30
C. D. Hodder, Edinbro' (male)	30
E. R. Taylor, Lincoln	30
D. W. Raimbach, Birmingham	30
W. C. Way, Newcastle-on-Tyne	30
John Parker, S. Thomas' Charterhouse	20
R. Greenlees, Glasgow	20
Walter Smith, Bradford	29
W. H. Stopford, Halifax	20
Edwin Lyne, Dublin	20
G. Stewart, West London	20
H. Lees, Carlisle	20
Susan A. Asworth, Edinburgh (female)	20
J. P. Bacon, Stoke on-Trent	20
J. C. Thompson, Warrington	20
J. Carter, Hanley	10
Walter Smith, Leeds (South parade)	10
W. L. Casey, S. Martin's, Long Acre	10
J. N. Smith, Bristol	10
G. Theaker, Burslem	10
J. Menzies, Aberdeen	10
R. Cochrane, Norwich	10
J. Bently, Birkenhead	10
J. Anderson, Coventry	10
Walter Smith, Wakefield	10
J. E. Goepel, Frome	10
J. P. Bacon, Newcastle-under-Lyne	10
D. Jones, Dudley	10
H. Woolner, Coalbrookdale	10
A. Macdonald, Oxford	10
S. Thomas, Sunderland	10
C. Swinstead, North London	10
J. S. Dorning, Great Yarmouth	10
S. F. Mills, Spitalfields	10
W. Stewart, Paisley	10

◆

We hear that Sir W. A. Fraser, Bart., M.A., F.A.S., late M.P. for Barnstaple, is a candidate for the vacant office of the Chairman of the Board of Works.

ROYAL ARCHÆOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND AT LEICESTER.

(*Concluded from page* 95.)

ON Thursday week upwards of sixty of the members and friends of the society started in a special train for Ashby-de-la-Zouch, Tamworth, and Tutbury. At Ashby, the first halting place, the party visited the interesting and picturesque ruins of the castle. Mr. Parker, although it was his first sight of the ruins, explained the different buildings remaining, and after some observations from Mr. Clarke, the party walked on to the old church, where Mr. Bloxam drew their attention to a very remarkable effigy in the north aisle. It is a monument of a person evidently of high rank, and there is not, he said, another like it in England. The figure wears the "S.S." collar, and from other evidences the deceased had doubtless been on a pilgrimage. They next inspected the monuments in the chancel erected to the memory of Theophilus, Earl of Huntingdon, and his Countess. Mr. Bloxam pointed out the barb or gorget covering the chin of the Countess, which denoted that she was a widow. It was more complete than any he had ever seen. The Mayor's converazione was held in the evening at the Town Museum.

On Friday, a meeting of the members of the Institute was held at an early hour, for the purpose of deciding some routine matter, and among other things of fixing the place of meeting for next year. This meeting was private, but the place was not finally fixed. The Historical Section afterwards met, under the presidency of Lord Talbot de Malahide. Three papers were set down for discussion. 1. Paper by the Rev. Dr. Margoliouth: "Gleanings of Historic Anglo-Hebrew from the Annals of Ancient Mercia." 2. Professor Lewis: "Remarks on Coins recently found at Sutton, near Woodbridge." 3. Mr. H. F. Holt: "The Parliament of Henry V. at Leicester in 1414." There was a fourth paper by Mr. Lee Warner, on Wycliffe (who was a Leicestershire worthy), and in the short discussion which followed, Mr. Bloxam declared that all the portraits that had been published of Wycliffe were imaginary, and that a patchwork garment shown as his gown was of a later date; moreover, that Wycliffe, who is always represented with a beard, was always clean shaven. The meeting then broke up, and at half-past two a large party proceeded in carriages to Kirby Muxloe Castle. The edifice is built of brick, with sandstone facings, mullions, copings, &c. It is generally supposed that it was built about the year 1475, by Sir William, afterwards Lord, Hastings. It was formerly encompassed by a moat, enclosing an oblong space of nearly two acres. A gateway, flanked by two semi-octagonal towers, conducted into the court-yards, and tradition reports that the castle was for some time a place of refuge for Jane Shore. On each side of the entrance passage were vaulted rooms, formerly used by the porters. Mr. Bloxam, in the absence of Mr. Clarke, F.S.A., explained the character of the ruins, remarking that it was forty years since he had visited the locality. One of the towers which now alone remains on the south-west side, was then examined. It contained three principal rooms, one over the other, each supplied with a fire-place and chimney. The lower one, perhaps, served as a hall or guard room for the servants, the one over it as the lord's hall or principal living-room, and the uppermost as his "solar" or sleeping-room. The party, at the invitation of Mr. J. Bennett, one of the Town Councillors of the borough, who has a residence at Kirby, visited his house, and afterwards returned to Leicester, where a soirée was held in the evening at the Town Museum.

On Saturday, a somewhat lengthened excursion was made. The members left Leicester at nine a.m. for Groby Castle, Bradgate Park, Ulverscroft Priory, Woodhouse Chapel, Beaumanor, and Gracedieu, returning thence (from Coalville station) by railway train due at Leicester at 7.40 p.m. The whole of the journey out was performed by road, and the Rev. E. Hill, who undertook the conductorship of the excursion, planned the arrangements admirably. The journey altogether was over 30 miles through the most picturesque portion of the county of Leicester. The first halt was made at Groby Castle and Mound, where Mr. Bloxam made some pertinent remarks respecting the mound there situated. An old volume in the Temporary Museum at Leicester, bearing the title of "The Description of Leicestershire, containing manners of antiquitye, historye, armorye, and geniology. By William Burton, Esq." (1622), says of Groby:—"There was an ancient castle whose wals (as I finde in old record) were beaten down by commandment of King H. 2. There had been also a very faire and ancient chappell, but all those goodly buildings are now ruinated and gone." Mr. Bloxam said an old tradition asserted that a subterranean passage once led from this mound to Ulverscroft Priory and Leicester Abbey.

From Groby Castle the party proceeded to Bradgate Park. The ruins were inspected, and also the domestic chapel. Mr. Bloxam gave some interesting particulars respecting the exterior of the building, remarking that it was formerly a seat of the Lords Grey of Groby. It was built in the early part of the sixteenth century by Thomas, Lord Grey, second Marquis of Dorset, and was occupied by his descendants as their chief seat until the beginning of the last century, when it was destroyed by fire. The ruins at present consist of two towers, one square and the other an irregular polygon. On the north side was the great hall, the remains of which are now luxuriantly mantled with ivy. The foundations of the buildings are still visible, and at the south-east corner are the remains of an octagonal tower. The area near to the chapel was formerly the garden. The chapel was next visited, and the monument erected to Lord Henry Grey and his lady was examined with great interest. Mr. Bloxam observed, in connection with this building, that it undoubtedly formed part of the original chapel to the hall, but about twenty years ago it was used as a farm shed. The build- was now, however, taken care of. Great interest was attached to the locality, owing to its having been the birth-place of the celebrated and unfortunate Lady Jane Grey, who spent here the earliest and happiest of her years. Mr. Reeves, the park-keeper, pointed out two oak trees supposed to have been planted by Lady Jane Grey and Lord Dudley; also a mulberry tree supposed to have been planted by the former.

The next place visited was Ulverscroft Priory. Here every facility was offered by the tenant, Mr. Thirlby, to view the ruins. A very interesting description of the old Priory was given by Mr. Bloxam. The Priory, it was stated, was founded in 1130 by Robert Bossu, Earl of Leicester, for Eremites of the Order of St. Augustine. It was refounded by Henry VIII. in 1537, but was dissolved in 1539. A very minute inspection was made of the church, tower, and priory house, and a curious tile, taken from the church, was also pointed out in Mr. Thirlby's kitchen, representing one of the signs of the Zodiac—the sun in Aries.

Woodhouse Chapel was next examined. Mr. J. Gough Nicholls gave an explanation of one or two painted windows in the chapel. He stated that the original building was founded in 1338, and that it was rebuilt in the time of Henry VI., when the windows were filled in with the beautiful stained glass, mainly coats of arms, by Lord Henry Beaumont. The party then proceeded to Beaumanor, arriving about two o'clock. They were received by Mr. and Mrs. Herrick and Miss Herrick, and hospitably entertained. After an entire examination of the house and grounds, the party drove through Loughborough to Gracedieu. The chapel was inspected, also the ruins, which were fully described by Mr. J. Thompson. This ancient Priory was founded by Roisi de Verdon, widow of Lord Verdon, in 1240. Coalville was then made for, whence the excursionists left by special train for Leicester, which they reached shortly before eight o'clock.

On Monday morning the Historical Section met in the lecture room at the Town Museum. Mr. Carthew occupied the chair, and in the absence of the Rev. Assheton Pownall, the Rev. J. Spittal read a paper prepared by the former gentleman, on the recent find of Roman coin in Leicestershire. Two other papers were down for reading—one by the Rev. J. H. Hill on the Earls of Rutland, and another on a portion of the history of his parish by a Leicestershire rector, but neither the papers nor the authors being forthcoming, the limited audience present were conducted over the Museum by Mr. Weatherhead, the curator, who gave some interesting details in reference to the ancient coins to be found in that institution. A party of about thirty in number started by the 12.50 train for Melton Mowbray, where the beauties of the church were pointed out by Mr Wing. The church, dedicated to S. Mary, is spacious lofty building, with a handsome tower, partly in the Early English style. At the west end is a very peculiar entrance porch, with an elegant doorway, having two niches on each side and two ornamental windows. The church was built most probably in the year 1350, and was considerably improved in the reign of Queen Elizabeth by the addition of the clerestory, the continuous lights and moulding of which have a fine effect. The east window, which was given by the late Robert Day, of Wymondham, represents the parables of the Good Samaritan, the Prodigal Son, the Sower, the Pearl, the Pharisees, and the Publican, &c. The present restoration of the church is progressing most satisfactorily. The excursionists then went to Oakham by road, carriages and pairs having been provided for them. They visited the very handsome Gothic church of All Saints', and the ancient castle, which is supposed to have been built soon after the Norman Conquest by Wakelin de Ferrars. After a pleasant day the party returned to Leicester by the 5.40 train. In the evening a *conversazione* was held in the temporary museum. There was but a spare attendance.

The concluding meeting took place on Tuesday in the Town-hall, a hearty vote of thanks being tendered to the Mayor of Leicester, the Leicestershire Architectural Society, the Literary and Philosophical Society, the Freemasons of the Provinces, and the Archæological Society for their reception of the Institution and the facilities placed at their disposal by the use of the Guildhall, the Town Library, and the Lecture Room, and to all those who had hospitably entertained the members of the Institute.

The temporary museum, the contents of which were admitably arranged by Mr. Tucker, deserves notice. Among them, the visitors' attention was principally diverted to the silver *repousse* plate, exhibited by Mr. Nevinson; the knight's armour, the thumb-ring found in the castle, &c., by Mr. Kelly; a curious little Roman tripod, by Mr. North; the Corporation seal and the silver badge of the town waits (temp. Eliz.); a very large Saxon fibula, by Sir F. G. Fowke, Mr. Freen, and Mr. Knight, joint lords of the manor in which it was discovered; the large collection of books upon local history, from the town library, and others lent by Mr. Thompson, Mr. Sarcen, &c.; the detail drawings of the very ancient Wyggeston Hospital, by Mr. Paget—which singular edifice, it is to be hoped, may be preserved intact, or otherwise at least saved from utter destruction by its careful transformation into some useful public building as has been well sketched by that admirable architect Mr. Goddard; the Saxon swords and other articles from Melton Mowbray, by Mr. Fetch, and which we are pleased to hear will be left behind in the town museum; the extensive series of portraits lent by the Earl of Denbigh, Mr. W. Perry Herrick, the Corporation, and Mrs. Cooke; the extensive collection of Roman relics and the enamels shown by Mr. Goddard; the smaller silver mace formerly belonging to the town, but purchased by Mr. Nevinson when the outburst of anti-corporate temper in 1836 led the local political reformers to dispose of plate, pictures, official robes, and gilded baubles, and which, after now thirty-four years of separation, has reposed once more beside the grand mace which to-day is again the symbol of power for the chief magistrate, having been repurchased by subscription some two or three years ago. The most remarkable of Mediæval articles is the embroidered vestment of English work not later than A.D. 1300, lent by the fathers of the Dominican convent in Leicester. The charters from the town chest were remarkable, and include one by King John, in A.D. 1199.

◆

ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETIES.

Kent Archæological Society.—The annual meeting of this society was held at Sittingbourne on the 3rd inst. The business meeting of the society was held in the Literary Institute; Earl Amherst, the president, in the chair. Amongst those present were the Rev. J. B. Moore, Sir Walter Stirling, Lord Fitzwalter, Sir John Croft, Major General Jenkyns, General M'Queen, Revs. J. Pearman, W. A. Scott Robertson, F. E. Tuke, J. S. Hoare, Mr. Godfrey Faussett (hon. sec.), Dr. Farr, Dr. Grayling, Dr. T. B. Smith, Mr. Hallett, Mr. G. W. Norman, Mr. G. Lambert, F.S.A., Mr. J. Allen, Mr. Sampson Seaton, &c. Earl Amherst, in moving the adoption of the annual report, said that its tone was highly satisfactory, and the society was in a flourishing condition. They had a large sum of money in hand, but it would be considerably larger if all the members would pay their subscriptions more punctually. The report was adopted, several new members were elected, and a vote of thanks to the noble president concluded the proceedings. The members then paid a visit to Sittingbourne Church, under the guidance of the Rev. W. A. Scott Robertson, who gave a history of the sacred edifice, which is dedicated to St. Michael. It is a handsome structure, consisting of nave, two chancels, and two side aisles, with a tower at the west end. It was burnt down, with the exception of the bare walls, in 1762, by accident, and at that time most of the ancient monuments were destroyed. In rebuilding the church many of the gravestones were removed from the graves over which they lay to other parts of the church, and some even were used to make the pavement complete. One peculiarity of the edifice is that the south chancel belongs to the Chilton estate, and the north transept to the Bayford estate. The members then proceeded to inspect numerous old churches and remains of fortifications in the district. Bayford Castle, of which only a ditch and an artificial mound are now to be seen, was built by Alfred the Great about the year 893 to serve as a check to the incursions of the Danes, who had made a raid under Hasting, a powerful chief, on the neighbouring country, and who were entrenched at Kemsley Downe, near Milton. The entrenchments are of an oval shape, and were originally 70 or 80 yards in circumference, with a moat about 20ft. wide, part of which is now filled up. Tong Castle was next visited, about the name of which there is a curious legend. Vortigern, one of the kings of Britain, being highly pleased with the conduct of a well-known Saxon chief, Hengist, in a battle with the the Picts at Stamford, in Lincolnshire, was desirous of rewarding him for his bravery, and at his request granted him as much land as an ox-hide would encompass. The tradition as to the founding of Carthage by Queen Dido was re-enacted, and Hengist cut the hide into small thongs, and enclosed within them a sufficient plot of ground to build a castle, which he accordingly erected, and named *Thwang ceastre*, or Thong Castle, whence the parish afterwards took its name. Tong Church is remarkable for the conglomeration which it presents of various styles of architecture. On the south side of the edifice the nave is divided from a side aisle by circular arches, one of the pillars, and one only, being a handsome Norman column with claw-like ornaments at its base. The north side is spanned by several pointed arches. There are evidences of Early English architecture, but the square tower is Norman. Murston Church was built in the reign of Henry II., at the time when the Early English style was taking the place of Norman architecture. It is dedicated to All Saints, and in the western wall there is a very Early English flat-head trefoil window. On the rood screen is a monumental brass in perfect preservation, bearing the date of 1488, and the name of John Everist, who was the lord of the manor at that time. There is also an ancient piscina and some few carved corbels of antique patterns. Near this church some years ago a great deal of Roman pottery was discovered. In an adjacent farmyard stands an old barn which was once the rectory of the parish. A curious inscription on the tithe barn near the present rectory was examined with much curiosity. It is as follows:—"*Si natura negat facit indignatio versum.* The barne which stood where this now stands was burnt down by the rebels' hands in December, 1659. The barne which stands where tother stood By Richard Tray is now made good in July, 1662. All things you burne or overturne but build up nought; pray tell is this the fire of zeale or hell? Yet you do all by the Spirit's call as you pretend, but pray what spirit ist (is it) a bad on (one) I dare say." The party returned shortly before five o'clock and dined at the Corn Exchange, Earl Amherst in the chair.

Surrey Archæological Society.—The annual excursion of the Surrey Archæological Society took place on Thursday week. Meeting at Redhill Junction, the party first proceeded in vehicles to Nutfield Church, under the guidance of Mr. E. V. Austin, the hon. secretary of the society. The church, which contains nothing earlier than thirteenth century work, was described by Mr. Heales, F.S.A. The chancel has lately been restored. The company next proceeded to Bletchingley church, where an elaborate paper was read by Mr. G. W. G. Leveson-Gower, F.S.A., who minutely traced the history of the church, and at the close of his paper congratulated those present on meeting in a church where restoration had been carried out so satisfactorily. The work of restoration was entrusted to Mr. Pearson, who is now architect to the fabric of Lincoln Cathedral. On leaving Bletchingley, the excursionists proceeded to the "Cardinal's Cap," on White Hill, near Caterham. Mr. J. W. Flower, F.G.S., here read an interesting paper, in which he said that the "Cardinal's Cap" was an ancient British fort. Returning towards Bletchingley, the party visited the grounds of Arthur's Seat, the residence of Mr. W. Long, and after partaking of refreshments, proceeded to visit a half-timbered house in Brewer street, Bletchingley. It is now used as a farm house, but is supposed to have formerly served as the gatehouse which led to the old Manor House, destroyed by the Earl of Peterborough in 1638. Mr. Charles Baily explained the chief features of the building, which is in excellent repair, and a good specimen of the period (*temp.* Henry VI) The quantity of oak used in its construction led them to believe that this portion of the country was one vast forest of oak. The next move was to Pendell Court, the seat of Mr. George Macleay, by whom the company were entertained at luncheon. This, supplemented by the usual speech making, brought the proceedings to a close.

◆

PARLIAMENTARY NOTES.

Science Examinations.—Mr. Dixon on Thursday week asked the Vice-President of the Committee of Council on Education whether he had received numerous complaints from the teachers regarding the science examinations in May last, and whether those complaints had just foundation. —Mr. Forster said the complaints of the teachers related to two subjects, practical geometry and building construction, but those complaints had no fixed basis. He did not believe the examination papers were too difficult; on the contrary, the standard of marks was lowered this year. He found, however, that the pupils were prepared for a purely drawing examination rather than a scientific one. At the same time the teachers were enabled to obtain payment for their pupils under the branch of drawing instruction.

Removal of Temple-bar.—In answer to Mr. Lambert, Mr. Alderman Lawrence stated that Mr. Street, in accordance with the recommendation of tha Royal Commissioners, had provided in his original plan of the New Law Courts for the removal of Temple-bar and the widening of Fleet-street at that point, and for the erection of a new bridge with a wide archway, to form a communication between the Temple and the Law Courts. The city of London was prepared to accept that plan. The removal of Temple-bar without widening Fleet street would not faciliate the traffic, and there would still be room only for the passing of two vehicles at a time.

The Wellington Monument.—Mr. B. Hope on Tuesday asked whether the Government would undertake that no further steps should be taken in the matter of the Wellington monument until the matter could be fully discussed in Parliament, and an opportunity given to the artist to make the explanations which were not included in the papers laid before Parliament?—Mr. Ayrton said that on April 14 last, Mr. Penrose, the architect, was informed that an inquiry would be held into the proceedings with reference to the monument of the Duke of Wellington, and, therefore, ample opportunity was afforded for explanation. On April 21, a letter was also addressed to Mr. Stevens, the sculptor, to the same effect, and he also had ample opportunity of offering explanation, but none was given by either of these gentlemen that was at all satisfactory to the gentlemen who made the inquiry. It was not until July 20 last that Mr. Penrose was informed that his services as superintending architect would be dispensed with; and Mr. Stevens was informed on the same day that his contract was considered to be annulled in consequence of his default. Mr. Penrose on this occasion gave no explanation, while Mr. Stevens wrote a letter which appeared to him (Mr. Ayrton) to make his position much worse than before. The consequence was that it had become necessary to hand the papers over to the solicitor of the department of works with instructions to take immediate measures for enforcing the rights of the Crown. If the hon. member desired to discuss the question next year, he could not be in a better position than by having the questions between the Crown and these gentlemen decided by a Court of Justice.—Mr. Newdegate, on Wednesday, in calling the attention of the House to the correspondence relating to the Wellington monument in S. Paul's Cathedral, said that the greatest interest pertained to everything that related to the late Duke of Wellington, and he thought it was unpardonable that correspondence on this subject, which had been ordered to be printed by the House on the 22nd July, had not been presented before yesterday. The memorial submitted to the prime minister by the sculptor was not fully set forth in the documents submitted to the House, and he hoped that inasmuch as legal proceedings were pending between Mr. Penrose and the Commissioners of Works, the House, following its usual practice, would offer no opinion on the merits of the case; and he should move that the correspondence laid on the table of the house did not furnish sufficient data to enable the House to express any opinion on the subject. As it appeared to him, Mr. Penrose had erected a full-sized model of the monument at a cost of £2,000, which he had paid for out of his own pocket, and had not reduced the value of the monument by that sum, as he was entitled to. The hon. gentleman concluded by moving that the correspondence, with respect to the Wellington monument, as laid upon the table of this House, does not furnish sufficient data whereby this House can form an opinion upon the circumstances of the case.—Mr. Ayrton observed that the hon. gentleman was entirely in error in his statement of facts with respect to Mr. Stevens, which would be seen at once on reference to the papers which had been laid upon the table. (Laughter.) He had no objection to lay upon the table all the correspondence, including the memorial of Mr. Stevens. Mr. Newdegate expressed himself satisfied with the proposed course, and withdrew his motion.

Indian Engineering College.—Mr. Plunket asked the Under-Secretary of State for India whether it was the intention of her Majesty's Government to establish an "engineering college" for the preparation of candidates seeking employment in the Indian Public Works Department; and if so, whether it was the intention of her Majesty's Government to abandon or modify the present system of competitive examination for appointments in that department; and whether it was intended to abolish the system of competitive examinations for the Forests' Service in India.—Mr. G. Duff replied that it was the intention of the Government to establish an engineering college for the Indian service, to be entered by competitive examination. It was not intended to abolish competitive examination for the Forests' Service in India.

LEGAL INTELLIGENCE.

House Agents and their Commission.—A case of an interesting nature to house agents came on for hearing on Monday, at Leeds County Court The plaintiff, Wm. Coo, estate agent, Corn Exchange, Leeds, was represented by Mr. A. C. Granger, and he sued an owner of property named Thomas Bedford, who was represented by Mr. Turner (Richardson and Turner), for £11 10s., which he alleged to be due as commission on the sale of a house in New Leeds. In the early part of this year the defendant instructed the plaintiff to advertise a villa in Leopold-street for sale. The advertisement was inserted in the plaintiff's property list, and on the 13th of April a gentleman named Allen, belonging to London, called and saw the villa, but he found it two large for his requirements. Therefore, according to the plaintiff, Mr. Allen was introduced by him to the defendant, who had some other houses on hand, and subsequently a sale of Mr. Bedford's own house was effected at the price of £700. The contention of the plaintiff was that as Mr. Allen was unknown to the defendant, he would not have heard of the residence had not the plaintiff introduced him, and further that the agency of the plaintiff in the matter was a perfectly understood thing. In proof of agency, a conversation was relied upon, in which the defendant said to plaintiff, when the negociations had been entered upon, "I am glad you have called Mr. Coo; I was just going on to your office;" and in which the plaintiff before leaving said to defendant, "It will make no difference to you or me whether I sell Mr. Allen the villa or your house," the remark having reference to the commission. Mr. Bedford, however, denied any contract with the plaintiff, and also gave a denial to the alleged conversation. Mr. Allen was called, and from his evidence it appeared that it was he himself and not the plaintiff who suggested that they should look at the other houses of the defendant. Coo had wanted him to examine the houses of another proprietor, and they had simply come to Mr. Bedford in an accidental manner. The Judge considered that the suggestion as to the purchase came from Mr. Allen himself, and he really did not see that in point of law the plaintiff could demand commission.—Verdict for defendant.

Sewage Percolation.—The Brighton Water Company *v.* Marshall was a case heard recently in the Vice-Chancellor's Court. It appeared that the defendant, proprietor of the "Walmer Castle" inn, Park-road, Brighton, had sunk a cesspool on his premises contiguous to a large tunnel made by plaintiffs from their reservoir on the Race Hill to a point in Park-road, such tunnel serving as a conduit for their main pipe. The plaintiffs, finding the sewage matter percolated through the chalk from the cesspool into the tunnel, filed a bill for an injunction against defendant. Some doubts were raised as to the nature and quality of the title of the company to the tunnel in question, which underlies the well-known Kemp estate; and, in order not to prejudice any question on this point hereafter, a decree was taken by consent for an injunction against the defendant with costs, the company waiving all claims to damages.

The Blackburn Sewage.—The *Preston Guardian* has reason to believe that the action which has been for some time pending between Sir W. H. Feilden, Bart., of Feniscowles, and the Corporation of Blackburn, in which the former claims £20,000 as damages in consequence of the pollution of the River Darwen by means of the town sewage, will be set down for hearing at the ensuing assizes to be held at Liverpool.

Commission on Building.—At the Westminster County Court, on Friday last (before F. Bayley, Esq.), the case of Haddon *v.* Morton and Co. (Limted), was heard. The action was brought by the plaintiff, Mr. John Cooke Haddon, civil engineer, Besborough-gardens, Pimlico, against defendants, extensive builders and contractors, Kennington-road, to recover the sum of £22 odd, commission on work obtained through him for them, on which it was agreed that he was to be paid 2½ per cent. The liability was denied. Plaintiff stated that in the early part of July, 1866, he was spoken to by an architect named Davis, who holds a commission as Captain in the 19th Surrey Rifle Volunteers, as to his knowledge of a builder who could erect a military shed for the corps at Kennington, when he mentioned the names of the defendants, whom he introduced to Col. Brown, and heard a contract entered into for the work required to be done for £758. He waited till the shed was completed, when on applying for payment of his commission he was told that it was not through him the work had been done, as the contract made with him had fallen through, and a fresh one entered into for the sum of £903 by the intervention of Captain Davis. He therefore, now, with the thorough knowledge that he was the first that mentioned the names of the defendants who were consequently ultimately employed to erect the shed, took these proceedings. Captain Davis corroborated plaintiff as to his mentioning defendants whom he himself also knew, but no arrangements were made with him, as they would not undertake to do the work for the sum first named. Witness subsequently suggested alterations and improvements, the defendants tendering to make them, whereupon their contract was accepted and the work done. His Honour observed that plaintiff's claim could not be established, as the terms on his introduction were not entertained, but a new contract entered into; and his decision must therefore be against him. Judgment for defendants, they not asking for costs.

◆

London and County Banking Company.—The half-yearly general meeting of the shareholders of the London and County Banking Company was held on Thursday week at the City Terminus Hall, Cannon-street. The report, which was unanimously adopted, showed the net profits for half-year to be £83,285 6s. 11d., which added to the balance of £8,895 17s. 5d., produced a total of £92,181 4s, 4d. Out of this amount the directors declared a dividend of 6 per cent., with a bonus of 2½ per cent., for the half-year, absorbing £85,000, and leaving £7,181 4s. 4d. to be carried forward to profit and loss new account.

Building Intelligence.

CHURCHES AND CHAPELS.

Aberfoyle.—A parish church at Aberfoyle has been opened for public worship. The style of architecture is Gothic. The church is of cruciform structure, with steep roof, which is surmounted at one end by a neat belfry, and ornamented at the other by a cross. Near the east end is an arched porch, floored with tile in the mosaic form, and at the other end, under the cross, is situated the vestry. The church is seated for 200 persons. The architect was Mr. Honeyman, Regent-street, Glasgow. The church which the present structure supersedes was built in 1744.

Ashby (near Brigg, Lincolnshire).—A new Wesleyan chapel is in course of erection here. The building is of red brick, with Ancaster stone dressings. In the front is a five-light geometrical traceried window, with a smaller one-light window on either side of it. The side and back windows are plain lancets, with stained glass in the heads. The two entrance doorways are sheltered with moulded and carved gablets, carried on detached columns, with carved capitals. The pews are of varnished deal, seating 200 people; the pulpit and communion are of pitch pine. The cost, including warming and fencing, will be about £400. Mr. J. R. James, of Hull, is the architect, and Mr. J. H. Whitehead, of Caistor, is the contractor.

Bampton.—The ancient parish church of Bampton was re-opened on Wednesday week, after complete restoration. The building is cruciform, and is dedicated to S. Mary; its architecture is of a mixed character, although it is plain that the Norman style prevails. It has a nave, with north and south aisles, two transepts, and a chancel. In 1867 the chancel was begun, and in about twelve months' time the work was completed, at a cost of about £600, service meanwhile being held in the nave; the contract was taken by Mr. Luker. The north and south transepts were next begun, the contracts for the work being taken by Mr. Lord, Mr. Plaster, and Mr. J. Williams, about £400 being the entire cost, and these were completed in June of last year. Further funds having been raised, the restoration of the nave was begun, Mr. Bartlett, of Witney, having obtained the contract at £800. Mr. M. Bartlett, of Witney, was the local architect, and the works have been carried on under the superintendence of Mr. Wakeford.

Bridlington.—On Tuesday week the foundation stone of S. Anne's Church, Bridlington was laid. The church consists of nave, with one aisle divided by five bays on the south side, two vestries, and apsidal chancel with ambulatory. The material to be used is moulded brick, red, yellow, and white, and the style adopted by the architect (Mr. C. T. Newstead, of York) is Early Pointed. The fittings of the interior will be of pitch-pine, and accommodation is provided for 550 persons. There will be a considerable quantity of grill work, and it is proposed to decorate the interior walls with paintings on tiles.

Calverley.—The ancient parish church of Calverley has undergone restoration under the superintendence of Messrs. T. H. and F. Healey, architects, Bradford, and on Wednesday week was reopened for public worship. With little exception, the former style of the church has been rigidly adhered to, and as the renovation has been effected tastefully, the edifice now presents a very neat, commodious, and comfortable appearance. The cost will probably not be less than £3,600. The chancel and north and south aisles have been rebuilt; the octagonal pillars and the roof of the nave restored; new roofs have been put to the chancel and aisles; there are new seats of oak; and the old pulpit has been re-adapted for use. Messrs. Tomlinson and Son, of Leeds, were the contractors.

Clee.—On Wednesday week the corner-stones were laid of a Primitive Methodist chapel in New Clee (Yorks). The new chapel is to hold 600 persons, and will be erected by Messrs. Riggall and Hewin, Mr. Joseph Benton attending to the woodwork. The architect is Mr. Wright, of Hull. The cost is to be £1,500.

Coatham.—The foundation stone of the new chapel of the Coatham Convalescent Home was laid on Tuesday week by Mr. Thomas Hague Cook, of Mirfield. The plan for the chapel has been prepared by Mr. G. E. Street. There will be seats for 180 persons, and the estimated cost is £1,400.

Dodleston.—S. Mary's Church, Dodleston, Cheshire, was reopened after restoration on Saturday last. The whole of the old church, with the exception of the tower, has been rebuilt, but portions of the old work, such as doors and windows, have been re-used in the new edifice. It will accommodate 300, rather more than the capabilities of the old church. The architecture is Perpendicular Gothic, and the building now consists of nave and north aisle, with an organ-chamber and vestry on its north side. The porch is of half-timbered oak. The whole of the interior is of chiselled ashlar, and the fittings are of varnished pitch pine. The chancel has carved stalls and encaustic tile floors. The chancel, ceiling, and east wall have been decorated by Heaton, Butler, and Bayne, of London. The cost has been about £3,000, exclusive of the boundary wall and lych-gate. The architect is Mr. Douglas, of Chester, Mr. Henry Wigginer, of Chester, being the builder; and the joiner's work having been executed by Mr. John Harrison.

Framlingham.—The Independent chapel has been re-opened after considerable alterations and improvements. Erected about 40 years ago, it has of late years shown signs of material and gradual settlement in various parts. Recently a committee was formed to take steps to ascertain the cause of these settlements, and to apply a remedy. They consulted Mr. Sugden, architect, of Leek, who at once caused an examination of the foundations to be made, and discovered that the walls, instead of being carried down to a sufficient depth to secure a hard, unyielding bed (which was found at no great depth below the footings), had been set upon plates of timber, carried all round the building, the width of the walls, on a soft subsoil; and these plates were so completely decayed as to be scarcely distinguishable in some instances from the soil on which they were placed. On the advice of the architect the walls have been entirely under-built down to a hard gravel bed, thus rendering the structure safe from further settlement. The interior has also been entirely re-arranged and re-seated, and other improvements have been effected which have given a completeness and substantiality to the building which it never possessed before.

Gunby St. Peters.—On the 21st ult. the Bishop of Lincoln opened a new church in the village Gunby S. Peters, which is near the Burgh station of the East Lincolnshire Railway. The old church, a plain whitewashed building, was erected about 1634. This, after having undergone several alterations (not improvements), was rapidly falling into decay, when, in 1868, Mr. Fowler, of Louth, furnished a design, which has been carried out at a cost of about £1,300.

Halifax.—Last week the new and handsome church of S. Mary, Halifax, was consecrated by the Bishop of Ripon. The architects are Messrs. Mallinson and Barber, of Halifax, and the style is Geometrical Decorated, the principal entrance being through the tower at the west end of the north aisle. The principal decoration has been bestowed upon the chancel arch, the large five-light east window, and the reredos, which is of Caen stone. The total cost of the building will be about £8,000.

Hull.—On Saturday last the foundation-stone of a new Danish church, dedicated to S. Nicolai, was laid at Hull. The cost is estimated at £2,500. The church is designed in the Gothic style, and is to accommodate about 250 persons. The body of the building is 28ft. by 55ft.; there is an apse for the altar and vestry, and accommodation is provided for a reading room 30ft. by 16ft. Mr. W. Botterill, of Parliament-stret, Hull, is the architect, and Messrs. Lison and Wilkinson the contractors.

Liverpool.—The new church of S. Stephens', Byrom-street, Liverpool, has been completed. The building, which has been erected in accordance with plans prepared by Messrs. Culshaw and Summers, of Rumford-place, will seat about 750 persons, and has cost £8,300, irrespective of the price of the land. The contractors for the entire works were Messrs. Grindrod and Hargreaves, of Hope-street. The walls of the church are of brick, with yellow Stoughton stone dressings, and nearly all the carved and ornamental work has been expended upon the front of the structure, which is composed of Yorkshire shoddies and Stoughton stone.

Pickering.—On Tuesday week the Archbishop of York consecrated a new church at Newton-upon-Rawcliffe, five miles from Pickering. The church is a plain structure, and built substantially of stone procured in the immediate neighbourhood. The church is dedicated to S. John the Evangelist, and will seat 150 persons. The style adopted for the church by the architect (Mr. Tarn, of London) is Early English, and the cost has been £800. The roof is open-timbered and high pitched, and the seats are open.

St. David's Cathedral.—The committee appointed to superintend the restoration of S. David's Cathedral have determined at once to commence the rebuilding of the roof and ceilings of the nave and aisles, postponing for the present the restoration of the pavement of the nave, also the west end and porch. The repairs of the transepts and chapter-house have also to be postponed. The receipts up to this time have been £22,000. The actual expenditure is £18,500, leaving a balance in favour of the fund of £3,500. Mr. Gilbert Scott estimates that about £8,000 more will be required to complete the restorations, and efforts are now being made to raise that sum.

Sunderland.—Last week a newly-erected district church in connection with the parish church of Monkwearmouth, dedicated to S. Bede, was consecrated by the Bishop of Durham. The new church, a neat stone building with a handsome interior, stands at the end of the Newcastle-road at Monkwearmouth, and was built by Mr. Scott, of Sunderland, from the designs of Mr. Pritchett, architect. It is designed to accommodate about 600 persons.

Thixendale.—A very beautiful new church, designed by Mr. George Edmund Street, A R.A., has been built at Thixendale, on the Wolds, East Riding, at the sole cost of Sir Tatton Sykes, Bart. The edifice has been ready for consecration for fully six months, but from certain causes disappointment has resulted on the two occasions fixed for the ceremony. It was first announced that the consecration was to take place on the 4th April last, and every preparation was made, when on the previous Saturday only it was stated the Archbishop would not consecrate, in consequence of some informality in the deed of conveyance. Rumour at that time said that all was not right in the chancel. The ceremony was again fixed for Friday last, but early in the week it was intimated to the founder that unless the super altar was altered the consecration could not take place. To this, it is understood, Sir Tatton declined to accede, and another postponement takes place *sine die*. The super altar is a slab of real marble, supported at each end by jambs of Caen stone. The oak communion table is partly overhung by this slab, which is walled into the the base of an elaborately panelled reredos of Caen stone and Devonian marble, of which it is really a part. This, it is alleged, was shown in the drawings of the church which were submitted to the Archbishop. In this difficulty the architect has been sent for, Sir Tatton refusing to permit any alteration without his sanction, and the church remains still useless.

Wettenhall.—S. David's Church, Wettenhall, was consecrated on Wednesday week. The style is a simple Gothic type of the 13th century. The building, which is cruciform in shape, and consists of nave, transepts, and porch, is of brick, with a little of the red stone from the old building, and white Kelsall stone sparingly introduced. The dimensions are—from east to west, 67ft. 5in.; from the north to the south walls of the transepts, 36ft. 5in.; the nave being 14ft. 4in. wide. The sittings will accommodate 200 persons. Mr. James Redford, A.R.I.B.A., 43, Lower Moseley-street, Manchester, and Mr. J. A. Davenport, of Over, near Winsford, are the architects; and Mr. Peter Hodgkinson, of Booth-lane Head, Sandbach, the builder.

BUILDINGS.

Ipswich.—The new Ipswich Lunatic Asylum has just been completed. The building was begun in May, 1868, and has cost about £19,500, accommodation being provided for 180 patients. Mr. Ribbans, the town surveyor, was the architect, and prepared his plans in accordance with the rules of the Lunacy Commissioners. The building is of red brick externally, and was erected by Mr. Gibbons, builder, Mr. Catchpole being the clerk of the works.

Leek.—A new boys' school and lecture-room is about to be erected in connection with S. Luke's Church, and the existing school buildings will afterwards be used for girls and infants only. The total outlay will be about £1,200. Mr. Sugden, of Leek, is the architect.

Salford.—On Saturday afternoon the foundation stone of a new Sunday school in connection with the Chapel-street Congregational Chapel, Salford, was laid. The building is to accommodate between seven and eight hundred scholars. Internally it will consist of a general schoolroom and class-rooms, above which there will be a gallery, composed of three tiers of seats. The structure, which will be a plain but substantial one, is to be built of brick, with stone dressings. The total estimated cost is £2,300. Mr. Henry Fuller, of Manchester, is the architect, and Mr. William Brown, of Salford, the builder.

Wheelock, Cheshire.—New National Schools, comprising separate boys', girls', and infants' schools, are about to be erected here, on land given for the purpose by Sir Charles Shackerly, Bart., who is also a principal contributor to the erection of the schools. The plans have been approved by the Privy Council. Mr. Sugden, of Leek, is the architect.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

To Our Readers.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office not later than 5 p.m on Thursday.

Received.—C. B. A., C. S., G. H. R., H. S., E. H. W. S., J. S. G., J. H. D., J. N., Capt. S., Rev. E. B., W. W., Enquirer, J. M., J. R. D., T. and Son, W. and Co., S. and Co., S. and G., J. M. B., G. Bros.

J. R. G.—We do not insert quack advertisements.
J. M.—About a month hence.
T. C. E.—Drawings returned.
J. M.—Other fish to fry.
G. A. Noble.—Do not know the address.
J. L. T.—Send the drawings.
W. T.—Have patience.

Correspondence.

ARCHITECTS AND BUILDERS.

(*To the Editor of the* Building News.)

Sir,—In last week's Building News you give a letter from an architect against builders or joiners making plans, &c. Will you allow something to be said on the other side by one who has passed from the bench to be shop-foreman, to outdoor and managing foreman under a contractor, and has had an opportunity to learn some of the ins and outs of contracts?

Your correspondent says that architects do not want builders to give low tenders; that they do all they can to advise their clients not to accept the lowest. Well, is this fair? May it not be asked what principle should be acted upon, or what can be the object of calling for tenders, unless it be to obtain the advantages of competition? Is it right to put builders to the trouble of getting up estimates, at the same time that the architect or his client may have a particular man that he means shall have the job? Again, what chance is there for a man to rise from an inferior to a higher position except by tendering; is he to buy the favour of some architect in large practice? Again, is it not a fact that many builders, like architects, know comparatively nothing of the business, who, when they have to get up a tender, instead of being able to go through the plans and extract quantities, and price them, employ an architect to do it for them? I am aware there are many excellent gentlemen who are above this; I have met with several; but it is quite true that in this matter the right man can evade specifications and trick architect and client.

It is said that many of the builders are scamps, and are not to be trusted; but whose fault is it where an architect is employed? Any honest builder would prefer an architect between him and the client; but if an architect takes the money from his client ought he not fully to discharge his duties? Why do they call upon builders to give securities for carrying out contracts when they are only to receive a given percentage as the work proceeds, and that upon the certificates of the architect? It seems much more reasonable that the architect should give the security than that the other should do so. I have known in what is called a select competition, that only one man out of the number competing was able to give the security, and he allowed to name the competitors. Of course he had the job. In reference to builders making their own plans, is it not true that there are many builders who get little jobs to do, and will go at once and employ an architect to give them plans and details for no other purpose but to get in his debt, when the architect knows he shall never get paid until he puts some job into their hands, when of course the client has to suffer to make up for this.

Again, are all architects up to the duties they undertake? Many of them understand the principles of proportion and arrangement on paper, as well as being able to draw up plans and specifications, and for these duties are probably well qualified, but they know very little of the practical part. They do not know whether a stone is on its natural bed, or when it is face-bedded; nor do they know the difference between Memel, Dantzic, or Swedish timber when sawn out into scantlings; the same by deals—Christiana, or Wyburg; or of the difference of the several kinds, which makes a great difference in the quality of work. One builder may buy his deals at £15 or £16 the 100; another may give £24; yet they all come under the term yellow timber. The consequences are that one builder, having done work under the architect knows the way to work it; indeed, it has appeared to me many times that the architect was determined not to see when he goes to the job, so long as the details of elevation and ornamentation are something near the mark.

The tone of your correspondent's letter is very suggestive of despotic assumptions that will not be endorsed by any liberal-minded architect. Is it to be received in this nineteenth century that because a man started life as a joiner or in any other branch of the building trade, he is to be kept down, whatever his ability may be, in order that he may not intrude within the assumed domain of a privileged class?

I give an instance that occurred to me some short time since. A man applied to me to build a house for him, asking me to give plans and specifications as to what I was going to do for the estimated cost. I suggested that he should employ an architect, naming one. He said, at first, that he did not think it worth while, as he had confidence in me, but he would think about it. He consulted some of his friends. They recommended another architect, who got tenders for the job, allowing me to tender. My tender being a few pounds too high I lost the job. Of course, I do not know what passed between architect and client, but I was told afterwards that it was my own fault; if I had not made the suggestion he would not have thought of it, and would have been very well satisfied with my estimate. Yet, forsooth, because I happen to be able to do such a thing—acquired in the time which many spend in the pothouse—your amiable correspondent would not allow me to tender, but would prefer giving the advantage to those incapables whose chief ability is employed to trick architect and client.—I am, Sir, &c.,

Fair Field and no Favour.

WESLEYAN CHAPELS IN LONDON.

Sir,—In your issue of last week you say that it is intended to build ten new Wesleyan Chapels in London, at a cost of £20,000. The fact is, that as the Metropolitan Building Fund resources are just about exhausted, Sir Francis Lycett offered £50,000 for new chapels to be built during the next seven years, with the hope that country congregations, who have not done much hitherto, would come forward with another £50,000.

During the last seven or eight years chapels, costing upwards of £100,000, have been built in the metropolis; but for reliable figures I would refer to published reports, and to the *Watchman* of the last two or three weeks, which contains full accounts of the proceedings at the different Conference Committees.—I am, Sir, &c.,

W. J. Heaton.

Southport, August 8, 1870.

ASSISTANT SURVEYORSHIP.

Sir,—It would be interesting to many of your readers could they learn through the medium of your pages the nature of the questions put at the recent examination for the Assistant Surveyorship at the Office of Works, as they could by this means become acquainted with the requirements other than correct spelling considered necessary by the Civil Service Commissioners for candidates for such a post. The publication of such examination papers would also be of great service to the younger members of the profession, by affording them an opportunity of testing their own knowledge.—I am, Sir, &c. A. G.

QUESTIONS.

[1911.]—STUCCO WASH.—Will any person be so kind as to give particulars and quantities of ingredients which may be depended upon to make a tolerably permanent stone colour outside wash?—T. P.

REPLIES.

[1905.]—CALCULATING EARTHWORK.—"Young Engineer" cannot obtain the *true* cubic contents of the cutting he mentions, either by the method of *mean heights* or *mean area*—the former, in the case he mentions, giving an error *in defect* of 5,599 cubic yards, and the latter an error *in excess* of 11,193 cubic yards, as compared with the true contents, = 120,981 cubic yards. The *prismoidal formula*, used by Sir J. Macneill in calculating the tables published by him some twenty, or more, years ago, gives the true and mathematically correct contents (there are a variety of other approximative methods, more or less correct); it is this:—The sum of the areas of each end added to four times the mid-area, multiplied by the length in feet, and this product divided by 6 = the contents in cubic yards. For instance in the case given:—

11 height.
1·5 slope.
55
11
16·5
30 base.
46·5
11 height.
511·5 = area of lesser end.

35 = height.
1·5 slope.
17·5
35
52·5
80 base.
82·5
35 height.
4125
2475
2887·5 = area of greater end.

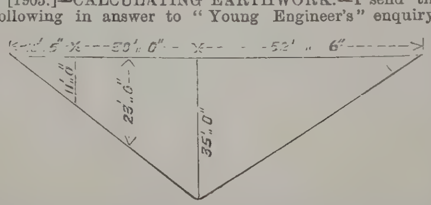
11 } heights.
35 }
2)46
23 mean height.
1·5 slope.
115
23
34·5
30 base.
64·5
23 mean height.
1935
1290
1483·5 mean area.
4
5934·0 = 4 times mean area.
2887·5 = area of greatest end.
551·5 = of lesser end.
6)9333·0 sum of areas.
3)1555·5 sum of 6.
9) 518·5
57·61
2100 length in feet.
576100
11522
120·981 contents in cubic yards.

By using Macneill's tables, the above result is obtained with much less figuring; for example:—

57·61 table number, page 104.
2100 length in feet.
3761,00
11522
120,981 cubic yards.

H. S. P.

[1905.]—CALCULATING EARTHWORK.—I send the following in answer to "Young Engineer's" enquiry.



Assuming that two right-angled triangles are equal to a rectangle, we shall find the question stand thus:—

Area of the greater end =
82ft. 6in. × 35ft. 0in. = 2887ft. 6in.
Area of the lesser end =
46ft. 6in. × 11ft. 0in. = 511ft. 6in.
2)3399ft. 0in.
1699ft. 6in. mean area of [section.

Then, as the cutting is 700 yards long = 2100ft.
∴ 2100ft. × 1699ft. 6in. = 3568950 ÷ 27 = 132183⅓ c. yds.
or thus:—
2100 × 30 × 23 = 1449000 cubic feet in cutting.
2100 × (52 — 6 × 35 — 0) + (16 — 6 × 11) ÷ 2
= 1837ft. 6in. + 181 — 6 = 2019 ÷ 2 = 1009ft. 6in.
= mean area of slopes.
then,
2100 × 1009ft. 6in. = 2119950 cubic feet in two slopes,
and 1449000 cubic feet in cutting,
= 3568950 ÷ 27 = 132183⅓ cubic yards, as before.

G. Ray.

◆

LAND AND BUILDING SOCIETIES.

Improved Industrial Dwellings Company (Limited).—The fourteenth half-yearly meeting of this company takes place to-day (Friday) at the Mansion-house. The report to be presented to the meeting states that the whole of the share capital, viz., £125,000, has been subscribed, and a further sum of £125,000 will be borrowed at 4 per cent. from the Public Works Loan Commissioners; which will represent a total capital of £250,000. Of the loans, viz., £52,000, already arranged, sums amounting to £40,000 have been received, and the balance will be immediately taken up. The negotiations for the loan of £17,000 on the Ebury-street and Ebury-square estates are still pending. £33,562 18s. 4d. has been expended during the half-year on works in progress, and in completing the purchase of the Bethnal green estate, &c., and the total expenditure on capital account is now £167,903. The gross rents received during the half-year amount to £6,878 0s. 7d., interest allowed by bankers and other items amounting to £68 15s. 8d., making a total income £6,946 16s. 3d. The total expenditure, including the contributions to the reserve accounts amounts to £3,169 4s. 8d., leaving a profit of £3,777 11s. 7d., which is equal to £6 0s. 10½d. per cent. per annum on the subscribed capital. The Directors recommend that, as heretofore, a dividend at the rate of 5 per cent. per annum be paid. With the exception of "Nelson" buildings at Greenwich, the general position of the company's estate must be regarded as highly satisfactory. At Greenwich, notwithstanding a further reduction of rents has been made, there has been no improvement in the occupation, the great depression of trade in that locality still existing. The Directors have completed the purchase of the Bethnal-green estate. The five blocks of buildings at Ebury-street and Queen-street, Pimlico, are approaching completion; but will not be ready for occupation before October next. At Ebury-square, however, the dwellings are in a more forward state, and will probably be occupied before the end of August. Fifty-four dwellings on the Bethnal-green Estate have been completed, and 13 additional blocks of dwellings, which will afford accommodation for 130 families or about 500 persons, are now in course of erection on the same principle. The company has now nine blocks of buildings, viz.:—1. King's-cross road; 2. Greenwich; 3. High-street, Wapping; 4. Old St. Pancras road; 5. City-road; 6. Redcross street, Southwark; 7. Britannia-street, King's-cross-road, 8. Willow-street, Finsbury; 9. Bethnal-green. The whole number of tenements is 0,347, of which 390 are three-roomed and 623 are two-roomed. The report complains of the assessments having been unjustly increased under the operation of the "Valuation of Property (Metropolis) Act," and intend to take every necessary step to prevent such assessments being confirmed. The offices of the Company will, for the future, be at No. 34, Finsbury-circus.

◆

WATER SUPPLY AND SANITARY MATTERS.

Brighton.—The first meeting of the Brighton Sewers Board was held on Monday afternoon. The Board has been constituted pursuant to the 13th section of the Brighton Intercepting and Outfall Sewers Act. It was resolved that Mr. Hawkshaw be invited to confer with the Board as early as possible with respect to the preparation of drawings and a specification, upon which a contract may be taken for carrying out the undertaking.

Chorley.—The Chorley Improvement Commissioners have received a letter from the Medical Department of the Privy Council directing them to put in force the powers conferred by the Nuisance Removal Act of 1855 with reference to the bad construction of dwellings.

Hull Water Supply.—The Hull Town Council have authorised the Water Works Committee to instruct Mr. Dale, the Engineer to the Corporation, to prepare plans, specifications, and detailed drawings of the scheme suggested by him for increasing the water supply, and to advertise for tenders for executing the works.

The Disposal of Town Refuse.—Mr. Conyers Morrell, the inventor of Morrell's ash closet and apparatus, recently read a paper at the Liverpool Free Library "On the Health of Towns, and the Treatment and Disposal of Town Refuse." Mr. Morrell argued that the only easily practicable and economical system of utilising human excreta was by deodorisation with fire ashes. The water-closet system he condemned on account of the waste of water, and its deteriorating effect upon the manurial properties of the excreta. It was now out of the question to turn sewage into rivers, and in many instances it was impracticable to utilize the sewage on land. The ash closet system would add to the value of the manure which resulted, and do away with the necessity of costly sewage works. At Liverpool the discharge from the sewers' mouths was at least 37,500,000 tons annually, requiring at least 7,000 acres to cleanse it.

PRESTON.—The following resolutions with respect to the extension of the water supply of Preston have been agreed to by the Water Committee of the Town Council:—"That the tenders of Mr. Robert Carlisle for executing the three contracts for constructing the conduit for obtaining the supply of water from the Langden and Hareden Brooks, according to the plans and specification, for the following sums, viz., Contract No. 1, £10,427 6s.; No. 2, £9,975 5s. 4d.; No. 3, £8,631 16s, be accepted upon his giving satisfactory securities for the performance of the several contracts;" and "that a 3in. main be laid from the main in Fishergate-hill through Christian-road to Charles-street, the estimated cost being £94." The first sod of the new works was cut at Chipping on Thursday week.

WIRKSWORTH.—Mr. Hawksley, of Nottingham, is engaged in making a survey of the waterworks, with the view of obtaining a better supply. His report is expected in a few days.

◆

STATUES, MEMORIALS, ETC.

BIRMINGHAM.—The statue of Rowland Hill, which has been executed by Mr. Peter Hollins, is, by consent of the Birmingham Exchange Committee, to be placed in a bay of the Exchange building until the new Post-office is completed. The statue is 10ft. 9in. in height, including the pedestal, upon which there is a bas-relief of a sick girl in bed receiving a letter from a postman.

THE LATE EARL OF CARLISLE.—A statue of the late Earl of Carlisle, erected by the people of Cumberland to commemorate the public services and personal worth of the deceased nobleman, was unveiled at Brampton on Tuesday. The statue is of bronze, by Foley, and stands about 8ft. high, on a pedestal of the same height, it being, to a certain extent, a replica of the Dublin memorial in Phœnix-park. The figure is attired in the robes and insignia of the Order of the Garter. His Lordship is represented in a standing position, with one hand resting on a book placed on an octagonal dwarf column. The mantle is so thrown back as to display the entire front of the figure, and is partly held back by the left hand. The front of the pedestal bears the following inscription:—"Erected by the people of Cumberland to commemorate the public services and personal worth of George William Frederick Howard, seventh Earl of Carlisle, K.G., born April 18, 1802, died December 5, 1864." The cost of the statue and the pedestal will be about £800.

Our Office Table.

TOTAL DESTRUCTION OF THE NEW COVERED MARKET AT PRESTON.—On Saturday morning, about half-past seven o'clock, the new covered market in course of erection in the Orchard, at Preston, and which was fast approaching completion, fell with a tremendous crash, startling the whole neighbourhood. The design of the building was that of a very large open shed, constructed entirely of iron, with twelve or fourteen clustered pillars on each side, and four at each end, with longitudinal girders and principals for the roof. Preparations were making at the very moment of the accident to prevent the vibration of the roof, to which the casualty is attributed. The contract for the erection of the market was let in January last to Mr. Joseph Clayton, ironfounder, of Preston, for £6,070. The other tenders were—D. Howarth, Rochdale, £7,070 12s.; E. Bickerstaffe, Preston; £7,100; W. Allsop, Preston, £6,687; J. Tildesley, Bilston, £9,480; Preston Waggon and Iron Company, £7,468; Messrs. Newton and Co., Accrington, £6,850.

WHITWORTH SCHOLARSHIPS.—The practical examination of workmen and students for these scholarships has been fixed by Sir Joseph Whitworth to take place at his works at Manchester on the 30th August and 1st September next.

ROYAL INSURANCE COMPANY.—With the annual report of the Royal Insurance Company, presented at the general meeting of shareholders on the 5th inst., the directors submit the results of the quinquennial valuation of the life business made by Mr. Samuel Brown (late president of the Institute of Actuaries) in the form proposed in the schedules of the Life Assurance Companies' Act, passed in the session of Parliament just closed. Mr. Brown, in his report, states that the table used for the valuation has been Mr. Griffith Davies' Equitable Experience, and the rate of interest assumed has been 3 per cent. The net premiums only, as computed upon each policy, have been valued so as not to bring into account any portion of the future profits. The results of the valuation shows that there are in force 14,977 policies, assuring, with existing bonuses, £6,721,502, and annuities, £18,354. The net premiums, after deducting the loading and bonus reductions, are £169,310; the net value of the assurances and annuities, £1,005,677. The accumulated funds are £1,255,335, showing a surplus of £249,658. This, we believe, is the first quinquennial valuation made in the form of the schedules of the new Act, and is therefore notable. In the fire department the premiums were £485,180 5s. 8d., and the losses, £290,685 10s. 11d. The net profit of the department, including interest, was £78,152 3s. 5d., or at the rate of rather more than fifteen hundred pounds per week.

MIDLAND INSTITUTE OF MINING ENGINEERS.—The usual monthly meeting of the members took place on the 3rd inst., at Barnsley, when Mr. Morris, of Newcastle-on-Tyne, read a paper "On Fan Ventilation," with special reference to Guibal's invention. At the conclusion of the paper, a discussion on it occurred, and, not being terminated, it was adjourned till the next meeting, when also papers will be read by Mr. Cooper "On the different modes of working coal," and by Mr. Bailey, "On signalling in mines."

INSTITUTION OF MECHANICAL ENGINEERS.—On Friday last upwards of 200 members of this institution visited the Butterley Ironworks, and inspected the blast furnaces, blowing engines, fitting shops, boiler yard, &c. The Codnor Park Works were then visited, with the refineries, the forge, the sheet mill, the rolling mill, the new forge, and the welding shop, the latter containing Bertram's patent furnaces, Warder's patent method of forming a girder or deck beam by welding two ┬ irons together to form an ⌶ section, &c.

SOCIAL SCIENCE CONGRESS.—The preparations for the annual Congress of the National Association for the Promotion of Social Science, to be held at Newcastle-on-Tyne from the 21st to the 28th of September, are in an advanced state, the appointment of presidents and special questions for discussion being already complete. The Duke of Northumberland will preside over the association, and deliver his inaugural address on the first evening of the meeting. The "Health Section" is at present thus arranged:—President, Robert Rawlinson, C.E., C.B.; vice-presidents, I. Lowthian Bell; Edward Charlton, M.D.; William Farr, M.D., F.R.S.; George Godwin, F.R.S.; Stevenson Macadam, Ph. D., F.R.S.E. 1. What is the best method of disposing of sewage and excreta? 2. What modifications are desirable in the existing sanitary laws and administration? 3. What legislative measures ought to be taken to prevent the adulteration of food, drink, and drugs?

DEATH OF SIR JOHN THWAITES.—The somewhat sudden decease of Sir John Thwaites, the well-known chairman of the Metropolitan Board of Works, occurred at his residence, Meaburn House, Putney, early on Monday morning, from an attack of English cholera and diarrhœa of only a few days' duration. He was about 55 or 56 years of age, having been born at Meaburn, Westmoreland, in 1815. He was the son of the late Mr. Christopher Thwaites, of Toddy Gill-hall, in the county of Westmoreland; his mother was Hannah, daughter of a Mr. John Smith. In early life, having received his education at a school at Reagill, in his native county, he entered business in London, and was for many years a draper and woollen merchant in the Borough and in Oxford-street. While thus engaged he was frequently employed on boards of parochial committees in the metropolis, and about eighteen years ago was nominated as one of the members of the Metropolitan Commissioners of Sewers, in which he sat as the representative of Southwark. In December, 1852, he was chosen the first chairman of the newly-established Metropolitan Board of Works. He received the honour of knighthood in 1865, as a compliment to his high and responsible office, upon the completion of the main drainage works. One of the last appearances of Sir John Thwaites in public was on the occasion of the recent opening of the Victoria Embankment, in executing which he had from the first taken much interest.

TECHNICAL INSTRUCTION FOR BIRMINGHAM ARTISANS.—Mr. Josiah Mason (some of whose splendid gifts to the town of Birmingham we have already chronicled) has purchased a site containing 4,000 yards of land, in the centre of the town, whereon he intends to erect a block of buildings in which it is intended to give practical scientific instruction to all classes engaged in the various manufactures of the town and district. Teachers of the first eminence are to be engaged to give preliminary or elementary scientific instruction.

PROPOSED NEW POULTRY MARKET FOR LONDON.—The Markets Improvement Committee of the Corporation of London have reported favourably upon their architect's (Mr. Horace Jones) plan for the erection of a new poultry market in connection with the New Meat Market in Smithfield. The estimated cost of the buildings is £100,000.

THE SURREY GARDENS.—When the new buildings at Stangate are completed, S. Thomas's Hospital will be removed from the Surrey Gardens, Newington. Various rumours are in circulation as to the ultimate destiny of the site. It is severally reported that the place is to be opened as a minor Cremorne, that the site is to be utilized for building purposes, and new streets laid out, and that it is to be laid out as a public park and recreation ground. We believe that there is more probability that the second of these rumours is the correct one; and, if so, a great opportunity will be afforded of improving the street communication of the neighbourhood. New-street, Kennington Park-road, might be continued right on to Lorrimore-square, while Manor-place and Amelia-street, Walworth, might be carried on to meet the proposed extension of New street at right angles. Even were the place to be purchased by some philanthropist for the purpose of being converted into a park—for the authorities are not likely to do so, Kennington Park being very near—the first of these suggestions might be carried out with advantage, the road being carried through the park.

IMPROVEMENTS IN BOLTON.—Some of the Committees of the Bolton Corporation are taking action with the view of carrying out a number of long-projected improvements in the town, at a cost of upwards of £29,000. The following are some of the items:—Widening Mealhouse-lane, £2,623 10s.; formation of new street from Deansgate to S. George's-road, £24,483 2s. 6d.; extension of Duke-street, £452 16s. 3d.; improvement of Bath-street, £125; improvement of School-hill, £750; and extension of Burns-street, £650. In addition to the above, improvements are to be effected at the corner of Blackburn-road and Halliwell-road, and in John Taylor-street, and plans have been passed for a new bridge over the River Croal in Mayor-street.

Chips.

Longfleet parish church, Dorsetshire, was opened on Sunday week, after restoration.

The Gravesend Gas Company have reduced the price of gas supplied by them from 4s. 6d. to 4s. per thousand cubic feet, the reduction to take effect at Christmas next.

Sir Shafto Adair will lay the foundation stone of a new Presbyterian church at Ipswich early in November.

The parish church of S. Andrew, Wormingford, Essex, has just been restored by Mr. Joseph Grimes, of Colchester.

The scheme for the erection of the Denmark Theatre and Winter Garden, in Leicester-square, has fallen through. The company proposing to start it is now in liquidation.

A new church at Helsby, one of the townships of the large parish of Frodsham, Cheshire, was lately consecrated. Mr. John Douglas is the architect of the church, which has cost £2,000, and will accommodate 300 persons.

Lord Harrowby laid the foundation stone of the new schools for S. Bartholomew's, Shepperton-street, Islington, on Saturday week. The estimated cost is £2,087.

The twelfth prize distribution of the Ceramic and Crystal Palace Art Union took place last week. The report read by Dr. Doran congratulated the subscribers that, notwithstanding active competition, the society still continued to hold its own.

The Sultan has entrusted his architects, Serkis Bey and Agop Bey, to prepare a plan of the rebuilding of Pera. It will be compared with the three other plans made by the technical department of the municipality, and a definite choice made.

The freehold site of the church of S. Mary Somerset, Upper Thames-street, occupying an area of 3,740 square feet, was last week sold by tender for the sum of £10,200.

The bridge over the Thames at Walton was opened free of toll on Monday week by the joint committee of the Metropolitan Board of Works and the Corporation of the City of London.

The Marquis of Westminster has offered a site for and a donation of £1,000 towards the erection of a workmen's club and institute for Pimlico. £1,500 more is required for the building fund.

The Duke of Devonshire has consented to lay the foundation stone of the new buildings for Owen's College, Manchester, on September 5.

New schools for the church of the English Martyrs, Preston, were commenced last week. Mr. Edward Bickerstaffe is the contractor.

The new Corporation Baths at Bath have just been completed. Messrs. Wilson and Willcox are the architects

A meeting of the principal shareholders in the Wirksworth Town Hall Company was held on Tuesday afternoon to receive the various designs sent in from the architects who had been invited to compete for the erection of the building. Messrs. Thompson and Young, of Derby, are among the competitors.

Several alterations are about to be made at the Tiverton Borough Gaol, from plans by Mr. Williams, architect.

A public meeting has been held in Salisbury, under the auspices of the Corporation, to consider what steps are necessary to be taken in order to establish public baths in the city. Lord Radnor has offered to give a site.

An act has just received the royal assent for the construction of a pleasure pier at S. Leonards, about a mile distant from the Hastings pier. It will be built chiefly of iron on screw piles, and is to be about 750 ft. long, and to cost £15,000. A glass pavilion will be placed at the seaward end, and there will be refreshment and other stalls.

WAGES MOVEMENT.

THE SHORT TIME MOVEMENT IN THE LONDON BUILDING TRADES.—The nine hours' movement, which proceeded with such apparent success during the early part of the year, would appear (says the London correspondent of a Sheffield paper) to have collapsed for the want of pecuniary support. Almost every man in the trade desires the nine hours work per day, but as payment by the hour is the rule in London, comparatively few appear willing to make a present sacrifice of six hours' pay, or 4s. per week, for a possible future benefit, and hence the lack of pecuniary support rendered to the committee who undertook the movement. The committee, however, are not disheartened, and being composed of the best and most intelligent men in the trade, they are resolved to renew their efforts at the earliest opportunity.

THE AMALGAMATED ENGINEERS AND THE PARIS IRONFOUNDERS.—The ironfounders of Paris having been on strike for several weeks for an advance in wages, weekly instead of monthly payments, and the abolition of piece-work, overtime, and Sunday labour, the executive Council of the Amalgamated Engineers entertained an application from them for pecuniary aid, and having satisfied themselves that the cause was one deserving of support, the branches of the society were consulted as to allowing the council to place a 2d. levy upon the members. The result was that 7,045 voted for the levy, and 557 against. The levy was therefore made, and the amount raised, £254, has been paid to the delegate from Paris.

TENDERS.

BRIDLINGTON.—For the erection of tower and spire, Holy Trinity Church, Bridlington:—

Rennard	£1400

CAMDEN TOWN.—For the erection of stables, living-rooms, &c., in Camden-road, for Dr. Andrews. Mr. H. Spalding, architect, 1, Bloomsbury-place, W.C. Quantities supplied:—

Brass	£795
Beaves	729
Phillips & Son	715
Carter & Son	675
Woods	6 0
Patman and Fotheringham	594
Scrivener & White (accepted)	573

CITY.—For alteration to a warehouse, Wood-street, City, E.C. Mr. Herbert Ford, architect.

Henshaw	£470
Kiddle	443
Dr ss	438
Shaw	394
Conder	378
Browne and Robinson (accepted)	362

DERBYSHIRE.—For alterations of and additions to farm buildings at Cliff-park and Mansell-park, Hulland, Derbyshire, for Mr. J. C. B. Borough. Mr. Sugden, architect, Leek:—

Smith (accepted)	£965

DERBYSHIRE.—For new farm-house and buildings at Carr Hall, Derbyshire, for Mr. J. C. B. Borough. Mr. Sugden, architect, Leeds. Quantities supplied:—

Smith (accepted)	£2324

HAMMERSMITH.—For the rebuilding of Infant's school-room, for the Broadway Congregational Church, Hammersmith. Mr. H. Spalding, architect, 1, Bloomsbury-place, W.C.:—

Scrivener & White	£354
Adamson & White	322
Bird	330
Braithwaite	330
Adams	3 6
Woods	3 5
Chamberlain	324
Hanks (accepted)	270

KENT.—For the erection of Public Hall at Bexley Heath, Kent, for the Directors of the Bexley Heath Public Hall and Institute Company (Limited) (First contract. Mr. Joseph Hewitt, architect. Quantities supplied.

W. Atkinson	£1367
J. N. Faithorne	1250
Harrison & Sons	1187
Rhodes & Roberts	1179
J. Pollard	1145
Charles Bowler	1092

Parsons Telling	1019
London Building Company (Limited)	997
T. Peck	995
Thomas Blake	915
Arrived too late	
J. R Willis	1038

LONDON.—For the erection of a building, No. 3, Bartholomew-lane, E.C., for the Estate Company (Limited). Mr. E. A. Gruning, architect. Quantities supplied by Messrs. W. R. Gritten & Son.

J. and J. Coleman	£9260
Mansfield & Price	9130
Ashby & Sons	9050
J. & C. I'Anson	89 0
Wm. Brass	8893
Holland & Hannen	8873
G. Trollope & Sons	8684
Hill, Keddell, & Waldram	8680
Wm. Henshaw (accepted)	8475

NEWINGTON (SURREY).—For the erection of Holy Trinity Rectory. Henry Jarvis & Son, architects:—

Shapley & Webster	£1985
Baguley	1797
Colls & Son	1797
Downs	1790
Henshaw	1762
Thompson	1760
Tarrant	1743
Marsland & Son	1735
Shepherd	1730

POTTON (BEDS).—For the erection of a dwelling-house at Potton, for Mr. J. Felts. Mr. Usher, architect, Bedford.

Knight & Boston	£ 197 16 0
Brown	180 19 6
Haynes	178 10 0
Corby & Son	174 16

THE BUILDING NEWS.

◆

LONDON, FRIDAY, AUGUST 19, 1870.

DECORATION OF S. PAUL'S.

NO work of the present century can compare in its possible influence upon the art of the country with the proposed decoration of S. Paul's Cathedral. For good or for evil this will in importance eclipse all others—that is, supposing the enormous sum proposed to be raised be really collected. The state of S. Paul's Cathedral, the finest building of its kind and date in Europe, has doubtless been a disgrace to London and the whole nation. If well spent, no sum of money should be grudged by this enormously wealthy city to complete this magnificent work; but when such a sum as a quarter of a million is talked about, it behoves all whose voices can be heard and whose opinions are worth hearing in the matter to exert themselves in endeavouring to prevent any avoidable mistake in so serious an undertaking. If we look round and consider all the buildings upon which much has been expended in decorative work in this country, we cannot help feeling considerable misgivings. The piecemeal adornment of the Houses of Parliament by men of different talents, tastes, and principles has resulted in the production of some fine pictures, though of very unequal merit, all of which might be separated without damage to themselves or the building whose walls they cover; but as a specimen of decoration it affords a good example of what should not be done—as a salutary warning against great expenditure without competent and adequate design. If the decoration of S. Paul's is to be a success, it must be, in outline at least, the production of one brain, whoever is employed to carry out the detail, to paint the pictures, or design and execute the mosaics, and, perhaps more important still, draw and paint the glass. Whether this is executed in England or Bavaria, every detail should be studied and controlled by the master-mind who is to direct the whole. Have we such a master-mind among us as to be properly intrusted with so great a work and fitted to deal with such sums of money? In answering the first part of the question we must not forget that it is not only the adornment of S. Paul's that is contemplated, but its adornment in honour, to a great extent, of its great architect, and so, of course, as far as his mind can be discovered, in accordance with what he would have wished done if he had lived to do it. Now, so far as the decoration has gone at present, not only have the designs of the original architect not been carried out, but important parts of his work—one upon which his only memorial was inscribed—have been uselessly tampered with or destroyed. The fine screen which used to support the organ, and the excellent iron grilles on either side of the Sanctuary, were demolished for no earthly object whatever except a false taste—an outrage which could only have been permitted and committed by a total disregard for and possible dislike of the art of Sir Christopher Wren. "Oh! but," some one will say, "if this grand design in contemplation is to be realized, the present Cathedral architect will not be permitted to destroy or innovate—in fact, a new regimen of conservatism has evidently set in, for the grilles are to be replaced and a new screen worthy of the place is to be erected." One would be inclined, however, to question whether any one so worthy could be placed there as that erected by the architect himself. Still, granting all this, before any of the money subscribed is spent, we ought to know for certain whether Mr. Penrose, under the control of any committee, is the right man to do this vast work. If so, he certainly ought to show upon paper, with a sufficient amount of detail to enable the public to judge of his fitness, what his designs are. The subscribers to the Fund and the citizens of London have a right to know what they are giving their money for, and what is to be the fate of that building which is justly the pride of the metropolis.

As far as the finances are concerned, the episode of the Wellington Memorial, as shown by us last week, offers a warning. Surely, before being intrusted with the supervision of an expenditure of £250,000, or anything like it, the architect should show distinctly upon what grounds he certified the large payments to Mr. Stevens, amounting to considerably more than his original contract for the complete work. If the excuse is to be allowed that artists who have gained a certain position have other commissions to execute, though that very position itself may be to a great extent due to their public employment, it will be far better to give the work to younger artists, and bind them over to take no other commissions till the work in hand is complete. We believe, however, that this financial view of the case is by no means the most serious; waste of money and time are most vexatious, and, as far as foresight can prevent it, all care should be taken to do so before the work is begun. But however much money may be squandered—however much time wasted—if the subscribers and country get a worthy return for their money and patience in the end they will be satisfied and not grudge the loss. No saving of money or time will compensate for inefficiency of work or feebleness and badness of design. It is here we have the greatest misgivings, which nothing but full drawings of every part will do away with. We know nothing of any of the gentlemen spoken of as likely to be employed calculated to inspire us with much confidence. If there ever was a case in which employers had a right—and more than that, a duty—to see what they were going to pay for before they subscribed their money, it is this decoration of the Metropolitan Cathedral.

"Si monumentum requiras circumspice." If you want a hint of how the whole thing may be managed, go and look round for yourself. If any one will take the trouble to see what has already been done, he must be a sanguine man if he has no misgivings as to the future. First, there was the needless destruction of ancient features above mentioned; then came the decoration of the sacrarium, with its ill-drawn, spiritless, grisaille painting and sham recessed panelling. We are quite aware that imitations in paint of various materials and constructions have been in use in all times, though very seldom in the best examples; but surely the very worst species of imitation is the feigning of sculpture, mouldings, and panelling. We should say this even if Wren himself had so designed any of his decoration. If nothing better can be done with the domes surmounting each bay of the roof than to cut them up and reduce their apparent size by this sham lacunation, it is a grave question whether they had not far better be left plain.

Lastly, we have the specimens of mosaic work. These, as far as material is concerned, are excellently done; but what can be said of the designs? Isaiah is the picture of a man suffering from very short sight trying to make out an inscription on a tablet, and attended by two angels with their wings cut square to fit them into the place. S. Matthew is better; but there the angel seems to be seated on the edge of the arch, and so appears to be slipping down in a most uncomfortable manner. These things show plainly enough that if anything like the amount mentioned is to be spent to any advantage, greater art powers than any at present exhibited will be required Does the present staff possess it? If so, let it be shown before the expense is incurred, and let an opportunity be given to the subscribers and public of judging the fitness of the architect and artists and the goodness of the designs. If they can show such a series of decorations as to satisfy the reasonable expectations of the people, well and good. We may be sure that the drawings will be none the worse, nor the decorations, as a whole, less considered, through their being prepared beforehand with a view to public exhibition and criticism. The decotion of S. Paul's, though practically in the hands of the Dean and Chapter, is really a national affair, interesting alike to those liberal persons who are subscribing large sums of money and the thousands who, though many of them unable to contribute to the funds, look upon S. Paul's as the glory of London. So little has been done successfully at present in this matter of decoration that there is doubtless great difficulty in deciding who shall do such a work as this. The case of the Houses of Parliament has demonstrated the absurdity of picking out a certain number of celebrated painters, both on the ground of expense and taste. If there ever was a case in which an unlimited competition was called for it is this. These matters have been much more studied of late years than they were in old times. Who shall tell whether among our own architects or other artists a designer to rival M. Lemeire might not be found, who would prepare a series of iconography and designs which should make the decoration of S. Paul's an epoch in art, and not what it threatens to be, and what most of our attempts at decoration on a large scale have hitherto proved to be—a disastrous and costly failure? Of this we are quite certain, that a moderate sum spent in premiums for the three or four best sets of drawings would be well spent, and that really in the end such a course would be as economical as wise and provident.

◆

SUNDRY DECORATIVE WORKS AT THE KENSINGTON MUSEUM.

(Continued from page 93.)

THE staircases and corridors, which we have mentioned as being fit positions for decoration, need not fear to do injury to, or to be injured by comparison with, such objects as the contents of this museum. Accordingly, we find that such spaces have been selected for much sumptuous display of the kind. The large staircase leading up from the north cloister to the picture-galleries is a specimen. Like most of the art fostered at South Kensington, it is highly eclectic—the result of careful study of ancient precedents. One's eye is thus caught at once by the rich and delicate ceiling and pleasantly reminded of those of Moorish construction. The wooden construction is properly revealed and decorated, each rafter being bracketed down to the corbels of the cornice. A raking portion is carried round the walls, and an oblong space in the centre is level and divided into three panels, the central one square, and a narrow oblong one at either end. A delicate octagonal gilt metal grille occupies the main portion of the space of the central square panel. This being over the gaselier provides good means of ventilation. Carved pendants mark the points of intersection of the main beams of this ceiling. The treatment in colour is rich and delicate—gold and white and grey, with the ground of the panels dark. The general effect is undoubtedly good; and it is only when we come to investigate closely the details that we are disappointed. Thus, then, we find that in a most costly work all that has been spared has been thought and invention on the part of the designer; that one monotonous pattern fills the whole of the numerous panels; and that the commonest Greek fret is the invariable border around them all. And, lastly, but not least, we must consider open to criticism the fact that this ceiling surmounts plain maroon-tinted walls with a simple chocolate dado. Herein is the eclectism weighed and found wanting. A rich Moorish ceiling is always found crowning an apartment with both elaborate walls and pavement in harmony. Here this ceiling looks but one of the many isolated specimens of beautiful work with which the museum abounds. We need not further point to the discrepancy between the Oriental framework and the Renaissance ornamentation of this ceiling; what we have said we think may suffice to show that in this, as elsewhere, the general character of the work of the Department is consistently carried out in inconsistency. We cannot, however, quit this staircase without some notice of its prominent feature — the large semi-circular-headed window above the landing. It is filled with a Renaissance architectural composition, with pilasters and baluster-like columns enclosing sundry pictured panels—a pair of forcibly drawn and equally forcibly coloured lovers clasping hands in the centre, and an incongruous and incomprehensible mass of ornamentation in the arched head above. The details throughout are of the stupidest nonsense ornament of the nonsensical style that has been selected. The sham projections and perspectives are palpable absurdities, and the general effect spotty and unsatisfactory in the extreme. The ordinary staircase and its cast-iron railing again proclaims the borrowed nature of the far finer plumage overhead.

We are not, however, confined in this museum for studies of decoration to these eclectic ones of its decorators, but many valuable collections of drawings of the most renowned specimens in the world are to be found upon its walls or in its revolving cases of frames, and to these we intend occasionally to refer for the benefit of our readers and students of this branch of art. In the vestibule of the portion of the museum in which the Meyrick collection of armour is displayed, are now hung some exceedingly interesting copies of the fresco paintings which have recently been discovered in the crypt of the church of S. Clemente at Rome. To these we desire to direct attention, and for that purpose we append the following notes made upon some of them, which will give an idea of their character and value :—

No. 1 is a male bust—unknown—of old classic character, date about 300 A.D.; sketchily but clearly drawn, features of full Roman type, naturally and not conventionally expressed. No. 2 is a female saint—unknown—with nimbus. Date beginning of fifth century; though in some degree resembling the last example, less careful and more conventional. No. 3 is The Crucifixion, with the figures of the Virgin Mary and S. John, believed to be the earliest known mural painting representing this event. Date about 646-50 A.D. Very rude art—almost all classical character lost, and conventionality substituted, but not as yet fully developed. Similar in character, but interesting from the composition of its separate subjects, is No. 4, which represents the Marys at the Sepulchre, the Descent of our Lord into Hades, and the Marriage of Cana; the last subject imperfect, but recognizable by the Architriclinus, or Ruler of the Feast, standing near our Lord. Date probably about 650 A.D. Below these are hung a painting in tempera, on canvas, of a standing female figure, with the inscription "Dionysas in Pace," copied from another fresco in the cemetery of S. Callistus, supposed to be of the second half of the third century, and an oil painting on canvas of a robed female figure with extended arms, probably S. Cecilia, copied from a fresco in the cemetery of S. Callistus, part of the Roman catacombs, the original of which is a work of the seventh century. These, though coarse and inartistic, are very interesting by way of comparison among themselves and with those of S. Clemente. In the former, the classic feeling in the figure and the freedom of imitation of nature in foliage, with the bird in the background, are manifest; whereas, the latter, by the diapering of the robe and its jewelled borders—in themselves, by-the-way, tasteful both in colour and design—evidence the nascent Christian style of ornament, while the rude head betrays a reminiscence of Pagan types. No. 5. The Assumption of the Virgin Mary—the date of which appears to be fixed at about 850 A.D., by the introduction on the spectator's left hand of Pope Leo IV., apparently as a personage then living—shows a panelled ornamental dado about 4ft. high, with rude scrawls of vegetation in brown upon the panels, which are of a yellowish-white ground, defined by a black line, and a vemilion red band is carried round them. The principal subject occupies an oblong space about 6ft. long by 3ft. high, with a semi-circular niched addition to the centre above. The Virgin is seen with extended arms upon a sepulchred rock, and our Saviour, surrounded by a Vescica form, borne by four angels, appears in a starry firmament ready to receive him. The twelve apostles are ranged six upon either side, with the arm of one of them stretched upwards, as if pointing, but with the evident aim of aiding the symmetry of the composition; to carry out which further the figure of the Pope terminates the picture on one side and a corresponding saint performs the same office on the other. The figures are in sober-coloured costume of white robes, with an occasional yellow or brown mantle, and are thrown up by a vermilion wall and dark green sky above. Rude as is the drawing throughout, and conventional the arrangement, the effect is solemn and dramatic, and the composition is not without grace, particularly in the treatment of the Angelic supporters of our Lord. No. 6 is the Translation of the Relics of S. Clement, by Pope Nicolaus, from the Vatican to the Basilica of S. Clement, a votive offering, given by Maria Macellaria, date about 900 A.D. The picture, though highly interesting, is in a degraded style of art, with but little of dramatic effect. The superior dignity of the robed prelate, seated at the shrine which is to receive the relics, is clumsily conventionalized by his figure being of a larger size than the rest, and, though his hands are extended as in adoration, he is looking straight out of the picture and away from those who are inviting his attention. Acolytes are bending under the weight of a litter, upon which the body of the saint is borne, and others are swinging censers behind, and a crowd follow with the cross and banner-bearers of the procession, and the whole, by the sloping line given by their heads against the sky, seem sliding against the frail temple, which they appear as if they would overwhelm. A remarkable ornamental band runs below the picture, and a dado below that, the motif of the decoration in the former looking like rich Byzantine, and of the latter of meagre Classical work. In Italy, during all the ages of Christianity, the remnants of Classic art, always among the people, modified their ideas and their practice, and we continually see a struggle going on between the elements of Classicalism and Mediævalism, but this early instance of the kind is one of special interest.

There are also copies of other frescoes at S. Clemente than these we have noted, but we have not time upon this occasion to do more than refer our readers to them; we may, however, upon another opportunity, return to them, as well as to the other stores for the decorative student which are to be found in this most valuable museum.

◆

WROUGHT IRON CRANES.—III.

OUR two preceding articles on this subject were confined solely to a practical description and illustration of the ordinary method of constructing wrought-iron cranes, and we reserved, for a third and concluding article the question of their theory and scientific analysis. It has been already stated that mathematical formulæ and algebraical equations are not suitable for those particular examples of construction in which the different parts are inclined to one another at angles which not only vary among the parts themselves, but are also dissimilarly inclined to the horizontal. An example of our meaning is given in Fig. 2, which represents a skeleton elevation of a wrought-iron bent crane. In practice, the outer and inner flanges are curved as shown by the dotted lines, but they are considered theoretically to consist of a series of straight lines joining the several points where they are connected with the diagonal bars forming the web. These points may, in reality, be either pins or rivets, but bearing in mind to what tremendous jerks and vibrations cranes are subjected, there would not be any particularly valid reason for employing the former kind of attachment. After a time, pins must work loose; rivets never do. To determine the strains upon the crane represented in Fig. 2, which is supposed to be loaded only with a weight at its peak L, we start from the fundamental principle that governs the distribution of strain upon two separate members inclined at different angles to the horizontal, and acted upon by the same weight—to speak dynamically, by the same force. This principle, which it is necessary thoroughly to understand, will be best explained by a reference to Fig. 1. Let A C, B C, be two bars inclined to the horizontal line F G at angles respectively of 60° and 45°, and supporting a weight W at their junction C, which let us take equal to 1 ton. By the method of resolution of forces, construct the triangle C D E, and make C D = 1 ton. Draw D E parallel to B C, then D E will equal the strain upon B C, and E C that upon A C. If these strains be measured off upon a scale of two tons to the inch, which is the scale upon which C D is drawn, they will be found to equal respectively 0·50 and 0·71. It is not difficult to prove that these values are in the ratio of the cosines of the angles which the bars make with the horizontal line F G. By the principles of trigonometry we obtain in the triangle C D E the proportion D E : E C : : sine E C D : sine E D C. But the angle E C D is the complement of the angle E C F, which in the diagram was made equal to 60 degrees; similarly, the angle E D C is equal to the angle D C B (Euclid, prop. xv., book 1), which is the complement of the angle B C G, which is equal to 45 degrees. As the sine of any angle is equal to the cosine of its complement, if we call the strain upon the bar B C = E D = S, and that upon A C = E C = S^1, we have $S : S^1$: : cosine 60° : cosine 45°. Substituting the values of these in the equation, we find 0·5 : 0·71 : : 0·50000 : 0·70710, a sufficiently close approximation to prove the accuracy of the diagram.

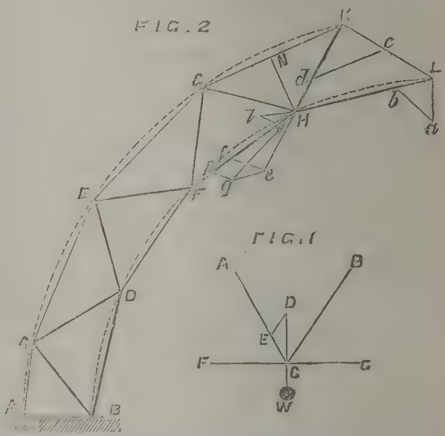

FIG. 2

FIG. 1

A similar method is employed in deducing the strains upon the crane in Fig. 2, with the exception that, as we proceed, the resolution of the different forces becomes rather more complicated, but not to such a degree as to hinder any one from mastering the subject with care and attention. At the same time, it is not to be supposed that a mere casual perusal of our article is sufficient to enable our younger readers to comprehend the matter thoroughly. Far from it. They must study—not merely read—it, and work out for themselves the diagrams to a conveniently large scale. For the sake of simplicity, we will suppose that there is a weight of one ton only at the point L, in Fig. 2. The advantage to be derived from this is that when once the strains due to a weight of one ton have been ascertained, all that is necessary to obtain those on another crane similar in design but loaded with a different weight is to multiply them by the constant ratio between the original or standard weight and the one in question. It must not be forgotten that any alteration in the design of the crane, such as changing the radii of either the inner or outer flanges, or the angle of inclination of the bars, will altogether vitiate the calculation. To return to our diagram in Fig. 2. Let L a equal one ton, supported at the front L. How does this produce strains differing in character and intensity throughout the whole structure? In the first place, the weight being supported at the connection of the two bars K L and L H must strain both of them, compressing the latter and extending the former. The parts in compression are shown by thick black lines, those in tension by fine ones. From the point a, draw $a\ b$ parallel to the bar K L, meeting the chord of the part L H of the lower flange in b. Then, measured on the same scale, $a\ b$ will give the strain upon L K, and L b that upon L H, and they are respectively equal to $-$ 1·3 and $+$ 1·05 tons. The sign minus denotes a tensile strain and $+$ a compressive. Leaving this latter strain alone for a moment, let us trace the further action of that upon L K. This is obviously transferred to point K, where it acts upon G K and K H, extending the former, and compressing the latter. Upon K L, plot off K c equal to $a\ b$, equal to the strain upon K L; draw $c\ d$ parallel to K G, meeting K H in d. The lines $c\ d$ and K d will give the strains upon G K and K H respectively, and will be found equal to $-$ 2·15 and $+$ 1·85 tons. Following the strain upon K H, it is transferred to the point H, where it pulls upon the bar G H and compresses H F. If there were no other force acting upon the point H, nothing more would be required to find the strains upon the members G H and H F than to proceed as before. But there is the strain upon L H, equal to L b, to be taken into consideration, and how it also affects the bars acted upon by the strain upon K H. It will be seen on inspecting the diagram that it compresses H F, and also compresses the bar G H, which is, on the contrary, stretched by the strain brought upon it from K H. But it has been frequently mentioned in our articles on constructive subjects that when a bar or part of a structure is acted upon by forces or strains of both tension and compression, the actual strain is the algebraical sum of the two. Thus if a bar have a tensile or minus strain of 7 tons, and a compressive or plus strain of 4 tons, then the actual resulting strain is $(+ 4 - 7) = - 3$ tons. This is just what occurs in the present case, and we thus see how important it is to remember these fundamental axioms. The bar G H is acted on by a tensile strain in the direction of K H and a compressive one in that of L H. It is the difference, therefore, of these two which is the strain really affecting the bar.

There are two methods of resolution by which these strains on G H and H F may be determined. One is by proceeding as has been already done, taking care to take the algebraical sums of strains of a different character where they are so, and the other to first find the resultant of the two original strains, and then completing the diagram of forces. Let us consider the former method first. Produce K H to e, making H e = K d = strain upon K H. From e draw $e\ f$, parallel to G H. Measure $e\ f$ and f H, and these will represent the strains upon the bars G H and H F, due to that transferred to the point H by the bar K H, and will be $-$ 1·0 and $+$ 2·4. Now for the other strains, produce L H to l, making H l equal L b equal the strain upon L H. From l draw $l\ n$ parallel to G H, and $l\ n$ and n H will be the other strains upon G H and H F, and will scale $+$ 0·5 and $+$ 0·63 tons. Summing up, we obtain the total strains upon these parts of the crane to be as follows:—Upon G H $(- 1{\cdot}0 + 0{\cdot}5) = - 0{\cdot}5$ tons, and upon H F $(+ 2{\cdot}4 + 0{\cdot}63) = + 3{\cdot}03$ tons. By the second method, the resultant of the strains of K H and L H must be first ascertained. Produce K H to e as before, draw $e\ g$ parallel to L H, and equal to L b. From g draw $g\ h$, parallel to G H. Then $g\ h$ will be found, on measurement, to equal $(ef - l n) = - 0{\cdot}5$, and h H to equal $(\text{H}\,n + \text{H}\,f) = + 3{\cdot}03$ tons. At the point G there are also two forces acting, namely the strain due to the bar G H and that to K G. The resulting strains can easily be determined upon the parts G E and G F by either of the methods we have just investigated. We cannot spare space to go through every strain, nor is there any necessity, as the determination of the others is simply a repetition of what has been already done. Those who desire to thoroughly understand this operation must make a good large diagram of Fig. 2, and work out the whole problem for themselves, taking care to tabulate the strains upon each bar separately, so as to perceive how they accumulate from the free to the fixed extremity of the crane.

Although this method of calculating strains is perfectly accurate enough for all practical purposes, yet, as it is a consecutive one, it is advisable to check the strains in the flanges at intervals. This may be readily done by very simple formulæ. For example, the strain upon the bar K G has been found by the diagram to be equal to $-$ 2·15 tons, and it may be checked as follows. It is manifest from the principle of moments that the strain at any point multiplied by the leverage with which it acts, will be equal to the weight at that point, multiplied also by the leverage with which it acts. The strain on the bar G K acts with a maximum leverage of N H, equal to 3·5 feet, whereas the weight at L acts with the horizontal leverage of H a, equal to 7·9 feet. If S be the strain required, L its leverage, W the weight, and L′ its leverage in the general formula, $S = \dfrac{W + L'}{L} = \dfrac{1 + 7{\cdot}9}{3{\cdot}5.}$ From which we obtain $S = - 2{\cdot}2$ tons, which checks the accuracy of the calculation by diagram. Great care must always be taken in calculating by diagram, as there is always a tendency for errors to accumulate. One false step at the commencement, if it is not perceived, is perpetuated in all the succeeding operations, and would ultimately cause a very serious difference in the correct values. But by using the method of moments to check the results, no such accumulation can occur, and one is enabled to perceive, as the working out of the diagram proceeds, that the calculations are rightly performed. One or two checks of this kind should always be introduced, as, if the whole operation is effected first, and the strain upon the last flange not found to be correct, the whole work must be gone over again to discover the error.

BUILDERS *VERSUS* ARCHITECTS.

(*Concluded from page* 111.)

SUCH of our readers as may have perused our last week's article may also have seen that the subject is still kept up in our column of "Correspondence." We now briefly conclude our own observations upon it. It is agreed on all hands that the present training of the English architect is very inadequate. Such, however, as it is, it is endorsed with the approval of the Royal Institute, which admits to its highest ranks any respectable man who may have been for seven years a simple practitioner, good, bad, or indifferent. It follows that no proposal to invest its Fellows solely with the function of an arbitrator in building disputes can hold water. If the Institute is strong anywhere it is in the metropolis; but we greatly doubt whether, in a case of building dispute, even a London builder would not prefer the arbitrament of any of our metropolitan building surveyors. These gentlemen are, by the operation of the very rule of professional practice set up by the Institute, better used to enter into the "minutiæ" out of which building disputes usually arise—that is to say, in nine cases out of ten, out of questions of value, questions of trade-custom, and questions of modes or measuring artificers' work. How is a Fellow of the Institute, who, agreeably with the unchallenged dictum of its late President, abstains from questions of money value, to deal as an arbitrator with such questions? He must necessarily take counsel with some building surveyor, who would himself, peradventure, have made a more efficient judge for the final settlement of the dispute. We do not seek to set up building-surveyors against Institute Fellows. Some of these latter are admirably qualified to officiate as arbitrators. We are simply speaking of Institute Fellows as a body: of their entire absence of any special training, as Fellows, for the functions of an arbitrator. In such a precarious profession as that of architecture, a most estimable man may very well have been "seven," nine, or even eleven years "in practice;" and yet all that time have had little or no *practice in building*. This is of course his misfortune rather than his fault; but it is clear he will thus be very unfit for an arbitrator, having nothing but his Fellowship (that is to say, his seven years' "practice") to exhibit as his qualification for the office. Sorry, indeed, are we to observe the Institute year after year maintaining so inadequate a criterion for its Fellowships. It is the hateful opprobrium of a professional corporation, that might do, and ought to do, more to foster and to purify the building trade. It is all very well to be angry with Mr. Ayrton: we question very much whether the right honourable gentleman, with all his faults, is not a Frankenstein of the Institute's own raising!

But we are forgetting our good friends the builders, who will persist in drawing plans for capitalists who wish to build, and who will not repair to the office of the designing architect, design he never so wisely. Well, we cannot for the life of us see why our architectural—or rather our professional—friends should take such umbrage at the act as many of them appear to have done, judging from the angry letters they have written us. Why should not a builder make plans, or even ornamental designs, if it comes to that? There is no mystery or trade secret in the making of such drawings; and there is, moreover—what these irate gentlemen have forgotten—no royal road to the making of such documents. If a man wants plans, but will not have an architect's supervision, we should ourselves advise him by all means to apply to an architect in preference to any one else, simply because the preparation of plans is his special vocation. But if he will not go to an architect, there is no reason why he should not go to any other person who is competent to draw plans. There are many such persons out of, as well as in, the ranks of the professional body aggrieved; and among them it is indubitable our friends will have to include builders. They make the plans, such as they are—possibly very good, probably very bad, most probably quite useless; they get paid for them, and there is an end of the matter. It is not pretended that these erring builders have been officiating as architects. If they do, and at the same time contract to erect the building in question, they remain simply builders, not architects, to the employer who has simply (very simply) engaged them in that dual capacity. If, on the other hand, these incontinent, obnoxious "builders," charged with inserting a foot into the architects' trough, do pretend to officiate *simply* as supervisors of the building they have "drawn," what have our professional friends to complain of? They may term them "builders," if they please; but we should call them "architects," to all intents and purposes—that is to say, they are real denizens of that magic circle in which, if they keep respectable for seven years, they are certain (if they can and will afford four guineas a year) to effloresce as full Fellows—yes, Fellows—of the Royal Institute of British Architects. We should very much like to know how any English architect is at this present writing to get higher up on the architectural ladder than that? As English architects, we put the query with, we confess it, unfeigned sorrow and humiliation.

No: it will not do to throw stones at these plan-drawing builders; not, at all events, while this dreadful war against professional architects is raging in Whitehall-place. If our professional friends can really draw better plans than the builders can, it is well; let them somehow (the Institute knows how—we do not) get the "discerning" building public to see the plans or to appreciate the fact. We have, unfortunately, no other genuine credentials to produce. They do not recognize our special architectship at Whitehall; the public does not recognize it; we have none to show them for their money; no guarantee of our special fitness for plan-drawing; nothing but our—as we think—very superior plans to exhibit. The public never sees them: it will not come—most stupid public—to the Architectural Exhibition; and it goes, as Mrs. Malaprop has it, "promiskerously" to the builders. The architects, ill-employed in these hard times, "swear consumedly" at the incident. Let them ponder for a while at the moral—we trust it has one—of our article.

We began it by sympathising with the writers of the letters we have printed in our columns of Correspondence. In closing it, let us say we have no sympathy with either the builders or the architects who bandy imputations of "scamping," bribery, and foul dealing. These things are, like plan-drawing, peculiar to mortals of every trade and vocation. Their practice, whatever our friends may think, is purely cosmopolitan; by no means restricted, as their letters seem to imply, merely to builders, nor yet to architects.

W. Y.

THEORY OF THE ARTS.

(*Continued from page* 77).

THE æsthetic development of the Middle Ages was high because the intellect, the physical and moral faculties, were governed, and obtained a sort of provisional harmony under the theological or ecclesiastical dominion. Taste—which is strictly analogous to or the same as the moral faculty, inasmuch as both are of a compound character, requiring a judgment of the understanding or reason as well as an emotion or capacity to feel pleasure of some sort—obtained under the social-religious organization of Catholicism a freer exercise than it could possibly have when the intellectual and moral natures are in antagonism, as they had previously been under Roman civilization, and which they were afterwards subject to again when a separation became necessary between scientific progress and the Church, or between intellectual advancement and dogmatism. For about two centuries art reposed upon a generally-admitted system of philosophy, and acquired an expression distinct from all that had preceded it and all that has followed it. Taste, or the feeling for art, is, as I have said, of a complex nature, and always requires the "pre-existence" and "co-existence" of certain faculties of our nature in their free and harmonious exercise. When the intellect is estranged from the moral power, or there is a sort of unreal feeling subsisting between the two; when reason and conscience do not agree, as often with the individual, the capacity for judging rightly, whether in moral actions or in art, is destroyed or rendered useless. No man under such a condition can discriminate right from wrong, the beautiful from the deformed. Art becomes an unreal expression. But as in the individual so in society there is an abnormal or perverted use or agreement of these faculties, often due to improper education. A man judges or conceives a thing wrong or ugly which another believes to be the opposite with the conviction of both the above faculties. This is due to education. His conceptions are perverted in some points from a deficiency of proper training; so it was with the conceptions of the artists of the Middle Ages in respect of the representative arts of sculpture and painting particularly.*

Architecture being an art in which the faculties of abstraction are concerned rather than those of perception and imitation (indeed, itself an abstraction of the mind), excelled. Where the slightest conventionalization is used in the art of the sculptor or carver we find unexampled skill, but not so where the imitation of natural objects is required. Thus in the portrayal of the human figure a low, coarse estimate of physical beauty is the characteristic type met with. Bad drawing and ignorance of perspective show the neglect the imitative arts had suffered. As I have said, the tendency to represent "directly" the object of worship gradually increased, but the religious ideal of the period was too low for the exercise of the higher faculties of conception. Again, the æsthetic sentiment necessary in these arts was quite subjected to the devotional feeling, which in its monastic or ascetic form was totally irreconcileable to art. Between the sixth and twelfth centuries the ascetic ideal of ugliness was supreme, and exercised an unfavourable influence. The veneration of relics of the martyrs and image-worship rather checked the progress of correct and good taste in art than otherwise, because it unduly subjected the material conception to the spiritual or religious ideal of the time. Bodily torture and suffering instead of beauty were associated with holiness; and it may be generally observed that art becomes reflective of the emotional parts of theology of every creed. We find that the spiritual conception of a Supreme Being was not materialized or represented by artists till about the fourteenth century, when portraits of the First Person of the Trinity became common (see Didron) and assumed various degrees of rank till the figure became the central one. The deification of the Virgin arose from the great want felt during this period to materialize spiritual conceptions, and it may be said that the Mediæval conception of the Virgin exercised a beneficial influence, and was probably the highest ideal, as significant of moral charm and beauty, that the artist of the Middle Ages conceived. The great error, however, in the artistic conceptions of the time was in believing there was an impassable gulf between the physical and moral; or that ascetic practices and bodily restraint were necessary to a virtuous life. Gnosticism, for instance, maintained the essential evil of matter, and the propensities of the body were to be subdued. It was under this belief that the hideous and repulsive carvings and representations that adorned the cornices, bosses, stringcourses, and other ornamental accessories of architecture were conceived, as it was a belief in a hell—a religious terrorism that stimulated the religious devotee to works of unparallelled self-sacrifice, cost, and zeal.

Architecture was, *par excellence*, the art of the Middle Ages, the other arts being subordinate to it as accessories. There was a proper relationship or co-ordination between the arts then which frequently at the present day we sadly lose sight of. For instance, it is not rare to find a new modern-fashioned church erected in miserable keeping with the decoration. Exteriorly we get a barn-like, ill-proportioned structure of stone, or, more frequently, a mixture of stone and brick, in a Franco or Italo-Gothic style, built in accordance with the whimsical and crude notions of a leading popular "high-ritual" architect—I do not want to be invidious—while interiorly we find an extravagant parade of fancy brickwork of the most *bizarre* description, the walls and fittings being bedizened to such a degree that all structural harmony and truthfulness is completely destroyed. This want of repose and subordination we never find among the works of the Mediævalists. The reason we do now is pretty obvious, and I shall endeavour presently to explain. Christian architecture properly commenced from the age of Constantine, after the separation from the Western Empire. Two great divisions sprung from Roman art. First, the Byzantine, the style used by all the Slavonic races of Europe, adopted by the Greek division of the Church, and by the Christians of the East, in Asia, Africa, &c., till the Saracens prevailed in the latter parts. Second, the Romanesque, the style which, starting from Roman art, was adopted and practised in the West, and which ultimately developed into the Gothic or Pointed style of the Teutonic races. The distinguishing feature of the first is its domical construction and the circular form of its plans; while the latter style chiefly adopted the rectangular plan of the Roman basilica. I allude chiefly to these two great developments of Middle-Age architecture for the purpose of indicating, the relative values of both in our church architecture of the future. While we cannot do better than follow the style and treatment of the latter branch, or the Gothic art of our own country, I think, nevertheless, we may usefully adapt the plans and constructive peculiarities of the Byzantine churches as even more applicable to the requirements of our modern reformed church. But I reserve this point for a future paper in which the more practical aspect of this essay will be considered.

It is to the Romanesque, or Gothic of the West, from which were developed the Pointed styles of the thirteenth and fourteenth centuries, that we must look for the varied elements and expression of Mediæval conception and feeling. Here are harmoniously expressed abstract and conventional forms vieing with the consummate art of the Greeks, after which it must be regarded as the second great period of architectural excellence. Borrowing all that was noble in construction of the arched astylar system of the ancients, the Middle-age architects added variety and vigour, and impressed their own character, thought, and feeling upon the architecture of this period. Comparing the Greek period of excellence with the Mediæval, one reached the acme of material perfection as expressed in the trabeated construction, the other the more varied poetry of arched construction,—one was material wrought out by pure intellect, the other was material wrought upon by the moral and spiritual faculties, under a Divine inspiration. In analysing the characters of the two styles of art, they are perhaps nowhere better expressed than in the mouldings of the two periods. In Greek moulding there is a rectangularity and inflexibility of expression, denoting a decision of thought, and at the same time a delicacy of refinement in the curves that is more indicative of intellect than feeling. In the Gothic mouldings, on the contrary, there is a more playful variety of curves and angles, the latter being oftener obtuse or acute than rectangular, displaying a greater regard for pleasing variety than for decision. The same inflexible rigidity of character noted in the mouldings is also found in the general forms and plans of Greek buildings. The plans of Mediæval structures are, on the other hand, rich in outline, and are, on the whole, exceedingly characteristic of the versatility of the elements and races which combined to form Middle-age society. I think the styles known as the First and Second Pointed, or the "Early English" and "Decorated" of Rickman's nomenclature, express most completely the intellect, spirit, and feeling of the Middle Ages, and are the purest architectural embodiments of this period, but the numerous examples and works render it unnecessary in this essay to particularize the peculiarities of a style so well understood by the readers of the BUILDING NEWS.

---

* *Vide* the painted glass.

From the fourteenth century we begin to trace the approaching disorganisation of Catholicism, or that theological system that had so long held dominion. The decomposition of the system was, then, brought about by its very elements. Thus the metaphysical spirit, or reason, became too critical and powerful for the theological spirit; while a severance was commenced between the spiritual and temporal powers. Hitherto they had subsisted together under a philosophy, but this could no longer preside over both. An inevitable dissolution became imminent between sacerdotal authority and political existence, while the gradual increase of an industrial and scientific spirit made it still more necessary. Comte observes that at this period four evolutions began to characterise society—the industrial, æsthetic, scientific, and philosophical—elements destined simultaneously to prepare a spiritual reorganisation of society. Now, it may appear strange that in all preceding periods the fine arts (Greek perhaps excepted) were essentially confined to the higher classes, but it was so, and the fact only illustrates the basis upon which the arts reposed. Slavery and war were generally the state of society. But at this particular epoch industrial progress gave an impulse to art—at least served to popularise it, by its tendency to develope among the lowest classes habits of mental activity under which alone the æsthetic action can be understood, and also a sense of ease and security so necessary for the enjoyment of art. But at this very epoch, early in the fifteenth century, the decomposition of the theological and progressive elements of society commenced, a revolutionary state of society set in, and the industrial spirit, engaged upon more preliminary and provisional work, rendered little aid to æsthetic action, which was thus deprived of direction or social destination. The history of art for the last five hundred years sufficiently indicates this revolution in the moral and intellectual world, an analysis of which I will show in the next paper. G. H. G.

FRENCH SUBURBAN VILLAS.[*]

(*Concluded from page* 114.)

RETURNING from this long digression to our villa, we find that it is faced in about equal proportions with brick and stone, the broad surface of the former beneath the main cornice being relieved with diamond bands of a darker coloured brick. It would have united the turrets more thoroughly with the general design if the brickwork here had been carried round the turrets, as it is on the lower stage of the front; but I presume the wish of the designer has been to make the corner towers as handsome and presentable as it was possible on account of their prominence. For the same reason the central portion of the façade is of stone.

In the design of the door much taste has been exhibited. The feeling, on the whole, is quite Gothic. Like the later Gothic doors, it is flanked on each side by buttresses square in plan at first and then set anglewise above the sets off, in which form they continue up to the next storey, and are crowned with small elegant carved shafts. It may be urged that these buttresses are mere excrescenses serving no legitimate purpose, and, looking at them in a matter-of-fact way, this is no doubt true. But our art includes imagination as well as reason amongst her clients (a difficult customer to satisfy, by the way), and to meet her views these projections, I maintain, are perfectly legitimate. We instinctively associate the idea of strength to a doorway: and however strong it may really be, if it does not look so and does not boldly assert itself above the rest of the features of the building, it fails to satisfy the imagination.

The head of the door is a depressed arch, very faintly pointed. The architrave mold is somewhat Gothic in character, but projected forward slightly from the wall to secure a definite line of shadow. A label mold surrounds the head, terminating against the buttresses. A very effective billet mold ornaments the architrave, having within it a running band of foliage. The introduction of the female head in the centre of the arch relieves the label mold from the unpleasant effect produced by the depressed point. On each side of this head two mouldings curve upwards, and uniting in the string-course above pierce through it and develope into a finial, of which more hereafter. The spandrels between the arched head and the string are filled with carving, consisting of rich foliage leaves and delicate scroll work. The wood doors are quite in harmony with the light and elegant character of the door-case, the upper parts being glazed between the collonettes or balusters.

The upper part of the façade above the entrance door is a most pleasing composition. The two windows coupled together in one frame, although common-place enough to the idea, display so much taste in the details as almost to reconcile one to the liberty taken with the curved pediment and the sprawling shield in the centre, which, whatever may be thought of it in an æsthetic point of view, quite fulfils the aim of the architect in carrying the eye up, and breaking the rigid lines of the composition. There is, I admit, much here which could not be defended on strict principles of classical architecture; but it would not be fair to judge the design in that way, for, as I observed at the commencement of my remarks, the whole affair is a compromise between the rival styles, and the object in view is, not a Greek villa nor a Gothic castle, but an elegant house, which may appeal to an educated sense of beauty. The finial above the doorway mentioned before is used to attach some ornamental foliage to, in the shape of a large crocket, which spreads itself out on each side, covering the dado under the windows. There is much playfulness and resource shown in this hint taken from the Gothic.

The grande lucarne above these coupled windows may be styled a Gothic dormer, carried out with Italian details. The three finials surmounting it are elegant and well designed. In order to relieve the harshness of the angle formed by the sides of the lucarne and the pediment below, small side buttresses are introduced, which, first sloping slightly outward and then curving at the foot, soften off the upright line into the slope below, and also cover the gap left between the nose of the pediment cornice and the dormer. The window opening is within a slight recess covered with a segmental arch, no doubt intended as an echo to the curved line of the window pediment below.

In the enlarged view of one of the angle turrets the defects of their design come out more prominently. The ornamental shields and oval panels, stuck on like pictures hung on a wall, display a lack of invention and poverty of resource which is strangely at variance with the ability shown in the rest of the building. The architect has more wall space than he knows what to do with—a thing, alas! *we* are rarely troubled with. The object has evidently been to give as much breadth as possible to the towers, but to have left them without anything would have looked bald and desolate, and so he hangs his architectural pictures.

The treatment of the interior features of the villa is Classical throughout, excepting in the grand staircase, where a Mediæval feeling is shown in the carved lion and shield at the foot of the stairs. The upper portion of the stairs is lit from a large skylight in the roof, through an opening in the landing on the first floor.

Leaving this villa, with its spacious grounds, to represent the first of the three classes into which M. Daly divides his houses, we pass to a house situated in the Avenue de l'Imperatrice in Paris, and take it as a sample of the *deuxieme classe.* This villa is well situated, having, in addition to the frontage to the avenue, a front to the Rue de Bellevue, while on the other side it faces some gardens. The entrance is from the side street into a spacious court, having the house on one side and stables on the other. The house is a square block, with a projecting portion at one corner containing the grand stairs. The arrangement is compact and good. Entering the house you first arrive at a corridor which, going straight forward, conducts you to the grand salon, with the petit salon entering from it. To the right of the corridor is the salle à manger, to the left the library. These are all the apartments on this floor except the conservatory, the arrangement of which is worthy of notice. Extending as it does completely along one front of the villa, it serves to unite the apartments together, having large openings leading into it from both the salle à manger and the salon, so that in the case of company the rooms become *en suite* without the inconvenience of folding doors. The situation of the staircase in this example is peculiar, and under the circumstances is, I think, a happy thought on the architect's part. By keeping it clear of the main body of the house he has secured the whole space contained within the four outer walls for his rooms free from interruption. The stable buildings are placed at the back of the land, and form an oblong block with a recess in the centre of the front. The coach-house and stable are at each end, with harness-room and staircase in the centre. The recessing of the front shows thought on the designer's part, as the whole width is not required for the harness-room and stairs he has thrown the space into the court, and by breaking up the elevation of the building has given it greater architectural interest. Passing up to the première étage we find the main corridor as below leading to the master's bedroom, a large room with four large windows. It communicates with the bathroom. To the right of the corridor is the young lady's room, with a large armoire or wardrobe attached, a most useful adjunct for the dresses of a girl of the period, while beyond is the chambre de reception or spare room for guests. Above the stable and coach-house are a number of bedrooms and dressing-rooms for servants. The second-floor contains a spare chamber for guests, rooms for the domestics, and a linen store. In addition to these rooms there is a large billiard-room.

The elevation of the villa, which fronts the avenue, is an elegant example of French-Italian. It is divided into three parts, the middle compartment projecting slightly before the rest, and containing two windows on each stage, while the side divisions have each one window. The grouping of two openings together is never so pleasant as of three, since you get the pier between them in the centre instead of the opening. The number three is an essential to complete beauty in architecture. If we examine an ancient Greek or Roman temple we shall find the principle of three prevailing throughout. Taking first the whole order, we find it to consist of three parts, the entablature, column, and steps. In the entablature we find the cornice, frieze, and architrave; in the column, capital, shaft, and base. Dissecting the cornice we find it consisting of corona, a block or modillion member, and bed mold. In the capital of the column is the abacus, foliage, and neck mold; in the base small and large torus molds and cavetto. You may examine more closely still, and find the same principle prevailing. Take the corona of the cornice, for instance, having still three members, crown mold, small cyma reversa, and the broad surface of the corona proper. This great principle has been derived from Nature, in whose domain it is exhibited in multitudinous forms. In the pyramid, triangle, and ogee the same number prevails. Three was a sacred number with the Greeks, as we have lately been amusingly reminded in an anecdote of Gibson, the sculptor.

Returning to our villa, I would draw attention to the treatment of the centre windows. The details of these are refined and pleasing. Over the centre windows on the ground floor is a projecting balcony, with a light iron balustrade. These balustrades are much used on the Continent, and have this advantage over stone, that they scarcely at all obscure the building behind them from view, and do not dwarf the fronts as more solid ones would do. The whole of the façade shows careful study; the delicate curves of the window heads do not clash with the horizontal lines of the entablature, and being brought close up to them break up their rigidity completely. The elevation to the side street is of the same character as the other. The portion containing the staircase is marked out distinctly from the rest by being built of brick, like the stable building, the small courses of brickwork being much more suited to the smaller features than stone.

---

[*] By W. H. PICTON, A.R.I.B.A. Read before the Liverpool Architectural Society.

Let us pass on now to the third and concluding division of our subject, the *troisieme classe.* I take as an example a house situated in the Rue de la Pompe at Passey. The ground plan contains, large and small drawing-rooms and salle à manger, with the stairs in one corner of the house, so as to interfere as little as may be with the available space. The kitchen and office in the basement has an entrance from the front beneath the flight of steps leading to the front door. On the first floor are three bedrooms and water-closet, to which light and ventilation are obtained from a small area carried up from the level of the first floor. The same arrangements are repeated above on the second floor, the only difference being that the space at the back is made into three bedrooms in place of two. The exterior is neat, but does not exhibit any special marks of taste. A better specimen in this respect is a house of this class by M. Hermant, at Neuilly, which, though somewhat bizarre in character, is pleasing.

In drawing to a conclusion the remarks which have occurred to my mind in examining the buildings brought before you this evening, I fear with much feebleness, I will briefly recapitulate the hints which I think may be derived from them.

1. I would impress upon our student members the great importance of careful planning. The minutest matters become great in the arrangements of a dwelling.

2. In the laying out of land, kitchen gardens and planting grounds should be worked in harmoniously with the general design.

3. There should in every dining-room be a window at the head of the table.

4. Play-rooms and school-rooms for children are better separate from the house in detached buildings, where this can be managed.

5. Hints derived from the Gothic and Classic styles can be successfully combined by careful study.

6. Our great object should be, not so much to act on the principles of any one style as on the general principles of beauty.

7. Our art must satisfy the imagination as well as the reason.

8. A conservatory may be made valuable as a communication between apartments.

9. There is a rule of three in our art as well as in arithmetic, and equally important, as we shall find on examination.

10. The stone balcony and iron balustrade are worthy of imitation and use, to relieve the flatness of our house fronts.

11. Window heads and string-courses may be made mutually to assist each other by an avoidance of harsh contrast and close contact.

Before I close I wish to say a word for the beautiful work from which my illustrations are taken. For the exquisite manner in which the plans and details are got up I have never seen anything to surpass it. The sheets of parallel plans of villas with which it is interspersed are well worthy of study. The dimensions are given on each plan, with separate scales for the elevations and plans. The work consists of several volumes, and may be seen at the Free Public Library.

SOME ACCOUNT OF THE OLD PARISH CHURCH OF SAINT MARY MAJOR'S, EXETER.

THIS church, in order to distinguish it from others of the same dedication, had various adjunct appellations, being called in ancient writings S. Mary Michael, S. Mary the Moor, and S. Mary Major. It was an ancient edifice, but from the style of the building, recently pulled down to make room for a new one of Early English design, it did not appear to be the original religious structure erected on this spot, it being of Norman construction; whereas mention is made of it during the Saxon epoch, it being appropriated for holding the Archdeaconry Court of Exeter, on the removal of the see from Crediton, and the said court is still held in the new edifice. In the year 1222 it is recorded as one of the parish churches then in this city: it was built in the Saxon manner, consisting of a nave only, without any supporting columns, with pointed arched windows. At the east end, through a lofty Gothic arch, it opened into a large chancel, which was of a different construction, and appeared of a more ancient date than the body of the church; it had a separate entrance from the yard, and over the north window was a small tablet representing S. Lawrence in a state of martyrdom on a gridiron; and on the angles of this and the other windows, cherubims supporting gridirons were represented in *basso-relievo.* Opposite the entrance into the chancel was a small vaulted room, sometimes used as a vestry.

The tower, which was situated at the west end of the church, was of singular construction, and had more the appearance of the keep of an ancient castle than of a campanile or bell-tower. It was evidently a Saxon building, and of more ancient date than the church. In its original state it was of greater height than lately; for about the year 1768, a survey being taken of it, the uppermost part was found decayed, and in danger of falling, greatly overhanging the base; therefore 35ft. of it was taken down, and an ill-constructed cupola erected in its place. On the south and west angles were two strong projecting circular staircases, which led to its summit; and the other two angles where strengthened by large buttresses. The original entrance into this building was through a semicircular arched gateway between the projecting staircases, and over it was a large semicircular arch, in the middle of which was a small window; and in the buttress on the north angle was an antique niche or recess, surrounded by a plain band or moulding. For what purpose this recess was intended cannot be conjectured: its situation in the buttress proves it was not designed for a window, neither was there any sign of a statue having ever been placed there. This niche was the only embellishment to be seen in this antique fabric. Nor does history or tradition inform us of the original intent of our ancestors in erecting this massive building, and, therefore, conjecture only can be offered; some are of opinion that it was a pharos, or watch-tower; others that it was a fortification, and the *dernier ressort* of the inhabitants in time of war,* for which its strength in those days seems calculated; but these are opinions only. From the construction of the pointed arch, by which a communication was opened from the tower to the church, it seems the work of some ages after its first building. It had in former ages a lofty spire, but that has been removed for upwards of two centuries; also six bells, five of which were sold (to the great regret of the parishioners) towards defraying the expenses incurred by taking down part of the tower in the year 1768. On a wooden tablet, hung in the angle of one of the windows on the north side of the church (now removed), were painted the arms of Petre: gules on a bend or, a Cornish chough proper, between two cinquefoils azure, between two escalops argent; and underneath the following lines in black letters:—

Twenty churches can reporte
The goodness of the manne
Who bare those arms in his life,
Through virtue he them wanne:
Of customers I think it meet
He ought to have best prayse
John Petre,† so he knowe his name,
He died by Exe, at Hayes,
Who by his will and testamente,
The Lord be praysed therefore,
Gave twenty pounds, in yearly rente,
To the poore for evermore:
So that the poore should have some part
Which he was blessed withalle,
God give us grace to do the lyke
When hee us hence shall calle.

BUILDING NEWS SKETCH BOOK.

XL.—OLD HOUSE AT THORPE, PETERBOROUGH.

THE subject for our sketch book this week is an old house in the parish of Thorpe, about one mile and a half from Peterborough, now in the occupation of Mr. James Warwick as a farmhouse. As will be seen, the tower is much the oldest portion. It is square on plan, with walls about 7ft. or 8ft. thick, and the two lower stages are both groined over, the stone ribs of which and the moulded angle corbels being apparently as clear and fresh as on the day they were first put up. The upper stage is reached by a narrow and very steep stone stair, and here there are several very curious nooks and corners; it is covered with an open pyramidal roof covered with stone tiles. From enquiries made in the short time I had at my disposal I was not able to learn the name or original use of the building, but it is said to be part only of a much larger building which originally had four of these towers.

There are several other very interesting old houses in the village of a later date, and between it and Peterborough is passed a grand old Italian mansion, said to be by Inigo Jones (at Thorpe Park). The church also is interesting. Though small, it is simple and good; the windows are two-light cusped lancets, not unlike the single-light window in sketch, and possibly originally formed part of this building. These buildings would well repay a visit from any students in architecture who might have a day or two at their disposal, as they are very accessible from town, there being so many express trains to and from Peterborough.

John Ladds.

OLD OAK CABINET.

THE ancient oak cabinet of which we give an illustration is a very good example of old English furniture. The date is probably late Elizabeth or early James I. The lower panels are particularly worthy of note, and the mouldings are throughout very delicate. Some of the ornament, on the other hand, may be considered somewhat rude, but if wanting in the machine-like accuracy of modern work, it has a vigour and freedom which we look for in vain in the tame and spiritless productions of the present day. The ornament on the frieze, for instance, is not even spaced out equally, but if it were the general effect would probably not be improved. The inlaid work round the upper doors is composed of pieces of black and yellow wood, apparently bog-oak and box. The carved side of the cabinet is the one shown on the drawing, the other side being plain panelling; from which it appears to have been designed for some particular situation.

With so many excellent specimens of furniture of the 16th and 17th centuries still remaining, it is unfortunate that modern designers of furniture should draw so largely on their own poor powers of invention, for the comparison between ancient and modern work is anything but favourable to the latter.

The only portion of the cabinet which is not old work is the moulded cornice, which has been lately added, the original one being gone.

J. H. M.

LONDON WATER.

PROFESSOR FRANKLAND, in his report to the Registrar-General on the quality of the metropolitan water supply during the month of July, states that all the waters delivered in London were clear and transparent, except that of the East London Company, which contained brown particles and filaments among which living organisms were observed. Dr. Frankland makes two suggestions of great importance in a sanitary point of view. He points out that the patent for Clark's softening process having expired, all water companies are free to avail themselves of this simple method of reducing the hardness of water and removing from it a large proportion of organic impurities. It would not be an undue return for their monopoly of the supply (as a medical contemporary observes) if the London water companies were in future to apply Clark's process to all the water delivered by them for the public use. Dr. Frankland insists also on the good quality for bathing purposes of the Thames, as it passes through London, after its water has been filtered through sand. "The river current," in his opinion, "would afford power for effecting this filtration, and public floating baths established on the Thames, through which a constant current of filtered water was made to pass, would be much superior, both as regards convenience and purity of water, to the best bathing attainable in the Serpentine." The establishment of swimming schools for both sexes on the Thames would put an end to the unfavourable comparisons between London and some other cities of Europe as regards this valuable adjunct to public hygiene.

---

* See Judges, chap. ix., v. 51.—"But there was a strong tower within the city, and thither fled all the men and women, and all they of the city, and shut it to them, and gat them up to the top of the tower."

† This John Petre was sometime the King's Customer for this port; he, by his will, dated 1579, left £20 per annum, issuing out of the sheaf of Cornworthy, in the county of Devon, to twenty different parishes (of which this was one) for the preferment of poor maids in marriage.

Furniture & Decoration.

THE THEORY AND PRACTICE OF MODERN HOUSE PAINTING AND DECORATION.

By AN EXPERIENCED WORKMAN.

PREPARATORY PROCESSES.

(Continued from page 120.)

IN order to produce good work in the painting of walls and plaster work generally, it is necessary to use a wise discrimination, and to observe certain rules both in the mixing of the paints for use and in using them after they are mixed. As we have before observed, there is a great difference in the absorbent powers of certain cements and ordinary plastered walls, and there is just as much difference between the absorbent powers of the ornamental castings in plaster of Paris and ordinary plaster work, or, indeed, of any work which is finished with the trowel. Plaster casts are of a very thirsty nature, and will absorb a very large quantity of either oil or water, and if there is too much white lead in the paint with which these castings are first painted they are apt to clog or fill up; consequently, they should be painted the first time with colour having more oil in it than that used for the walls. This is the more necessary as its neglect often spoils the sharpness of the finer parts of the ornamental work. There is also another advantage in using the first coat of paint thin—*i.e.*, it sinks further into the body of the plaster, and in time forms an exceedingly hard and firm surface, which serves as a protection to the work. Many painters make a practice of giving the walls a coat of clearcole, or glue-size, before painting, in order to fill up the pores or to prevent the suction of the plaster; and also between the two last coats, in order to cause the work to bear out or present one uniform surface, so that the omission of one or two coats of paint may not be observed when the job is finished. We cannot find words strong enough to condemn this practice; in the first place on the score of its dishonesty—for we know it to be a common practice for painters to contract to give work three, four, or five coats of paint, and, instead of fulfilling their contract honestly, they give the work one or two coats of size instead of the same number of coats of paint, and thus commit a decided robbery. With these men an honest man has no chance in contracting for work; furthermore, the demoralising effects of such practices upon the workman cannot be calculated. An old proverb says that practice is better than precept; in this case it is not so, for there is no precept which inculcates dishonesty, and this practice does teach dishonesty. Putting this aside, we object to the practice altogether, because of its liability to cause the paint to crack and peel off. Under certain conditions we have seen the paint shell off in large blisters and in sheets, solely because size has been used; and it may be laid down as a rule that glue-size used upon paint is in all cases employed either to save labour or material, and that there is no case where it can be used with advantage to the work. It may sometimes be *expedient* to use it, but it is better in all cases to do without it. In laying on the paint, care must be taken that it is laid on evenly and without showing the marks of the brush. This is quite as necessary with the first coat as with the last, for if carelessly or badly painted in the first coat, much after labour will be required to rectify it, and in many cases it will remain an irremediable defect. If care is taken to avoid this fault, a deal of trouble will be saved, and the work will be better at the finish. Unfortunately, carelessness in this respect is the rule, and carefulness the exception, the painter often trusting too much to the subsequent coats of paint to cure an evil which, by common care, might] be avoided at the beginning. The paint should be laid on and well crossed, and when it is laid quite equally, with no more in one place than in another, it should be laid off softly, and not with the full weight of the brush. By this means the work will present an even surface, free from the marks of the brush; but if much pressure is used the work will be streaky, and the paint will stand in ridges. This is a very common but a very serious defect, and always spoils the work on which it appears, and, therefore, pains should be taken to avoid it as much as possible. A good plan to attain this desirable object is to use a partially-worn flat or stock brush, or a two-knot copper-bound brush, for laying-off with. We thus lay-off a wider space at one stroke, and are less liable to leave an uneven surface. The second coat on walls should be mixed with about two-thirds oil to one-third turpentine, in the proportion of 5lb. of lead to one pint of thinners, this coat requiring a greater body of lead in it than the first coat. The same care should be bestowed in laying it on the walls as before; but previously to commencing to lay on the second coat the walls should be rubbed down with fine sandpaper in order to remove any nitts or grit, and all places which may have been overlooked in the first stopping should now be faced up with hard stopping, great care being taken that the places stopped do not stand up above the face of the surrounding level. The third coat should be a mixture of two-thirds turps to one of oil, keeping about the same proportions of lead to thinners (*i.e.*, oil and turpentine) as named above. It must be observed here that the more turpentine there is in the colour the quicker it will have to be worked, as the turpentine evaporates so quickly that the paint sets or gets stiff very soon, consequently it is best to paint a strip of the wall at once about 16in. or 18in. wide, from top to bottom of the wall. By this means the whole is kept sweet or wet together. The last strip may be laid off into the edge of the one preceding. We thus get a perfectly level and uniform surface, but if too much space is painted in at one stretch the edge of the preceding one is apt to set before it can all be laid off, and so the work will show a mark or "piecing" between each strip. The fourth coat will require to be painted with gloss or oil colour. We may here explain that gloss colour upon gloss colour does not work well, the last coat being apt to "cess" or contract, so that in order to make firm solid work it is necessary to manipulate the successive coats of paint part dead and part gloss colour; and in the painting of the last coat before flatting it is absolutely necessary that it should be gloss colour, in order to form a key to bind the flatting, because the flatting, being mixed with turpentine alone, has no binding qualities in itself, except the small portion of oil which the lead itself contains, and even this must be removed as much as possible to make good flatting. The wall should be painted with oil colour one day, and flatted the next day following. If this is not done the oil colour gets hard and loses its key or "tack," and the consequence is that the flatting is not bound fast, and will wipe off with the slightest touch, and will not wear any length of time. It is a common complaint with housekeepers that the dead colours do not wear well. The sole cause will be found to be as above stated, and of course can always be avoided. If the work is properly done the flatting softens the face of the oil colour, and the two form one homogeneous whole, and will get almost as firm in time as oil colour. The fifth coat (under which number of coats no new walls can be properly finished), if it is to be flat colour, will require to contain a greater proportion of lead than the previous coats, as turpentine will hold in solution a much greater quantity of lead than oil does, and yet work thinner. There are several points to be carefully observed in order to produce good flatted work. What we have before said as to getting the work quickly done is especially applicable to flatting. If it is a good job it will appear of one uniform surface, free from shades or half-glossy parts, and this can only be attained by great care in the working. The flatting colour is best mixed ten or twelve hours before it is used. The oil contained in the lead rises to the surface, and may be poured off, which will assist the colour to dry much freer from gloss than if the oil were not removed. The paint may now be thinned to a working consistency with pure turps.

(To be continued.)

THE ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETY OF DURHAM AND NORTHUMBERLAND.

THE third general meeting of this society was held on Tuesday, August 2nd, at Aycliffe, Heighington, and Walworth Castle. Members assembled at Aycliffe Church about half-past ten a.m., when the Rev. J. F. Hodgson read a paper on the history of the place, originally known as Acle or Aclea, and its supposed connection with the Saxon synods held in the years 782 and 789, but the exact locality of which a very preponderating weight of evidence serves to fix in the kingdom of Mercia. He then passed on to a critical examination of the architecture of the church, and the several peculiarities presented by it. Though plain and simple, the building, notwithstanding much modern mutilation, is a very interesting one, showing distinct evidence of progressive alteration and development from the time of its erection in the latter part of the twelfth century to the close probably of the fifteenth. On the conclusion of the paper, the two very ancient and richly-sculptured Saxon crosses standing in the churchyard were carefully investigated, when the president, the Rev. W. Greenwell, delivered an elaborate discourse on them and other kindred works of that remote period, taking in connection with them a comprehensive view of the whole subject of Celtic decoration, as witnessed by the several remains which have come down to us from some thousands of years before Christ, through the period of the Roman empire, and that which followed its decline. Leaving Aycliffe the party proceeded to the neighbouring village of Heighington, the church of which, probably the most perfectly-preserved example of the Norman period in the whole diocese, was carefully examined and described by Mr. Hodgson. With the exception of the south aisle, an addition of late thirteenth or early fourteenth century date, the whole structure is of one period, *circa* A.D. 1155-60, and built at a single effort. Perhaps the most remarkable feature is the chancel, which is in two nearly equal transverse divisions. The eastern one—considerably the narrower—forms a structural sanctuary very strongly defined—the western, the chancel proper, or *chorus cantorum*. The chancel and tower arches are well moulded and perfectly preserved; the latter, however, is at present entirely concealed by a modern partition wall, which shuts off the tower from the body of of the church. The old Norman doorway, of imposing aspect, but somewhat singular decoration, is now blocked up. A modern one has been broken out in the tower, thus practically converted into a porch; the loss of room which the church has thereby sustained being made up for by the erection of galleries. In the tower are three ancient bells of remarkable excellence, and perfectly preserved. They all bear incriptions; two of them in characters of the thirteenth century, the other in black letter. In respect of shape, beauty of decoration, and excellence of tone, these bells are quite unrivalled in the North. Walworth Castle was reached between two and three o'clock, where the members were met and most courteously entertained by the family of Mr. Masterman. Mr. Longstaffe then gave a full account of the ancient owners, and of the once adjoining, but now destroyed, village. This was followed, at the president's request, by an architectural account of the castle, from Mr. Hodgson. The Decorated village church or chapel, now used as a barn and cow byer, was then visited. It is very small and simple, but on the whole tolerably well preserved. The few remaining details show it to have been erected during the last quarter of the twelfth century, *circa* A.D. 1180. The wooden door, with its ancient closing ring of wrought iron, remains in the neighbouring farmhouse. Having now accomplished all the objects of the day, and bade farewell to their kind entertainers, the members dispersed on their several ways about five o'clock—the president, with some others, to make an inspection by the way of certain ancient relics discovered during the late restoration of S. Cuthbert's Church, Darlington, with a view to their transference to the museum of similar antiquities now being formed in the library of the Dean and Chapter at Durham. The next meeting of the society will be held about the end of the present month, or early in September, at Rievaulx and Byland Abbeys, including the churches of Thirsk, Helmsley, Coxwold, &c.

◆

NEWCASTLE-ON-TYNE.

TOWARDS the end of the last century, Newcastle extended little beyond the ancient and strong walls with which it was surrounded, and in 1801 it contained, we believe, only 28,000 inhabitants. The banks of the Tyne, now resounding with the industry of thousands of workmen, were then a pleasant stroll for the worthy burgesses. Dr. Charlton, in his inaugural address last week as president of the British Medical Association, briefly sketched the rise of the town, and after referring to the place as having formerly been one of the great strongholds of the North, he remarked that for centuries after border warfare had ceased it remained subject to all the inconveniences of a fortress. Hence arose the narrow streets and overhanging dwelling-houses of the Tudor and Elizabethan periods, some of which may yet be seen in the neighbourhood of the river and within the precincts of the ancient walls. Still, in the centre of all this crowding, there was a fine open space of five acres, the very lungs of the old town, and which remained untouched till about thirty-five years ago, when it was purchased by an enterprizing speculator, who covered with huge buildings the whole of the vacant space, which is now occupied by Grey-street, Grainger-street, and the markets. About the same time trade increased rapidly upon the Tyne, manufactories sprang up on each side of the stream, new branches of industry were developed, and the old parts of the town became fearfully overcrowded. Unfortunately, while house accommodation was thus deficient, the water supply did not keep pace with the increase of population. It may now be said, with almost perfect truth, that Newcastle and Shields form but one continued town, for within the last twenty years almost every rood of the banks of the Tyne, from Newcastle Bridge to the sea, has been occupied by manufactories. From its position on the shore of a tidal stream, and from the steep incline on each side affording good facilities for drainage, from its now fair supply of water (from reservoirs twelve miles from the town and free from all danger of contamination), and from its proximity to the sea, Newcastle ought to be a healthy town, and to present a low rate of mortality. The death rate of late years has, however, been comparatively high, owing to visitations of epidemics, which have rapidly spread, owing to the over-crowded state of the smaller tenements of the town.

◆

SUFFOLK INSTITUTE OF ARCHÆOLOGY

THE annual excursion of this society took place on Thursday week, the *rendezvous* being Halesworth.

The first place visited was Halesworth Church, where the party was met by the vicar, the Rev. V. J. Stanton, and Mr. R. W. Burleigh, who pointed out the various objects of interest. The church is built in the Perpendicular style. Within the last few years an aisle has been added on each side, which gives great breadth and spaciousness to the building. The principal points of interest were some brasses dredged up from the river Waveney, near the "Roaring Arch," in 1825, which were found to have been taken from this church, and which fell into the hands of the Rev. S. B. Turner, and were by him restored. In the restoration of the church afterwards the stones from which they were taken and the matrices plainly belonging to these brasses were found, and the whole are now placed on the east wall of the south aisle. Mr. Burleigh showed a sacramental book kept by the Rev. John Argall, who was vicar of Halesworth from 1580 to 1610, and there were several curious items among the entries. The font is beautifully carved, and remarkable for its enriched work. At the east end of the church is some very fine flint work; as also at the entrance to the aisles, where there are some good canopied niches in the buttresses. A few years ago the church was thoroughly repaired and restored, and it is now one of the finest churches in the county.

Holton Church was the next place visited, the party being met by the incumbent, the Rev. R. S. Beloe. The church, prettily situated on the border of Mr. A. Johnston's park, has a round tower, and is principally new, but the style of the older portions is Late Norman. The roof is now tiled, but there are marks on the tower which show that it was originally thatched.

Westhall Church had many points of interest to the archæologists. It appears originally to have been a chapel to West Hall, but when West Hall became a parish it was enlarged, and a tower built in front of the fine Norman doorway, which it is conjectured was the original entrance to the church, and above which is an arcade which is supposed to have been windows. There is an altar tomb, erected by Francis Bohun to the memory of his son, who married Audrey Coke, sister to Lord Chief Justice Sir Edward Coke. The octagonal font is worthy of notice, as showing remains of painted sculpture, representing on seven panels the seven sacraments of the Romish Church. On the remaining panel is what is supposed to be the baptism of our Lord.

A long and pleasant drive through country roads brought the party to Reydon Church, a plain building apparently belonging to the Perpendicular style.

The excursionists then proceeded to Southwold, where they visited what is said to be one of the finest if not the finest church in the county, and which certainly has many objects of interest to the archæologist. It is dedicated to the martyr-king, S. Edmund, and is a splendid specimen of the Perpendicular style, the tower being especially fine, though the parapet has never been finished. The roof of the chancel is painted to represent the stars in the firmament. Among many other objects of interest in the church must be mentioned the figure of a man in armour, which stands above the vestry door, and with his battle-axe strikes a bell before him as the clergyman comes into church to service. Mr. R. M. Phipson kindly undertook to point out the main points of interest, and the Rev. W. Sewell gave a description of the rood-screen.

The party then went to the Lecture Hall, where a capital little museum had been arranged by Dr. Blackett. Among various articles may be mentioned a parchment roll, of extraordinary length, containing the list of bailiffs and mayors of Norwich from 1403 to 1737, exhibited by Mrs. Rayley; also "One-third Part of the Bible, containing some excellent books," with the Church of England Liturgy, printed in 1638, with a book of hymns printed at about the same date, all of which were the property of Mrs. Rayley. There was also an ancient violin, made of iron, which was found near Battle Abbey, Sussex, and was exhibited by the Rev. R. F. Whistler, together with a collection of ancient coins, the head of a battle-axe, and a very old padlock and key used at Battle Abbey. There were cannon balls dredged up from the bay, having been deposited there at the renowned "Sole Bay fight" between the English and French and Dutch fleets. A sketch was shown of the stones found at Mutford Wood, near Lowestoft, and an old knife; some bones and other things found near them were also shown. Two charters granted to Southwold, a large number of polished pebbles picked up from Southwold beach, and a variety of other things, were included in the collection, and great thanks are due to Dr. Blackett for his trouble in getting it up.

Blythburgh Church, the next visited, was once a very fine edifice, but is now almost a ruin. It is in the Perpendicular style, and its size seems to point to the fact that Blythburgh was once an important town. The party were here met by the Rev. J. J. Raven, who had prepared a paper upon the church and priory. The priory was first visited, and Mr. Raven, having mounted a portion of the ruins, read a long and interesting paper. Mr. Truman, a resident in Blythburgh for the last fifty years, pointed out the place where the arch fell in 1863, and a part of a stone coffin which had been found, together with other matters of interest. The company then walked to the church, where Mr. Raven continued his paper. Entering the church, Mr. Raven drew attention to the roof, which is depressed, and there is no division between chancel and nave.

The next stoppage was at the little church at Thorington, which is one of those with a circular tower, round which is an arcade of shallow panel work. Bramfield Church was the last visited, and has a peculiarity in the fact that it has a round tower, which stands detached from the church. The reason for this has been discussed, and the most probable seems to be that the church was originally built without a tower, and that afterwards, wishing to have one, but not wishing to block up the west window, the tower was built away from it.

The company then returned to Halesworth, which town was reached shortly before seven o'clock.

◆

SAVE OUR FOREST TREES.

WE welcome a protest against the destruction of the New Forest, on the ground that "trees are the great retainers of moisture," and that the droughts of late years are to some extent the result of the great decrease of trees on the surface of our country. The French Government, having similarly suffered, are planting afresh in all directions in order to supply the loss of trees which have occurred since the Revolution, the land having been largely cleared and the forests cut down. Is it wise on our part (asks the *Globe*) to cut down the New Forest, a reservoir of moisture whose value is heightened by the fact that no hills of any magnitude are found in the district? You cannot replace those mighty trees; if once the area of the forest is cut into agricultural parallelograms its ancient character can never be reproduced. It is a short-sighted policy which would cut down a five-hundred-years'-old oak, which has brought down myriads of rain clouds, in order to find room for half a rood of potatoes. Everywhere trees are disappearing from the hedgerows, while the reckless unscientific drainage of modern times is lessening the supply of springs and making drought inevitable whenever the summer is rainless. In fact, our agriculturists are doing their utmost to reduce England to the condition of Egypt, forgetting that neither Thames nor Severn is a Nile, fed by mysterious highland lakes and inundating the country every year. The New Forest, like Epping Forest, is Crown property, therefore the officers of the Crown should be the last to render it useless, or comparatively so, to the nation. We are told that "by the enclosure of commons 540,358 acres have been taken in since 1848. Of these only 3,746 have been allotted to recreation grounds and gardens for the labouring poor." If this be true, how great a fraud has been committed on the people!

◆

THE VENTILATING OF CELLARS.

MUCH has been said, says the *Technologist*, about the necessity of rendering the basement and cellars of houses sweet and wholesome; but although this subject, which so intimately concerns our sanitary economy, has been before the public for years that need not now be counted, little progress has been made in attaining the wished-for end.

The cellar of a house may fairly be likened to the lower hold of a floating ship—the one being below ground, the other sunk in the water, and a like difficulty attends the ventilation of both—namely, the expulsion or extraction of foul air, to be replaced by that which is pure, or as nearly pure as circumstances will admit. The first thought is that of the extraction of the foul air, and it is one which has a claim upon science that has scarcely received that attention it deserves, although common sense ought to teach us that health depends upon it. Cellars are not always ceiled, and, even when they are, it is in such a coarse manner that the defence thus made against rising exhalations and the effect of a damp atmosphere upon the floor above must be very slight indeed, so porous is this rough coating of plaster. Some persons fancy that to flag or cement the cellar floor and walls is a preventive of noxious gases forming there. But this is a fallacy. It is true that such a treatment makes the cellar dry (provided the under drainage be perfect), and, to that extent, improves the atmosphere, yet still it has that death-chill to be found in the subterranean tomb where decomposition reigns, and where, notwithstanding the stone surface surroundings and cemented brick arches, damp settles and foul air is the only atmosphere. The lower hold of a ship is subject to a similar state of noxious air settlement, but both of those have a less influence for mischief upon human existence than has the cellar under the dwelling house, for the tenants of the latter are experiencing the injurious effects for a lifetime, whilst the passengers and crew of a ship have a limit of a voyage to their experience, and the tenants of the tomb are past its influence. Now, if ship fever and many other malignant outbreaks of disease may be traced to this source, even during the comparatively short duration of a sea-voyage, how much more to be dreaded and guarded against is the permanent evil arising from the presence of such a Pandora's box beneath our very feet and sending up its subtle influences to undermine our existence?

As we have already intimated, the difficulty in remedying this necessary evil of cellars lies in the perfect expulsion or extraction of the stagnant fœtid atmosphere, and this can be effected by either revolving fans exhausting a flue or flues (either vertical or oblique), or by forcing-pumps propelling fresh external air into, and thereby driving the foul air out of the cellar. There are other means, however, which we will suggest as eminently fitted for this purpose, always keeping in view the one great principle which governs, or seems to govern, society—economy. The chimney being the indispensable feature of every house, the use of it as a means of ventilation is ever present. And, as heat is a conductor which can thus be easily made available, we have at once a solution of the problem of extraction in the simple addition of a continuous flue from cellar to chimney top, which may also have one of the simplest of the patent revolving ventilators now in use attached to it. As an aid to this vertical ventilating flue, we would have another flue for the reception of external fresh air at the ground level, which would supply the place of the retreating foul air, and thus maintain a wholesome current, or, at least, a constant change of atmosphere. In order to build the chimneys to suit this principle of ventilation, it is only necessary to construct two flues 4in. square, one at either side of the fireplaces, and occupying a position in the chimney breast nearest the fireplace. The object in having two of these 4in. flues is to balance each other, and, at the same time, to give in the second one a very desirable servant in any household—namely, an ash-shoot, through an iron trap in which, located on a level with the hearth, the embers, dust, and ashes may be cleanly swept and be instantly precipitated to a receiver or close dust-bin in the cellar. It would be very desirable to have both of these flues made circular, which could easily be effected by the mason using an open tin cylinder, with a handle at the upper end by which he could draw it up as he proceeded with his work. Around this cylinder he should plaster close with lime and cement, in equal proportions, against three times as much sand. Of course, the flues may be square, or even oblong, but, of whatever shape they may be, it is absolutely necessary that they be carefully pargetted or lined with plaster. This, in the one flue, prevents the lodgment of ashes on projections, the accumulation of which might eventually choke up the passage and destroy the efficiency of this useful labour-saver, and, in the other, gives a freer passage to the ventilating draft.

A more expensive, but far more perfect, method of ventilating cellars would be to ceil over the whole space, and place ventilating thimbles at intervals between the joists. In this way the spaces between joists may be made to act as air tunnels, having grated openings in the external walls. In fact, there is no good reason for not so utilizing these joist spaces. In order to thoroughly purify the atmosphere of these underground rooms called cellars, where a stream of water from a spring is available, a cemented drain, open on top, is excellent for the purpose, the current carrying off all mephitic gases and creating ozone, the purest of atmospheres. Where a running stream from a pure spring cannot be had, its place may be partially supplied by the use of the hydrant at one end and a small pump at the other, thus letting the water in from the street in a continuous stream, running through the cement channel already spoken of, and drawing it off at the other end, unless the sewer be below the bottom of the cellar, in which case the pump is not needed. This artificial flow of water should take place twice each day—in the evening to cool the atmosphere after the sodden effects of the day, and in the morning to clear off the exhalations of the past night. Have as many windows as possible and at as many sides as practicable, and let them be removable. There should always be an outer door, reaching to the very bottom of the cellar, and it, and the trap outside, should be opened as often as possible for the admission of air.

We cannot dwell too much or too long on this subject of ventilating cellars, for the neglect of such a practice endangers the health of a household. Every moderate dwelling has an inside cellar stairs with one door only, and that opens directly either into the living room or the kitchen, so that if decaying vegetable or noxious refuse be there and ventilation be wanting, this door becomes a valve, through which, when open, the poisonous atmosphere escapes into the upper part of the house to generate disease, and who can say how many lives have been shortened through this one means alone?

The cellars of our houses are too much neglected because they are out of sight, and yet much of the food we eat is stowed away there. Is it consistent with cleanliness, nay, with common sense, that such a state of things should be permitted to exist in any community where health is prized and long life looked for?

SCHOOLS OF ART.

Bridport.—The Bridport School of Art was opened on Monday week, after the summer vacation, when a public meeting for the distribution of prizes was held in the lecture-room of the Literary and Scientific Institute. The Rev. R. L. Carpenter, the secretary, reviewed the position of the schools with regard to the Government prizes, comparing the results with those of other schools, by which it appears that Bridport this year has been very successful. We may here state that the pupils of the schools have just presented Mr. D. Campbell, the master, with a handsome gold watch, in recognition of the zealous and painstaking manner in which he has discharged his duties.

Dover.—The opening meeting of the Dover School of Art took place on Monday evening. The rooms selected for the business of the school are two belonging to the Old Ship Hotel, which have now been completely transformed into a school of art. Models of every sort are arranged around the walls, and some very good statues for anatomical drawings have been obtained. The Mayor occupied the chair, and was supported by Richard Redgrave, Esq., R.A., and Major Dickson, M.P.

ARCHÆOLOGICAL.

Sussex Archæological Society.—The annual meeting of the Sussex Archæological Society took place on Thursday week at Rye. The attendance was not large, partly owing to the fact that the district had already been visited by the Society. The majority of the company came by special train from Brighton, and on arriving at Rye were met by Mr. George S. Butler, F.S.A., and the Rye Committee (headed by Alderman Judge, the mayor of the borough), and conducted at once to the Town Hall, where a museum of local antiquities was exhibited, Mr. Butler pointing out the principal features of interest. On leaving the Town Hall the company visited the parish church, a fine old structure, and various other places of interest in the neighbourhood, and afterwards partook of luncheon in the Assembly Rooms of the George Hotel. Ninety-four ladies and gentlemen sat down, presided over by Mr. J. G. Dodson, M.P.

Another Roman Altar Found.—The monthly meeting of the members of the Newcastle Society of Antiquaries was held on Wednesday fortnight in the Old Castle—Dr. Bruce presiding. The chairman said that, in addition to the altars found at Maryport, another one had been found, and it had this peculiarity about it—it was dedicated to the god Vulcan, and no other altar in Britain had been found dedicated to that deity. It had likewise this peculiarity, that the name of the god, instead of occurring first, as was usually the case, occurred last, the name of the dedicator being first. Another stone had been found, but not inscribed, having a mark very like a broad arrow on it.

Pictish Castles, or "Brochs."—The locality of the circular towers known as Pictish castles, or "brochs," has, till lately (says a Scottish paper), been supposed to be confined to the northern counties and islands of Scotland. The excavations just completed in the ruins on Cockburn Law established the existence of a genuine "broch" on the Lammermoor; but till now this is the only specimen between Ross-shire and the Borders of which the character has been clearly proved. The "broch" is a circular tower, with walls of great thickness, in which are ranged a series of vaulted chambers, sometimes connected by stone steps with upper galleries, and at others having narrow passages which open into the central area.

Building Intelligence.

CHURCHES AND CHAPELS.

Bedfield, Suffolk.—The chancel of Bedfield Church, near Framlingham, has been re-opened, after having been reseated and restored. A new roof of stained deal with curved ribs has been put up, covered with old tiles. The new seating is of oak, with carved stall elbows, and the floor paved with tiles in pattern. The new reredos is of Caen stone, with carved spandrels containing the lily, passion-flower, trefoil, oak, &c., and the panels, which are of slate, filled in with a painted and gilded floriated cross in the centre on a blue diapered ground, with emblems of the Trinity and texts on each side. The side panels contain the Lord's Prayer, Decalogue, and Belief in ornamental writing. Below the panelling the reredos is lined with glazed tiles in colours. The altar rail is, of oak, supported on iron scrolled and foliated standards. The work has been executed by Messrs. Vine & Day, builders, of Eye, and the decoration by Messrs. J. & J. King, of Norwich, under the superintendence of the architect, Mr. James K. Colling, of Hampstead-road, London.

Bohernabreena.—The new (Roman) Catholic church of S. Anne, Bohernabreena, Co. Dublin, has just been dedicated by the Bishop of Grahamstown, South Africa. The designs for the new building were furnished by Mr. J. J. M'Carthy, F.R.I.A.I. The style is French Gothic of the thirteenth century. It consists of nave and chancel with semicircular apse, north and south transepts with side chapels. It is lighted by five two-light tracery windows. The west end has a triplet of lancets and a Catherine-wheel window above. The roof is open-timbered, stained and varnished. The material used in the exterior is granite, finely chiselled.

Brighton.—The Earl of Shaftesbury on Monday last laid the foundation stone of the new chapel for the Countess of Huntingdon's Connexion in Brighton. The new chapel, which will be Early Decorated in style, is being erected on the site of the old building in North-street. It will have a handsome frontage, and be surmounted by a spire. The main entrance, in North street, will be by a triple archway, supported by columns, over which will be two windows, surmounted by a rich rose or wheel window. The south wall will be pierced by three windows, of which the central one—the "Sortain Memorial Window"—will have five lights. A light ornamental gallery will run along each side of the building. The chapel will measure 100ft. long, 40ft. wide, and 41ft. high, and accommodation will be provided for nearly 1,000 persons. The spire will be 112ft. high. Mr. J. Wimble, of London, is the architect, and Messrs. Myers & Sons, of London, are the builders. The total cost will be about £5,000.

Durham Cathedral.—The operations which have been going on for some time past in the way of removing the coating of whitewash from off the walls of the north aisle of the cathedral have now been completed. The improvements thus made have met with approval in the town, and the general feeling is that the work should be continued throughout the whole of the edifice. Whether this will be done is not yet known, but it is more than probable that, on the completion of the changes now pending, the Dean and Chapter will be in a position to give orders to the above effect.

Hopton Castle.—The parish church of S. Mary, Hopton Castle, Herefordshire, was re-opened for Divine service after complete re-building on Thursday week. It consists of nave, chancel, south porch, vestry, and sacristry, and there is a double bell-cote over the west gable in which the old bells are re-hung. The edifice is of stone, with open timber roof of pitch pine boarded inside, and the rest of the woodwork, including chancel stalls, and the seats throughout the church, are of the same material. The work has been carried out by T. Gough, contractor, Bishop's Castle, from designs by Mr. T. Nicholson, F.I.B.A., of Hereford, the diocesan architect.

Ludlow.—The foundation stone of a new Primitive Methodist Chapel was laid at Ludlow on Wednesday week. Mr. W. Russell is the builder, and Mr. J. Grosvenor the architect. The structure is to be of red brick, with white brick dressings, and in the Norman style of architecture. The interior will afford accommodation for more than 600 worshippers. Its estimated cost is £1,700.

Mole Brace, near Shrewsbury.—The ceremony of opening the tower of the parish church took place on the 11th inst. The tower, which is 25ft. 6in. wide, exclusive of buttresses, and about 100ft. to the highest point, is battlemented, and consists of four stages; in the upper stage are hung three bells, by Mears & Co., the framing for three more being provided. Since the consecration of the church in May, 1869, an alabaster reredos, by Earp, has been presented. The central subject is the resurrection of our Lord; on either side are niches containing figures of S. Thomas and S. Mary Magdalene. The north-east window of the apse has also been filled with painted glass; it contains nine panels, representing the Temptation, the Expulsion, the Sacrifice of Cain and Abel, the Finding of Moses, the Burning Bush, the Descent from the Mount, the Infant Samuel prophecying to Eli in the Tabernacle, the Building of the Temple, and the Angel appearing to Zachariah. In the head of the window is a *chorus angelorum*. The artists are Messrs. Morris & Co., of Queen-square, who executed the east window. The total cost of the church has been about £5,500, and the work has been carried out by Messrs. Bowdler & Darlington, of Shrewsbury, from the design of Mr. E. Haycock, architect.

Newbridge.—On Sunday, the 7th inst., the new church attached to the Convent of the Dominican Fathers at Newbridge, County Dublin, was solemnly blessed. The church, begun about three years since, has been erected from the designs of Mr. J. J. M'Carthy. The style is Early Gothic. It comprises a nave 90ft. by 30ft., terminated by a large semicircular apse, and lighted with lancet windows. Separated from the nave by pillars of polished Cork marble there is a chapel dedicated to Our Lady of the Rosary. Two stained glass windows (one representing the Ascension of our Lord) have been executed by Messrs. Earley & Powells, of the Camden-street Works.

New Cross.—On Friday last the new church dedicated to S. Peter, situated in the Wickham-road, New-cross, was consecrated by the Bishop of Rochester. The edifice is of the Early English Decorated style, and consists of a nave with aisles and transepts, terminating with a deep octagonal apse, with chancel chapels. The roof is supported by arches, and has a span of 43ft. clear. These arches rest on marble columns with carved capitals and Bath stone abutments, sustained by flying buttresses. There is a gallery at the west end occupying the lower portion of the tower, which is not carried up to the height it is intended to build it. The whole edifice will accommodate between 800 and 900 worshippers, and, when completed with north and south galleries it will seat 200 more. It has been erected by Messrs. Dove, of Islington, in accordance with the plans of Mr. Frederick Marrable, the architect, and when complete will cost about £10,000.

Ryhope.—The Bishop of Durham consecrated a new church at Ryhope on Wednesday week, the old village church having been found inadequate for the wants of the population. The new church has been erected in the cemetery, from designs by and under the superintendence of Mr. T. C. Ebdy, M.R.I.B.A., of Durham. The whole of the walls are of magnesian limestone from the beach, with freestone dressings. The columns and arches are in alternate bands of red and white freestone. The roofs are open timbered throughout, stained and varnished. The general arrangement consists of nave and chancel, south aisle, transept, vestry, organ chamber, and heating vault; a large tower on the south side of the north aisle and transept being omitted for the present. The church will accommodate 534 adults. The large window in the transept and the wheel window at the east end are filled with stained glass.

West Kirkby.—The church of S. Bridget, West Kirkby, was re-opened, after restoration at a cost of £3,000, on Thursday week. The church, which is in the Decorated style, consists of nave, chancel, north and south aisles, and a north chapel. The nave has an open-timbered roof, the trusses being supported on carved corbels. The chancel, which is arched and panelled, is divided from the north chapel by an arcading of three arches, the altar and the chancel arch being designed from the old moulded stones found during the excavations. The altar and the chancel are beautifully laid in Maw & Co.'s encaustic and glazed tiles. The church, which will seat 350 persons, has been rebuilt with stone from the Heswall hills.

BUILDINGS.

Burton (Dorset).—On Tuesday week the new school buildings which have been erected for the Dorset County School Company (Limited), at Burton, near Dorchester, were opened by the Ven. Archdeacon Sanctuary. The school buildings stand upon the summit of a hill, and are in the Venetian style. The principal façade faces the south-east, and consists of a centre pavilion of three stories, side wings, and end pavilions of two stories. The head-master's residence, the school department, and the domestic offices are entirely separated, although freely accessible each from the others. The principal or school entrance is in the centre pavilion, marked by a bold projecting hood carried on stone corbels. The dining hall is 70ft. by 28ft., lit with windows on each side. There are separate dormitories for the senior and junior boys, and baths, pantries, and other domestic offices are plentifully provided. The heating generally will be accomplished by ordinary open fireplaces, but the dining hall and drying room of the laundry will be warmed by the Rev. H. Moule's patent principle; earth closets and urinals are also provided on the same patentee's principle. Great care has been taken to secure abundance of light and ventilation throughout the buildings. The façades are faced with white Poole bricks, relieved with red in bands and arches, with Bath stone dressings. The roofs are slated. The hot-water apparatus, stoves, &c., were fitted up by Mr. John Galpin, of Dorchester. Accommodation is provided for 150 boys. The dining hall will for the present be used as a chapel, but it is intended at some future day to erect a detached chapel. The buildings have been carried out by Mr. G. J. Gregory, builder, of Dorchester, from plans by and under the superintendence of Mr. G. R. Crickmay, architect, Weymouth, Mr. Gerard being clerk of the works, and Mr. Chapman foreman. The cost has been upwards of £4,200.

Barnard Castle.—A magnificent mansion, museum, and picture gallery is being built for Mr. Bowes at Barnard Castle, at a cost of about £65,000. It is designed in the French Renaissance style of architecture, portions and details of which are taken from the Tuileries, in Paris; the Hotel-de-Ville, Havre; and other public buildings in France. The front and side elevations are of polished freestone, of a superior quality, from Dunn House quarries; they are four stories in height, with high mansard roofs, containing attics; the capitals of the columns, spandrels, trusses, brackets, and the panelling of the pilasters all elaborately carved. The cellars, which are in twelve compartments, are 210ft. in length by 45ft. in width, built entirely of dressed stone. The length of the south front is about 300ft.; the lengths of the side elevations about 135ft. each; the height of the centre pavilion is 115ft.; the height of the two end pavilions, 90ft., with a projection of 45ft. The basement story contains eighteen rooms, in addition to the cellars. On the ground floor, in the centre pavilion, is the entrance hall, with the grand staircase, which is 50ft. by 40ft., the interior walls of which are to be polished ashlar work, with carved mouldings and ornaments, and pilasters with marble panels. The steps will be of polished stone, 10ft. in width. On each side of the entrance hall, on the ground and first floors, are eight rooms, making sixteen rooms of large dimensions, most of which are from 30ft. to 40ft. in length, with wide corridors. These stories are 17ft. and 18ft. in height; the upper storey will contain about eighteen rooms of smaller dimensions; and above there will be eighteen or twenty attic bedrooms of good size and height. The centre pavilion will be carried up an additional storey, containing large rooms, from which a fine view of the beautiful surrounding country will be obtained. There are two picture galleries, each 200ft. long by 45ft. wide; the upper gallery being lighted from the roof, on the principle of the Pinacotheca at Munich, and made entirely fire-proof. It has been planned and designed by Mr. J. E. Watson, architect, of Newcastle-on-Tyne and Barnard Castle. The work is being executed by Mr. Joseph Kyle, contractor, of Newcastle-upon-Tyne, who is entrusted with the carrying out of the whole of the works. The boundary and other walls are being built by Mr. John Patterson, builder, Barnard Castle.

Chancery-lane.—Extensive additions have recently been completed to the building of the Incorporated Law Society, Chancery-lane. A handsome and commodious hall has been added, in which to carry on the numerous examinations which the society holds every year. Forty strong rooms have been added in the basement, and new coffee, drawing, and smoking-rooms added on the ground floor. Access to these rooms can be obtained from the entrance in Bell-yard (which has been considerably enlarged and otherwise improved), as well as from the old hall. Nearly the whole of the first floor of the new building is occupied by the new hall, which is capable of accommodating 200 students, and is approached by staircases from Carey-street and Bell-yard. The second floor of the new building comprises apartments for the resident clerk, and rooms for the deposit of the Society's papers. The whole of the additions and alterations have been carried out in accordance with plans prepared by Mr. P. C. Hardwick.

Church Gresley.—A new manufactory has just been commenced at Church Gresley, near Burton-on-Trent, for Mr. T. G. Green, in which it is proposed to carry out upon a large scale a novel process of casting earthenware, for which Mr. Green has secured several patents. The present works will be arranged in a series of parallel shops, each double range with six ovens being complete in itself, but admitting of indefinite extension in groups of six ovens; as the railway sidings, packing-shops and gloss-warehouses are at right angles to the main buildings. The architect is Mr. Gilbert R. Redgrave, of Kensington, London; and the builders Messrs. J. and H. Slater.

Dolgelley Market Hall and Public Rooms.—This building, which was opened on Thursday, the 11th inst., has been erected under the superintendence of Mr. W. H. Spaull, architect, of Oswestry, on a very commodious site in the centre of the town. It covers 4,960 super. feet, and contains a general market, 60ft. × 39ft., with four shops, kitchen, two bed-rooms, and four retiring rooms, an assembly room affording accommodations for 600 persons, with raised orchestra, and a spacious reading-room. The walls are of grey granite relieved by light Eyaith limestone dressings and arches. The contract was taken by Messrs. Humphrey, Jones, Rees, Owen, and Evan Morris, of Dolgelley. The total outlay for building, stalls, chairs, gas fittings, &c., was £2,200.

Newcastle-on-Tyne.—A new operating theatre and reception room, with a small pavilion ward of five or six beds, is about to be commenced at the east end of the Newcastle Infirmary. The infirmary (said Dr. Charlton, in his address last week as President of the British Medical Association) is an ancient building with modern additions, which themselves may now be looked upon as somewhat antiquated. Constructed originally more than a hundred years ago, a considerable addition was made to the building at the beginning of the present century. These additions were certainly not greatly to the credit of the architect, for the corridor was, as in a very recently-erected hospital in the south, carried along the south side of the building, while the wards were made to look out towards the gloomy north. Again, in 1852, three large double wards, containing 150 beds, were added at the west end, but this, though a vast improvement on the older parts of the building was open to the objection that it was not constructed on the pavilion system.

Proposed New Poultry Market.—The Markets' Improvement Committee of the Corporation have had under their consideration for upwards of a year the question of the best mode of utilizing the vacant land on the west side of the Metropolitan Meat Market and on the northern and southern sides of the western approach street to the Holborn Viaduct, and have come to the conclusion that the erection of a new poultry market for the city would be the most suitable appropriation of the sites in question. They base this recommendation on a previous report of their own, in which they urged that the vacant land ought to be made available, so as not only to be advantageous to the

Corporation in a pecuniary point of view, but also conducive to the interests of the inhabitants of the metropolis, and also on a statement drawn up by the City Architect at their request. In this document is laid before the committee, in general terms, the cost and returns of utilizing, for the purposes of a poultry market, that portion of land westward of the Meat Market, and on the south side of Charterhouse-street, now in their possession. He states that it might be assumed, in round numbers, that there are about 55,000ft. superficial of land in that block, with a frontage opposite the Meat Market of 200ft., and in Charterhouse-street of 270ft Of that, 17,000ft. might be expected to be devoted to gangways and passages, leaving, on the ground floor, 38,000ft. for shops, which, at the rate of 4s. 4d. per foot per annum, would produce £8,233. To this might be added £3,150, being the amount at which the basement might be let, and £2,167 for the occupation of the upper floor. The returns in all would amount to £13,550. Against this would have to be placed £5,000 for the annual value of the land, and £6,000 for the interest on the cost of building (£100,000), leaving £2,500 for expenses and outgoings, to which would be added the sum received for tolls. The architect adds that about £4,000 or £5,000, the probable moiety of the cost of forming the road on the west side of the proposed market, might be deducted from the value of the land. The committee, after a careful and lengthened deliberation, have approved of the architect's report, and recommended that they should be authorized to give directions for the preparation of a design, plan, and estimates for the proposed market.

Rotherham.—The Midland Railway Company has decided to erect a new station at Rotherham, in the place of the present one, which is found to be too small for the increasing traffic. The new station will be a light wooden structure, about 144ft. long, running parallel with Main-street, which connects Rotherham and Masbro'. The platform, which will be 460ft. long by 20ft. broad, will extend right over the river Don and will be covered in to the extent of the main building by a glass roof supported by light iron pillars. On the same level with the platform will be the booking offices, station-master's room, &c. The contract has been let to Mr. Chadwick, of Masbro', and the work is to be completed in four months' time.

Stornoway, N.B.—The large additions to the County Buildings at Stornoway, which are now finished, at a cost of upwards of £2,000, form a prominent feature in the appearance of the town as well as an extensive improvement in the court-house accommodation. The plans were prepared by Mr. Maitland, Tain, the county architect.

West London District Schools.—On Saturday, at Ashford, Middlesex, the foundation-stone of industrial schools for the poor children of the S. George's Union was laid. Mr. H. H. Collins, M.R.I.B.A., of 5, Queen-street, Cheapside, is the architect, whilst the building contract has been entrusted to Messrs. Joseph Bull & Son, of Southampton, at £43,000, although it is believed that with extras and fittings the gross cost will be about £60,000. The buildings are of the composite Italian style, of red brick and Bath stone facings, and the frontages of the buildings are placed parallel with the railway, so as not to encroach too much on the land, which will be used for farming purposes and probably for building, Ashford becoming an improving village. Connected with the main building is an exceedingly neat chapel, and also sufficiently detached from it are the quarantine wards, the infirmary, and fever and small pox hospital. The buildings will accommodate, in the main structure 700, infirmary 72, fever and smallpox 24, and reception wards 22; total, 818 children, exclusive of the accommodation provided for officers and servants.

◆

Steam Road-Rolling Company.—A prospectus has been issued of the Steam Road-rolling Company (Limited), with a capital of £5,000 in shares of £1, for the introduction into general use of heavy steam road-rollers for consolidating macadamized and other roads. It is proposed to let such rollers to parishes where they may be desired, or to contract for the performance of work. It may be hoped that the management of this undertaking will be such as to leave parochial authorities without any pretext for the continuance of a system of roadmaking that has long been a scandal to the metropolis.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

To Our Readers.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office not later than 5 p.m on Thursday.

◆

Received.—R. D., J. H., H. H., G. H., B. & Co., H. W., F. & J., W. D. D., H. & Sons, J. P., J. P. J., G. A., W. B., E. H., L. E. H., J. H., J. D., J. T., Col. S., Rev. J. A. M., W. & Co., B. & S., W. D., H. K.

Correspondence.

ARCHITECTS' PUPILS.

(*To the Editor of the* Building News.)

Sir,—Seeing no further notice has been taken of an article in your journal of July 24th, I beg to submit the following remarks upon the subject, which I trust will receive the same publicity as those earnestly made by "An Injured Pupil."

Certainly pupils do not like to make complaints to their tutors during the time of learning, neither would they wish to do so were they not compelled, but they feel it severely when their time is terminated and cannot find employment in consequence of so many pupils being admitted into the profession, and that too, in many cases, without an assistant or clerk of works being employed. The following may be given as one example from many others:—

An architect in one of our largest flourishing towns has at present the whole of his work carried on by four pupils and a clerk of works. As soon as the pupils have completed their time to the profession, they have (unless very lucky in getting some *poor* situation), to turn their hands to something else—perhaps go to college and spend a *little* more money in consequence of not having half been taught their profession. Besides, I am quite certain that *no* architect can attend properly to the advantage of their future welfare if he has more than two pupils at a time. But clerks of works (composed chiefly of ex-builders who have been at no expense in learning the profession), receive employment simply because they profess to know the practical part, and to take out quantities, which really the *pupil ought to be taught.* I ask the question—Is this fair to pupils? I say no. Can there not be something done to put a stop to the present sad state of affairs? I should like to see the subject taken up by your readers. Why should an architect have the advantage over a solicitor or stonemason? Why should a solicitor be compelled to take no more than two pupils, and a stonemason no more than one apprentice to every four men, and not allowed at one time to have more than three apprentices? Yet our most valuable profession is made a trap to catch any careless bird that likes to step in. I am, Sir, &c., Justice.

ANCIENT CROSS.

Sir,—The correspondent who submits the very interesting drawing of an ancient cross from Llantwit is silent as to the inscription. I take the letters to be very early English, with strong affinity to the Irish modifications of the Greek alphabet. So far as I can venture to guess, the language is Norman-French. I read the first line as—" "Oi nomme li Pater;" in the last line I find—"Pro anima reo;" which indicates that this was a royal memorial cross.

I should not like to guess further until I learn if the inscription is perfect; four lines seem intact, but may all be defective at either end; there are also certain fragments which seem to indicate that there have been six lines.

Perhaps this may be cleared up.—I am, Sir, &c.
August 12, 1870. A. Hall.

WHICH IS THE GROUND STORY OF A HOUSE?

Sir,—On Friday last I summoned a builder to the police court at Hammersmith for corbelling out a chimney at too low a level. Now his contention was that the ceiling level with the pavement was the ground floor; mine the opposite. The building in question is an ordinary house of four stories or floors: one floor several feet below the pavement level, one a few inches above the pavement, and over this there are two other floors; there is also a building or addition two floors high, commencing at the lowest level of the front building constructed at the back. The magistrate has adjourned the summons till Friday, the 26th of August, that evidence may be given by the profession as to which is really the ground floor or story.

My object in writing this is to ask as many of your readers as will take the matter up to be kind enough to write me personally on the subject that his Worship may have the opinion of the professional and building public.—I am, &c.,

T. E. Knightley, District Surveyor.
The Grove, Hammersmith.

THE TRANSMISSION OF TRACINGS ON LINEN PER BOOK POST.

Sir,—Having been in correspondence with our Post-office regarding the transmission of tracings on linen per book post, I now have the pleasure to hand you a copy of an official communication just received by me, which, besides being serviceable to those of your readers who have business connections in Belgium, will doubtless prove interesting also to the general public, as showing how ready the authorities are to act upon any suggestion which may conduce to its greater convenience.—I am, Sir, &c., W. Lloyd Wise.

Chandos Chambers, Buckingham-street,
Adelphi, London, W.C. August 15th.

General Post-office, London, August 13th, 1870.

Sir,—Since the receipt of your letter of the 9th of June last, I have been in communication with the Belgian Post-office, with the view of obtaining the consent of that office to the transmission of tracings on linen between the United Kingdom and Belgium, under the regulations of the book post, in the same manner as tracings on paper. Arrangements have now been completed, under which tracings on linen of an architectural or mechanical nature will be allowed to pass to Belgium at the book rate of postage.—I am, Sir, your obedient servant,

W. Lloyd Wise, Esq, Wm. Jas. Page.

HALIFAX BUILDING SOCIETY'S COMPETITION.

Sir,—The particulars of this competition were advertised in your journal last year; the building to cost only £5,000. The drawings have been sent in nearly seven months. No notice has yet been sent to the competitors that anything has been done. A poet has written something about "learning to labour and to wait,"—alas, the common lot of architects!—but surely it is time the Halifax Building Society's Directors were "up and doing." In any case the competitors will do well to have their hearts "prepared for any fate."—I am Sir, &c., A Victim.

CAMBERWELL CHARITY ESTATE COMPETITION.

Sir,—As I have seen no mention made in your paper as to the settlement of the competition for laying out the Camberwell Charity Estate in the Old Kent-road, for which thirty-six designs were sent in, and which were referred to Mr. Pownall, I beg to forward you a copy of the report in the *South London Chronicle* of the 30th ult.:—

"Mr. Pownall sent in his report upon 'Bowles' Five Acres,' in the Old Kent-road, and he, having examined all the plans and considered all the papers, decided that 'Spes' was entitled to the first premium of twenty guineas, and 'Vigilans No. 1' of ten guineas. The letters of the competitors were sent for, and opened, when it was found that the first successful competitor was Mr. Alfred Wright, architect, No. 68, Knowle-road, Brixton; and the second, Mr. A. G. Hennell, of Southampton-buildings."—I am, Sir, &c. Alfred Wright

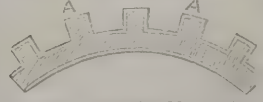
August 17, 1870.

Intercommunication.

QUESTIONS.

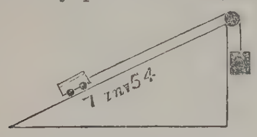
[1912.] FACTORY CHIMNEYS.—Would some of the readers of "Intercommunication" oblige me with their practical experience on the following points:—Is it good to put hoop iron longitudinal band in the courses of brickwork all round the chimney at different heights? What are found to be the best means of cramping and dovetailing the overhanging stone or fireclay cornices, and the blocking at the top of the chimney? Should the upper portion or any part of the chimney be built in cement?—Student.

[1913.] RETAINING WALL.—The accompanying sketch shows the way I am about to build a circular retaining wall, and I should be glad to know at what distance the buttresses A A should be built apart, and also if they should be of the same thickness as the wall itself. Is it best to build them as I have shown, with the sides sloped in the direction of the centre of the



curve of the face of the wall, or should they be built square both on the back and sides? If one of your correspondents would answer these questions for me I should feel obliged to him, as I want to get on with the job.—Contractor.

[1914.] SELF-WORKING GRADIENT.—I wish to apply the principle of a self-working gradient to some mines—that is, I require to make my road at such a gradient that the full waggon going down will pull the empty ones up. The only information I have been able to get from books is shown in the diagram, where the weight necessary to pull a lorry up an incline of a given ratio can be



calculated. But I cannot make this work out in my way to be of any use to me. Perhaps you can help me in your "Intercommunication." The weight of the empty waggons are ¾ cwt. each, and 3½ tons when full.—Miner.

[1915.] EVAPORATION.—What is the usual amount allowed for loss by evaporation from the surfaces of lakes and canals, or any large surfaces of water which are exposed to the wind and sun?—L. P. C.

[1916.] FLOORS.—As I am only a beginner, will you allow me to ask the meaning of "single" and "double" floors? I was reading a specification lately, and the floors were specified to be double. If any of your readers would kindly give me this information, and a small sketch of the two kinds, I should be thankful to him.—Apprentice.

[1917.] PLASTERING.—Can any one inform me from actual observation how much surface in two-coat work and three-coat work on brick can be covered with a given quantity of coarse stuff and fine stuff? Say coarse stuff composed of 1 cubic yard of chalk lime, 2 yards of sand, and 3 bushels of hair; and fine stuff, 1 cubic yard of lime, with 2 bushels of hair. From the various building works I glean that 1 yard of lime, 2 of sand, and 3 bushels of hair should cover 75 yards in two-coat, and 65 yards in three-coat work; but I cannot glean from this the proportion to each coat, or believe these figures to be very accurate. Also how much fine stuff can be obtained from one cubic yard of chalk lime, and is it usual in the London trade to add to the putty sand and hair, and in what proportions?—Hawkboy.

REPLIES.

[1906.] WEIGHT OF RAILS.—Your correspondent is not quite correct in saying that while the weight of rails is increased the traffic is pretty much the same. This may be true of the carriages but not of the engines, which, like the rails, are becoming heavier and heavier every day. The weight of the engine determines that of the rails, as can be easily shown; for let W be the total weight of the engine when in working order, and N the number of wheels, then $\frac{W}{N}$ will be the greatest load on any one wheel, and consequently the greatest load the rail will have to bear. Experience shows that if we multiply this by 2·75 we obtain the weight of the rail in pounds per foot run; therefore the weight of rail per foot in pounds $= \frac{2{\cdot}75 \times W}{N}$.—Steam.

[1907.] SHRINKAGE IN CASTINGS.—Let "J.M.D." go into the pattern-making shop and ask the foreman to let him look at his rule. He will find that it is ⅛in. longer than ordinary ones, and thus it is that the shrinkage is allowed for.—P. S. R.

[1907.] SHRINKAGE OF CASTINGS.—Pattern-makers should allow for cast-iron 1-8in. longer per lineal foot for shrinkage; brass, 3-16in. ditto; tin, 1-12in. ditto; lead, 1-8in. ditto; zinc, 3-16in. ditto.—J. B.

LEGAL INTELLIGENCE.

Slander.—Morley *v.* Nelson.—This was an action tried at Guildford on Saturday to recover damages for slander. In this case the record was withdrawn. Mr. Serjeant Ballantine stated that the plaintiff was an attorney, who was well-known in his profession, and the defendant, Mr. Marsh Nelson, was an architect and surveyor, who was also well known. The plaintiff had been retained by the defendant to act professionally on his behalf, and it appeared that in the course of the proceedings he made certain statements reflecting upon the honour and integrity of the plaintiff; but the defendant, in the most unequivocal and unqualified manner, now withdrew all the imputations that he had cast upon the plaintiff, and the record would therefore be withdrawn, the defendant paying the costs. Mr. Hawkins said that the defendant, upon consideration, felt that he had no ground for making the imputations upon the character of the plaintiff, and he therefore withdrew those imputations, and admitted that his conduct was unjustifiable. The learned judge observed that the expressions made use of by the defendant might have been understood to cast very serious imputations upon the character of the plaintiff, but these imputations had been withdrawn, and he considered the course that had been adopted to be very satisfactory. A nominal verdict was then recorded in favour of the plaintiff.

Original and Collateral Liability.—In the case of Mountstephen *v.* Lakeman (says a legal correspondent), the chairman of a local board, having verbally ordered a contractor to perform certain works, and the works having been completed in pursuance of such order, and the board having subsequently repudiated the authority of their chairman to give such an order, the contractor brought the present action in the Court of Queen's Bench. It was held that such an order did not create an original liability on the part of the defendant, but that it only amounted to a promise to answer for the debt of another within the meaning of the 4th section of the Statute of Frauds, and, as such, required to be evidenced by writing under the hand the party sought to be charged.

St. Mary's Chancel Gates, Taunton.—The application for a faculty to re-erect the gates in the chancel of S. Mary's Church, Taunton, again came before the Consistorial Episcopal Court at Wells on Tuesday week. Mr. Welsh, the proctor for the opponents, applied for further time in order to produce all the affidavits, which application was eventually granted, and the case was adjourned till the first Tuesday in October.

Disputed Contract.—Crump *v* Tooley.—This was an action for £10 12s. 7d. for work done under a contract, as alleged by plaintiff, and was tried at the Ramsgate County Court on Tuesday week. The plaintiff is a carpenter and joiner, and the defendant, till lately, was a builder, and had a sub-contract with a Mr. Wilson in reference to making the staircases for some houses. Eventually he relinquished his business and arranged with Crump to finish the work upon the agreement that he was to receive the amount due under the contract for the completion of the staircases, &c. It was admitted on both sides that the whole of the contract money had been paid to the defendant by Mr. Wilson, but the contention on the part of the defence was that Crump had only been employed as an ordinary workman, for which he had been paid his weekly wages. Witnesses were examined on both sides, and His Honour, believing the plaintiff's story to be correct, gave judgment for the amount claimed.

◆

LAND AND BUILDING SOCIETIES.

Irish Civil Service Building Society.—The annual general meeting of this society was held on Saturday. The secretary submitted the directors' report for the year ended 31st May last, from which it appeared that the receipts amounted to £57,547 12s. 7d., making a total of £187,278 4s. 10d. since the society was established six years ago. It further stated that the advances to members for building purposes and for the purchase of leasehold and freehold property, which in the five years ended May, 1869, amounted to £95,728 4s., had been increased to £127,633 14s. 8d., and the amount of assets, which for the period referred to amounted to £81,509 6s. 2d., had increased to £98,615 5s. 5d. After paying the usual interest of 5 per cent. on fully paid up shares at the same ratio, there remained an additional profit amounting to £2,382 4s. 8d., out of which the directors had declared a bonus at the rate of 2½ per cent., thus giving a return to the shareholders of 7½ per cent. per annum, free of income tax, and leaving a balance of £483 13s. 7d., out of which the directors recommended that £450 should be invested in fully paid up shares of the society, in the names of the trustees, in a reserve fund.

◆

WATER SUPPLY AND SANITARY MATTERS.

Ashford (Kent).—At a large meeting last week of the inhabitants of Ashford, convened by the Ashford Local Board, it was resolved to call in the assistance of Mr. Baldwin Latham, C.E., of Croydon, to inquire into the drainage of the town, and prepare a report.

Barnard Castle.—At the last meeting of the Barnard Castle Local Board of Health, a letter was read from the Home Office, stating, in reply to a memorial of the inhabitants, that the Home Secretary has directed an inquiry to be made into the water supply of the town, under the 49th section of the Sanitary Act, 1866.

Berwick.—The water supply at Berwick is at present very limited, and from want of flushing the sewers are in a very bad state, emitting very foul gases. The water is turned on (for domestic purposes) for a very short time each day, and a supply has to be carted from Tweedmouth for the use of the inhabitants. It has been agreed to invite Mr. Leslie, engineer, Edinburgh, to visit the neighbourhood, and report on the best scheme of water supply, and the cost of carrying it out.

Chesterfield.—At the meeting of the Chesterfield Town Council on Wednesday week, Dr. Black directed attention to the state of the water of the Rother, and produced numerous specimens showing considerable impurities, and also that the water was better where filter-beds were used. In one sample he said there was a considerable dark sediment, which consisted of excrementitious matter and other particles, amongst which he found two segments of tapeworm in very active operation. (!) If they carried the idea further (said Dr. Black) how many thousands, nay, millions of tapeworms must there be in the river? and supposing that water to be carried into the human system need they wonder at the prevalence of tapeworm? The one piece of practical advice he impressed upon the inhabitants was that during the present dry weather they should cease to use their water closets.

Eton.—The works for the main drainage of the town and college are being vigorously prosecuted during the college vacation. Tenders have been accepted and the work commenced The negotiations for the necessary loans have also been completed. The scheme adopted is known as the "separate system."

Handley.—Mr. Richard Coke, surveyor, of Chesterfield, is now engaged in making plans for water supply to Handley, Staveley, Woodthorpe, and Marsden Moor, and proposes impounding the water from the Barlow and Holmesfield district. This elevation would also enable Dronfield to be supplied at a reasonable cost, and an offer to that effect has been made by Mr. Coke to the inhabitants of Dronfield, who have not yet, however, accepted it.

Hurworth-on-Tees.—The report of Mr. Arnold Taylor respecting the main drainage of the village of Hurworth-on-Tees was received at a meeting of the vestry last week. Mr. Taylor reported that great danger to the health of the inhabitants arose from the continuous soaking and poisoning of the subsoil, in consequence of the drains in three or four instances ending in the gravel, and in others being open-jointed and made of porous field-tiles and drain-pipes. The effect of this was seen in the drinking water, seven samples of which were sent to Dr. Frankland for analysis. The majority of these contained a good deal of unoxidized organic matter of animal origin, and their use for domestic purposes would be attended with great risk to health. London sewage filtered through 5ft. of gravel was a better water than four of the samples. Under these circumstances, the Secretary of State desires the vestry to show cause within fourteen days why an order should not be made allowing two calendar months for the sewer authority to perform its duty by setting about the necessary works of sewerage, drainage, and water supply, as well as for the outfall and disposal of its sewage. The meeting resolved, "That the vestry take the necessary steps to perform its duty under the Sanitary and Sewage Utilization Acts, and that a special meeting of the vestry be summoned for the purpose of forming a committee under Section 4 of the Sanitary Act of 1866, also for the appointing of a vestry clerk, and other business."

The A B C Process of Utilising Sewage.—At a recent meeting of the General Purposes Committee of the Brighton Town Council, a letter was read from the general manager of the Native Guano Company (Limited), requesting the Town Council to support the company's application to the Home Secretary that a royal commission be appointed to examine into the merits of their A B C process of utilising sewage. The committee resolved, "That the town clerk do write to the Home Secretary, stating that as conflicting reports and opinions have been expressed concerning the value of the process of utilising sewage known as the A B C process, the Corporation of Brighton respectfully request the Home Secretary to grant the prayer of a memorial, which they are informed the Native Guano Company (Limited) have presented, for a Royal Commission to inquire and report as to its merits."

◆

STATUES, MEMORIALS, ETC.

Nice.—The monument to the late Mr. J. W. Prowse, the journalist, has been completed, and will shortly be placed over his tomb.

Stonewall Jackson.—Shortly after the death of the great Virginian general the foolish English admirers of that hero formed a committee, of which Mr. Beresford Hope, M.P., was treasurer, and Mr. W. H. Gregory, M.P., secretary. Their object was to erect a bronze statue of General Jackson in some public place within the state of Virginia. Subscriptions flowed in freely, and the work was entrusted to Mr. Foley, R.A. The ill-health of the artist delayed the work for some time, but we are now informed that the effigy will shortly be ready for casting.

◆

Our Office Table.

Lead Poisoning.—In an article on white lead, which appeared in the Building News on the 11th of March last, the writer deprecated the use, by painters and others, of gin or other spirituous liquor as a fancied antidote to lead poisoning. This view is confirmed, we see, by Dr. Charlton, who referred to the matter in his inaugural address last week as President of the British Medical Association. Dr. Charlton said:—"We have large lead-works on the Tyne, both of white lead and red lead, and our hospital is rarely without several cases of lead disease from the white lead factories. We often have this malady in its most aggravated forms, and it is observed that the women suffer much more than the men, as it is the former who are chiefly employed in handling and stacking the carbonate of lead. It has been maintained that the greater intemperance of the male workmen acts as a prophylactic against the lead poison; but we are inclined to refer their greater immunity rather to the nature of their work."

New Park in Manchester.—The new public park at Moss Side, named the Alexandra, in honour of the Princess of Wales, was formally opened to the public on Saturday. The new park covers 60 acres, and has cost £60,000. The other public parks in Manchester and Salford were presented to the inhabitants by a committee, which raised the necessary subscriptions in one year, and completed their gift in another. The new park is the first in Manchester of which the expense is defrayed out of the municipal funds.

Paving Streets by Steam.—A steam paving machine has recently been introduced in Paris, and made use of by the municipality for the repair of the streets of that city. This machine consists of a small steam-engine on wheels, drawn by one horse, to the rear of which is attached the "pavior," which is forced upon the ground by a blow from the piston, and slides on a bar some six feet long, and can thus be directed by the driver to any stone which requires forcing home. The machine was lately at work in the Rue de Grenelle, and is considered a success.

Meeting of the British Association.—The fortieth annual meeting of the British Association for the Advancement of Science will be held in Liverpool, commencing on Wednesday, September 14. The president elect is Professor Huxley, LL.D., F.R.S., &c.; the vice-presidents elect are the Right Hon. the Earl of Derby; the Right Hon. W. E. Gladstone, M.P., D.C.L., &c.; Sir Philip G. Egerton, Bart., M.P., F.R.S., &c.; Sir Joseph Whitworth, Bart., LL.D., F.R.S.; Mr. S. R. Graves, M.P.; Mr. J. P. Joule, LL.D., F.R.S., &c.; and Mr. Joseph Mayer, F.S.A. The Mayor of Liverpool (Mr. Joseph Hubback) is the chairman of the local executive committee, and Mr. H. Duckworth, F.G.S., officiates as local treasurer. The sections are :—A. Mathematics and Physics ; B. Chemical Science ; C. Geology ; D. Biology ; E. Geography and Ethnology ; F. Economic Science and Statistics ; G. Mechanical Science. These will meet each day, from eleven to three o'clock, in S. George's Hall, the Town-Hall, Free Public Library, and other places to be duly announced. The following is the programme of general and evening meetings :—Wednesday, Sept. 14—The first general meeting will be held in the Philharmonic Hall, at 8 P.M., when Professor Stokes, M.A., D.C.L., will resign the chair, and Professor Huxley, LL.D., F.R.S., will assume the presidency and deliver an address. Thursday —The Mayor's first reception at the Town-Hall. Friday—Lecture in the Philharmonic Hall, at 8½ P.M., by Professor Tyndall, LL.D., Ph. D. The Mayor's second reception at the Town-Hall. Saturday—Address to the working men in the Concert Hall, Lord Nelson-street, at 8 P.M., by Sir John Lubbock, Bart., M.P., F.R.S. Monday—Lecture in the Philharmonic Hall, at 8½ P.M., by Professor Rankine, LL.D., F.R.S. Tuesday—Soiree in S. George's Hall, at 8 P.M. Wednesday—Concert in S. George's Hall, at 8 P.M. Thursday —Excursions to several places. Messrs. W. Banister, B.A. ; R. Harrison, F.R.C.S. ; H. H. Higgins, M.A. ; and A. Hume, D.C.L., LL.D., act as honorary local secretaries.

TEMPLE BAR DOOMED.—Some fine morning soon (says the *Observer*) the Londoner will wake up bewildered and amazed to an entirely new world. Temple Bar is to be removed, and London will be London no more, but a large and somewhat similar city that happens to be built on the same site. The decree is about to go forth, and many months will not elapse before the grimy, worm-eaten door, and the heavy arch, with its statues of successfully-disguised personages and battered carvings, will disappear. It is part of Mr. Street's plan that Temple Bar should be removed, that Fleet-street should be widened at that point, and that a new archway of greater span should be erected, so as to communicate with the Temple and the New Law Courts. With the old archway will vanish the last of many historical associations.

STREET IMPROVEMENTS IN SOUTH LONDON.—In the parishes of Newington and Lambeth a great improvement is now in course of execution. A very large piece of ground, bounded by Newington Butts, Lower Kennington-lane, Renfrew-road, Kennington-road, Brook-street, and Prospect-place, is about to be laid out for building purposes; and several new streets, which will greatly conduce to the convenience of the inhabitants, are in course of formation. The lower part of this large open space, known as the East Park Estste (formerly the property of the late Sir Gilbert East) was built upon some seven or eight years since, the roads known as Hurley-road, Kempsford-road, Gilbert-road, and Renfrew-road, being formed at that time. The only approach to all these roads is by Hurley-road, which at one end leads into Kennington-lane, but the other end, and the ends of several other roads, although coming up to the back of the Kennington-road, have no approach therefrom, and the inhabitants on the estate wishing to go to Kennington-road or Westminster-road have consequently hitherto had to make a long circuit; but some of the roads above-named are about to be opened out to Kennington-road, while through that part of the enclosed space not yet built upon —extending from the back of Mr. Spurgeon's Tabernacle and Newington Church to Kennington-lane on the one side, and to Brook-street, Kennington-road, on—the other several new streets are to be made. Two are now in course of formation, viz , one leading from the east end of Brook-street to Newington Butts, a few doors below the church, and one leading from Renfrew-road (by the side of the new Lambeth Police-court) to the road just spoken of as being in course of construction.

NORTH OF ENGLAND INSTITUTE OF MECHANICAL AND MINING ENGINEERS.—The annual general meeting of the members of this Institute was held on the 6th inst., in the lecture-room of the Literary and Philosophical Society, Newcastle. Mr. E. F. Boyd, President, occupied the chair Three new members and one graduate were elected, and ten gentlemen were nominated for election as members at the next monthly meeting. The reports of the Council, Finance, Technical Education, and Safety-Cage Committees were read to the meeting. The Council, in their report for the year, whilst congratulating the members on the continued prosperity of the Institute, expressed their regret at the loss they had sustained by the deaths of Mr. John Hedley, Mr. T. Y. Hall, and Mr. J. J. Atkinson. The reports were adopted, and the officers and council for the ensuing year were elected, Mr. E. F. Boyd being re-elected President. Mr. Boyd briefly thanked the members for the honour thus done him, and the proceedings terminated.

RECOGNITION OF A SURVEYOR'S SERVICES.—At a meeting of the Hastings Town Council on Friday week, Mr. Alderman Ross drew attention to the services of Mr. Andrews, the town surveyor, in reference to the successful termination of the town drainage scheme devised by him. He (Alderman Ross) considered that Hastings was the best-drained town in the kingdom, and much of the credit was due to Mr. Andrews, who acted not only as surveyor, but also as engineer ; and under these circumstances the Council ought to acknowledge his services in a most substantial manner. The neighbouring town of S. Leonards paid the engineer of their scheme £869, and at the same rate, according to the Hastings outlay, the Council would have to pay £2,607. The matter was referred to the Roads Committee for consideration.

THE ORGAN AT ETON COLLEGE CHAPEL.—The organ at Eton College chapel having undergone extensive alterations, it became necessary to enlarge the organ loft and add very much to the fine oak carved work enclosing it. The work was entrusted to Mr. T. Stopher, of S. Matthew's, Ipswich, and the first portion has been executed and fixed. This portion consists of three heavy moulded arcades, supported by oak clustered columns, to carry the organ loft on the west side or ante-chapel. The second part consists of overhanging tracery work on the last, or chapel side, and is divided into panels with deep moulded double cornice and panelled soffit. The upper part is surmounted with perforated screen-work, and forms the organ-player's floor. This part of the work is complete, but there yet remains to be executed the most elaborate part of the work, which consists of an entire west front, and which, when complete, will have a very imposing appearance. The organ will be one of the finest in the kingdom, and the beautifully carved loft, with its fine and richly decorated screen of perforated work, will be a worthy receptacle for it.

THE METROPOLITAN BOARD OF WORKS.—It is stated that Lord Robert Montagu, M.P., has, at the suggestion of friends in London, been induced to become a candidate for the chairmanship of the Metropolitan Board of Works, he having taken an important part, as Chairman of the House of Commons, in the question of the profitable utilization of the sewage of the metropolis and other large towns. There is also an ominous rumour that Mr. Ayrton intends to take possession of the post, and so, as Chief Commissioner, and Chairman of the Metropolitan Board, manage matters with a strong hand. Probably after the late rebuff to pluralism, as administered to the Attorney-General, this will not be attempted. Some radical change is, however, intended, as notice is stated to have been sent to the Board that any member accepting the office of Chairman will do so subject to the abolition of the office hereafter by Parliament.

INTERNATIONAL EXHIBITION OF 1871.—We are requested by her Majesty's Commissioners to state that there is no foundation for the rumour that the International Exhibition appointed for 1871 is to be postponed by reason of the war. The first of the series of Annual International Exhibitions of Selected Works of Fine and Industrial Art and Scientific Inventions will take place next year, as already announced.

PROPOSED TRAMWAY THROUGH SHOREDITCH TO HACKNEY.—At the last meeting of the Bethnal Green Vestry, the Works Committee reported that they had considered the proposed scheme submitted to the Vestry by Messrs. Day and Hassard for the construction of tramways leading from the City to Shoreditch, and thence to pass through Hackney-road, Bethnal-green-road, Old Ford, and Clapton, and recommended that, provided proper provision be made to protect the public interests, no opposition be offered to the scheme. The recommendation of the Committee was adopted, and it was incidentally stated that Miss Burdett Coutts, who was one of the promoters of the scheme, intended to widen Gibraltar-walk and carry the tramway lines on to Columbia Market.

STONES OF MANY FORTUNES.—The destruction of buildings, or rather the using up of old building materials, has been going on in Asia for some three thousand years, and perhaps more. A stone once squared has always a utilitarian designation, and the catastrophes of earthquakes and fires lead the people to have little regard for monumental stones, and to turn every available material to account. Thus there are stones which have figured in many various capacities. Worked up for a Persian palace, they have been stuck into the inclosure of a Greek temple ; from this transplanted on emergency to the fortifications ; chosen to build up a Christian church ; taken away to repair the walls against a Gothic, a Saracenic, or a Genoese invader ; figuring in a Genoese factory or fortress ; selected by the Seljuks or the Osmanlis for the pillar of an aqueduct. Tumbling down, they are put as a tomb over the grave of some traveller or pilgrim, used as a boundary-mark for land, or worked up in a peasant's chimney. The worst fate is to be burnt in a kiln for lime. This is the doom of marble, from which sandstone is exempt.

◆

Chips.

It has been resolved to rebuild the church of S. George, Easton-in-Gordano, at a cost of £2,000.

A new church at Halifax has just been consecrated. The church, which has cost £8,000, has been presented by Mr. Michael Stocks, of Upper Shildon Hall.

The Mayor of Bradford laid the foundation stone of the new town-hall on Wednesday week. The cost of the building will be £43,000, exclusive of site. Messrs. Lockwood and Mawson are the architects.

A beautiful Norman font, carved in Caen stone, has just been placed in the chapel of Holy Trinity, Bolton, near Alnwick.

It is proposed to erect a new bridge 30ft. wide at Peterborough, at a cost of £6,000. The counties of Huntingdonshire and Northampton have each promised to contribute £2,000, and £1,400 in addition has been subscribed, leaving a deficit of only £600.

A statue to Sir James Outram is to be placed on the Thames Embankment North.

The foundation stone of a new church was laid at Middleton-one-Row, near Newcastle, on Saturday.

It is proposed to erect an ornamental drinking fountain at Crawley, in memory of the late Mark Lemon.

The fabric of the parish church at Ash, Kent. has been examined by an architect, who has given it as his opinion that, in consequence of the effects of dry rot, it will be necessary to renew nearly all the timberwork of the building.

The foundation stone of a new Primitive Methodist chapel was laid at Wood Mill, Yoxall, on Tuesday last.

On Wednesday last the memorial stones of a new Wesleyan chapel at Burton on-Trent were laid.

The office of Surveyor to the Home Highway Board, Canterbury, is vacant.

A plot of land, containing 4,000 square yards, has been purchased in Seacombe, as the site of a new Roman Catholic church and presbytery.

◆

Timber Trade Review.

The present state of affairs on the Continent makes a list of prices actually paid of more than ordinary value. Freights have risen in consequence of so many vessels being idle, and foreign houses will not be slow to make the stoppage of the supply of Prussian timber and deals an excuse for increasing their prices. The sale on August 17 consisted of

150	Loads	Dantzig and Stettin fir
200	,,	Stettin oak do.
400	,,	Quebec and Halifax birch
150	,,	Quebec walnut
100	,,	Quebec red and yellow pine
250		Memel and Riga wainsco logs
250		Quebec do.
75,000		Quebec and Saguenay yellow pine deals, &c.
50,000		Quebec and Saguenay spruce
25,000		Lowerport spruce
20,000		Riga white
25,000		Skonwick and Gefle
20,000		Hudikswall and Sundswall
70,000		Dram, Christiana, and Vefsen
10,000		Other Swedish and Norway
90,000		prepared flooring boards
250	Fathoms	firewood
		Palings, laths, architraves, &c., &c.

For which the following prices were obtained :—

	£ s.		£ s.
Archangel 3rd yellow per Petg. std.	8 10		
Bathurst unsorted spruce .. 120 12 3 × 9	12 10	to	13 15

THE TIMBER TRADE OF GRIMSBY.—In consequence of German vessels being thrown out of competition in carrying cargoes of timber to England, freights have advanced immensely. For two years past freights had been ruling very low, but the outbreak of war had its immediate effect in producing a reaction, and charges for carriage of timber cargoes advanced rapidly. The supplies of timber from the Prussian ports of Memel, Dantzig, and Stettin being now cut off, has naturally caused an increased demand for Swedish and other goods, and this, combined with the rise in freights, has produced an advance of prices in the trade generally of about 10 per cent. The merchants, however, who have stocks on hand of log timber from the three Prussian ports named put an additional value of 40 per cent. on these goods from the prices current before the declaration of war. The success of the German forces has not produced any downward tendency.

Trade News

WAGES MOVEMENT.

THE NINE-HOUR MOVEMENT IN THE BUILDING TRADE.—The committee of the carpenters and joiners of London for carrying out the above movement have called an aggregate meeting of the trade for the 25th inst., when the new code of working rules, embodying nine working hours per day, at the present rate of payment, 8d. per hour, is to be submitted for approval and adoption. If agreed to, the code of rules will be printed and sent to every employer in the London district for their assent thereto, or, if necessary, a conference thereon. By reducing the working hours from 56 to 50 per week the men sacrifice 4s. per week in wages, but they look for compensation in more regular employment and less competition by a reduced surplus-labour market. The new code of working rules also abolishes piece-work and systematic overtime

TENDERS.

CLOWNE (DERBYSHIRE).—For the erection of a rectory house for the Rev. C. L. Helps. S. Rollinson, architect, Chesterfield.

Messrs. Waterlow and Sons (accepted)...£1057

BATH STONE OF BEST QUALITY.

RANDELL, SAUNDERS, and COMPANY, LIMITED. Quarrymen and Stone Merchants, Bath. List of Prices at the Quarries and Depots; also cost for Transit to any part of the United Kingdom, furnished on application.

BATH STONE OFFICE,
[ADVT.] Corsham, Wilts.

CONTRACTS OPEN FOR BUILDING ESTIMATES.

ST. MARY ABBOTT'S, KENSINGTON, Sept. 7.—For the erection of a new infirmary and other buildings adjoining their workhouse. Ruben Green, Clerk to the Guardians, No. 1, Devonshire-terrace, Wright's-lane, Kensington.

BRADFORD, Aug. 22.—For the various works required in the taking down the present buildings, and in the erection of the Boar's Head Restaurant, in Market-street. Milnes and France, architects, Cheapside, Bradford.

LANCASHIRE AND YORKSHIRE RAILWAY, Aug. 23.—For the erection of a stationmaster's house, and waiting shed at Sough Station; of a new station at Pemberton; and of a timber footbridge over the railway at Oldham. W. S. Lawn, secretary, Hunt's Bank, Manchester.

SWINDON, WILTS, Aug. 23.—For the erection of new parochial schools, with teacher's residence. Lansdown and Shopland, architects and surveyors, Swindon, Wilts.

CHORLTON UNION, Aug. 23.—For painting the whole of the outside work at the workhouse at Withington. Wm. N. Edgill, Clerk to the Guardians, Chorlton Union Offices, Grosvenor-square, All Saints', Manchester.

CLECKHEATON LOCAL BOARD, Aug. 22.—Gas Works Department.—For the construction of ten brick gas retorts. David Hirst, Clerk to the said Board, Cleckheaton.

CROYDON LOCAL BOARD OF HEALTH WATERWORKS, Aug. 30.—For the construction and erection of a condensing pumping engine. R. J. Cheesewright, Clerk, Town Hall, Croydon.

CROYDON LOCAL BOARD OF HEALTH WATERWORKS, Aug. 30.—For the manufacture and delivery at Croydon of cast-iron socket pipes. R. J. Cheesewright, Clerk, Town Hall, Croydon.

SHEFFIELD, Aug. 31.—For the erection of a villa residence, in Clarkhouse-road. Hill and Swann, architects, Times Buildings, Sheffield.

LEEDS, Aug. 24.—For the erection of six houses, at Armley, near Leeds. James Snowdon, architect, 78, Broomfield-terrace, Bradford.

LEEDS, Aug. 24.—For the erection of new offices for the Imperial Insurance Company, in Bond-street. Stephen Ernest Smith, architect, 39, Park-square, Leeds.

THE BUILDING NEWS.

LONDON, FRIDAY, AUGUST 26, 1870.

THE CASTLES OF HEREFORDSHIRE.

HAVING lately given a summary of the castles and castellated mansions in Shropshire, we propose now, in continuation of the series, to give a short account of those in the neighbouring border county of Herefordshire. Our principal authority is a work by the Rev. Charles Robinson, Vicar of Norton Canon, and chaplain to the Earl of Caithness (published by Longman & Co., of London, and Head & Hull, of Hereford), a work of careful research, illustrated with anastatic reproductions of pen-and-ink drawings of but moderate excellence.

The following alphabetically-arranged list of the castles mentioned by that author is in itself interesting, and may be useful to such of our readers as may be inclined to pursue their personal investigations among these relics of a byegone age. They have been hitherto treated, as Mr. Robinson alleges, with unmerited neglect, although many of them still present architectural details of a high order, and even a refined delicacy of execution and design. The list does not exclusively apply to the true castle or Norman fortalice, but embraces all fortified mansions erected before the union of the Houses of York and Lancaster to which the appellation of *Castra* has been given in documents :—

Almeley
Ashpecton
Brampton Brian
Bransill
Bredwardine
Clifford
Comfort
Croft
Cublington
Cusop
Dorston
Eardisley
Eaton Tregoz
Eccleswale
Ellingham
Ewyas Harold
Frome Castle
Goodrich
Hereford
Huntingdon
Kilpeck
Kingsland
Kington
Kinnersley
Lingen
Longtown
Lyonshall
Moccas
Mortimer's Castle
Pembridge
Penyard
Richard's Castle
Snodhill
Stapleton
Sutton
Tretire
Twyford
Wrishay
Weobly
Whitney
Wigmore
Wilton

Of these, certainly Goodrich, of which we lately gave an account, is the best preserved and most interesting.

Almeley, though utterly destroyed, deserves mention as having been the residence, according to tradition, of Sir John Oldcastle, Lord Cobham, the Lollard martyr of Brampton Brian Castle, which belonged to the Harleys. An entrance gateway of the time of Edward III., with low circular towers at the sides, remains. It has a pointed arch of good proportions, and a string-course above ornamented with trefoil ball flowers. There are also portions of the later domestic buildings in the interior of the court. A paper upon this structure, by Mr. R. W. Banks, is to be found in the "Archæol. Cambrensis," 3rd s., vol. xiii.

The ruins of Bransill Castle are in a glen of the Malvern Hills. It was a castellated mansion of late date—a quadrangle of about forty yards on each side, with octagonal towers at the angles, and a gateway on the western side ; and two moats twenty yards apart surrounded it ; and Croft Castle was a similar quadrangular building, with circular towers at the angles.

Hereford Castle was in circuit "nearly as large as that of Windsor," and "one of the fayrist, largest, and strongest in all England." It only now survives in the names of Castle Green, Castle Mill, and Castle-street, which occupy its site. Its plan is, however, easily to be gathered from Leland's description, and a view by Speed. Mr. Robinson thus describes it—"On the southern side the river Wye, the bank of which fell almost perpendicularly seven yards, formed a natural defence, and round the whole area of the castle ran a semicircular wall, defended with towers and strengthened with a wet moat. The entrance was on the north-eastern side, over a great bridge of stone arches, with a drawbridge in the middle ; and the eastern or outer bailey, to which access was thus gained, contained within it the chapel, the mill, and the barracks and stabling. The smaller or inner ward had also a strong wall and deep moat, and in it was situated the keep, built massively on a lofty artificial mound. It was from this side that attack was always most imminent, and hence the centre tower of the keep was raised high enough to command an extensive view, and, if we understand Leland's words correctly, was strengthened at the base by no less than ten turrets."

Longtown has still a grey keep-tower, standing in a wild spot backed by the Black mountains, and Mr. Bodley's authority is quoted by Mr. Robinson as to its having been erected prior to the Conquest, and there can be but little doubt that the site had been entrenched as a camp even by the Romans.

Pembridge, fortunately, is in a comparatively perfect condition, and a monograph upon it by the late Mr. Wakeman is in the "Cambrian Journal." It is quadrangular, about 45 yards by 35 yards, with a south entrance, guarded by towers of unequal size. The courtyard is entered through a passage 33ft. long. The keep and kitchen exist, and the great hall and a projecting square staircase turret are now occupied as a farmhouse. Some of the details are very curious, and the structure is well worth careful examination.

Of Snodhill Castle, which dates from the latter part of the twelfth century, some transitional Norman portions of the keep remain, and an Edwardian gateway.

The ruins of Wigmore Castle, which belonged to the famed Mortimer family, cover a large area. It has a Norman square keep, and an entrance gateway on the south, of which, as well as of the walls and their defensive towers, there are large portions remaining.

Of the other examples in the list given, but fragments, or often only the mounds upon which they stood, remain, so that, with the notable exception of Goodrich, Herefordshire can boast of little but the memory of its several strongholds, and we fear it is the antiquary, the lover of the picturesque, and the artist, who would profit far more than the architectural student by the investigation of what is left of them.

◆

WHAT HOLLAND IS DOING FOR HER WORKMEN.

THERE are admirable technical schools established in Italy, Austria, France, the German States, Belgium, Switzerland, and Holland. The last-named country presents special features of interest, for the reason that its endeavours in a manufacturing direction are of comparatively recent date, say within the last quarter of a century, and that its working classes were said to dispute with those of England the bad pre-eminence of being the worst educated in Western Europe. Their gas-works were executed by English companies, who not only took over their own engineers, but likewise all overlookers and fitters, and their railways were laid by English engineers, who took over their own workmen. After 1839 a change in the national feeling took place (which is by some attributed to rivalry of Belgium), and capital, which our Dutch cousins had previously kept invested in foreign funds, was withdrawn to set up manufacturing and industrial companies. But the capitalists found themselves in a difficulty, for want of intelligent workmen, and were driven to bring home a number of Germans. The Dutch workman was utterly unfitted for competition with these intruders, and the national apathy, combined with a great jealousy of state interference, and a fallacy which prevailed without being publicly avowed among the more influential classes, that the more ignorant the people are the easier they might be governed—all these things combined (some of them are remarkably like England !) prevented improvement for some years. The social earthquake of 1848, however, woke up Holland as well as other countries ; new men came into power, and among other things new educational laws were passed, although the friends of ignorance made violent opposition. At present, the secondary (or technical) instruction is regulated by the law of 1863.

The schools consist of (*a*) Burgher day or evening schools, intended for the working classes. These are mostly held in the evening, the boys being apprenticed as soon as they leave the primary school. The course of study, as regulated by law, is mathematics ; rudiments of theoretical and practical mechanics and machinery ; natural philosophy and chemistry ; natural history ; technology or agricultural science, according to the locality of the school ; geography ; history ; the Dutch language ; political economy ; ordinary and rectilinear drawing ; gymnastics ; to which the local authorities may add modelling, or the German, English, or French language. (*b*) Higher Burgher schools, for the education of masters, overlookers, the commercial classes, and, in short, all who are not intended for the army, navy, or one of the learned professions. The course of instruction in these schools, includes those of the previous class, and adds the subjects of mineralogy, geology, botany, and zoology, with more extensive studies of history and political economy, the rudiments of commerce and book-keeping. Besides these there are (*c*) the agricultural schools, in which the sciences relating to agriculture take a more prominent part, and (*d*) the Royal Polytechnic School at Delft, which fulfils the functions of an industrial university, giving the most advanced instruction attainable, and from which the Government architects, naval engineers, shipbuilders, mechanicians, and mining engineers are chosen.

The law provides that there shall be one at least of the class of burgher schools whereever the population exceeds 10,000, and 15 Government schools at least—that is, schools where the town contributes only a part of the cost of the building—in different parts of the kingdom. The burgher schools are supported by the towns, the higher burgher schools by the towns with a subsidy from the Government. Then there are the Government schools ; and private schools may even, upon certain conditions, claim a subsidy from the Government. The amount of the Government payments to individual schools varies from £420 to £570 a-year, and one at Maestricht receives about £850 per annum. Compared with this support our system of prizes and scholarships, and grants to teachers at South Kensington, is paltry and mean. The schools had in 1867 about 2,200 students, which was in about the proportion of 1 to every 1600 of the population. Our own Science and Art Department schools in the same year were attended by 10,230 pupils, or about one in 2540 of our population ; so that not only are the schools better supported by the Government, but they are much more largely made use of by the people. The boys enter at the age of 12 or 13 ; at the burgher schools their stay is for two years ; at the higher schools they stay from three to five years, and may enter the Polytechnic school after passing the examinations of the schools, below, at 18 or 19 years of age. There is as yet but one girls' school—at Haarlem.

The above facts are fraught with the deepest lessons, and every one of our readers should lay them seriously to heart while foreign countries are thus bestirring themselves, and even the Dutch, whom it has been our insular habit to look down upon as apathetic and sluggish as their own marshy streams, are so steadily working their way in advance of us by polishing up the best tool in their chest—namely, the living intelligent workman. If we do not pay serious attention to it we shall realize the fate of the hare in his race with the tortoise, and be beaten at last. At the same time the example of that plodding little nation affords us great encouragement; with all their backwardness of years ago, they have made very great and solid progress, and so may we if we only learn the lesson they teach us.

These remarks receive additional point from the circumstance that in the Workmen's Exhibition at Islington the department assigned to the Royal Netherlands Commission holds very prominent and honourable position. Every branch of industry is well illustrated, and the government, with that push which characterises it, has appointed a royal commission to supervise all the arrangements, which is well represented in the building itself by Dr. Bikkers, who is always ready courteously to explain to visitors the peculiar features of the collection under his management. Our own attention was specially attracted by the exhibition of the results of practical technical instruction given in a school for the sons of workmen at Amsterdam. This school is supported by a society partly benevolent in its nature, but which pursues its object in a most practical and common-sense manner, deserving of the highest praise we can give it, which is to counsel such of our readers as have means and opportunity to "Go and do likewise."

The society for Promoting the Interests of the Working Classes at Amsterdam ("Maatschappij voor den Werkenden Stand") was established in the year 1854, and is now under the patronage of H.R.H. the Prince of Orange. It classifies its labours under five divisions—namely, 1st. the scavengers' brigade, which undertakes the sweeping and cleansing of the public roads and thoroughfares, the gutters included, and thus affords employment to many persons of the labouring class in a work which, in this country, is usually left to the municipal authorities. 2nd. The benevolent fund, for affording relief to workmen temporarily disabled by accidents occurring in the exercise of their trade. The workmen employed by contributors only have a claim upon this fund, but in many cases it has been applied to relieve the widows and orphans of workmen killed by accidents. 3rd. The industrial school for the sons of workmen. 4th. Lectures for the working classes. These were first established in the year 1866. During the last winter a course of fourteen popular lectures was delivered to persons of both sexes in the Frascati Buildings. The number of the audience varied from 600 to 1000. The subjects embraced by the lectures were physics, political economy, moral philosophy, pedagogy, history, literature, music, and the fine arts. In addition to these, a course of four lectures on natural philosophy was delivered exclusively to working men at the "Keizerskroon," the audiences numbering about 400. 5th. The needlewomen's employment division. The society established this branch of its labours in 1867, and has operated till the present time by giving instruction in the use of the sewing machine, and by providing these machines for indigent women, who are expected afterwards to pay for them by small weekly instalments.

In addition to the above, the society has, from time to time, undertaken the organization of exhibitions of objects made by workmen in their leisure hours, and has awarded medals, testimonials, or similar distinctions to those who have excelled at these competitions; it has offered its own medals to artisans, who have obtained prizes at other exhibitions as an additional home distinction; it has partly defrayed the expenses of working men visiting the Paris Exhibition of 1867; it supports workmen's unions, and has given rewards to workmen for honesty and fidelity during a continued service in the same employ.

The school for workmen's sons is, however, the most interesting of these various agencies, its results being now exhibited on the walls at Islington. It was established in the year 1861, and receives a subsidy from the city of Amsterdam. In the year 1866 his Majesty King William III. presented the school with a large and important collection of models, implements, and tools. New buildings were erected in 1867 at the Weteringschams, on which occasion there was a great manifestation of public sympathy in favour of the school, Prince Frederick and the Government of the province taking part in the proceedings. There are 125 pupils, of ages varying from thirteen to sixteen years, the sons of working men, and thirteen teachers. The course of study embraces — carpentering, forging, turning, embossing, carving; rectilinear, architectural, machine, ornamental, and hand drawing, &c.; knowledge of building materials, lessons in physics, algebra, mathematics, and mechanics. The lads are kept to study from 8 a.m. to 8 p.m., with an interval at noon, so that their mechanical skill is entirely the result of the instruction received. The exhibition is, in fact, an example of what might be done by lads of sixteen, if systematically instructed in their future trades, without being left to the casual instruction gained from jobs which happen to come up in the daily practice of the workshop. It consists of articles in most of the branches of instruction above enumerated. There is a large portfolio of drawings, architectural and shaded; illustrations of carpentry, proceeding from the simplest to the most complex combinations; and elevations and plans of buildings and details of work, which would not discredit any architect's office; then there are some cable chains made of wrought-iron, and various iron implements forged by the hands of the boys; several articles turned in oak, portions of sash frames, and dovetailed carpentry very neatly and creditably done; several carvings in bas-relief in oak; models of architectural details (full size) in clay; turned articles in polished wood; a small bookcase with carved open work; a model of a timber roof, very neatly made; a portion of a carved stair rail with dovetail joints; a riveted iron pail; a staircase made of deal (ordinary size) and many other articles, all showing very careful and systematic teaching and considerable manual aptitude on the part of such young boys. In fact, we should be inclined to place much of the work shown on a par with that of our average journeymen, although it must not be understood as coming up to best work. There is no pretence about the articles shown, everything is left unpolished and rough, so that all jointings, rivetings and weldings may be fairly inspected. The instruction given in this school could not, we think, be substituted for the experience to be gained in a workshop during apprenticeship, nor do we believe it is proposed to do so, but it forms an excellent preparation for workshop life; the youngster who goes into a workshop from such a school as this, with a systematic knowledge of the rudiments of his trade, together with the intellectual acquirements indicated by the drawings and writings here shown, will not be the hinderer, to be snubbed and treated as a "necessary evil," which an English apprentice too often is, but he will be a real help to the master workman; and will be able so to utilise his further experience, that he will turn out a finished workman, with whom, unless they take a leaf out of the book of his instructors, the artisans of England will find it difficult to maintain a competition.

FAILURE OF COMPETITIVE EXAMINATIONS.

THE competitive system of examinations has received its first blow, and one of a very serious character. It has not only failed most completely, but also in a branch or department in which one would not have expected a want of success to take place. Had this misfortune occurred in some of the minor departments of the State, to which admission is now only gained on competitive terms,—had it been impossible to obtain an adequate number of letter-carriers and postmen under similar circumstances,—the matter would have been of little or no importance. But that failure should be so glaringly manifest in a department of the Crown service so prominent as the Indian Public Works is an event as unexpected as surprising. When, out of seventy-six candidates, only thirteen are declared by the examiners to be eligible for forty vacant appointments, it cannot be concealed that the system adopted does not work. That for the present the Secretary of State for India has renounced the intention of adhering to the competitive principle, may be gathered from the following copy of the official document issued by his authority to intended future competitors :—

[Copy.]

India Office, 1870.

Sir,—In reply to your application for information regarding the examination of civil engineers for service in India, I am to inform you that it is not probable there will be any future examinations similar to those hitherto held for that purpose. No further copies of particulars regarding the Indian Engineering Service will, therefore, be at present issued from this office.—I am, Sir, your obedient servant, W. T. Thornton.

We have ourselves received so many applications for information on this point that we have no doubt the publication of the above notice will be valuable to a large body of our readers. It is not so very long ago since all appointments of this and a similar nature were obtainable only through private patronage, and that which was denied to merit and ability was readily granted to ignorance when backed by interest and party spirit. When public pressure became so strong that the authorities could no longer take shelter in their usual red-tapeism, the competitive system was conceded, and was universally anticipated to prove a complete remedy for the evils of the *ancien regime.* It is somewhat unfortunate that those who urged with vehemence and pertinacity upon the Government this very step should be themselves the ones to exhibit their incompetence to undergo the ordeal they petitioned for. What could be justly said now if the Indian authorities reverted to the old course of action? What if they were to say—"We gave you a fair trial, every opportunity and facility for entering the service, and you failed most miserably to reach the standard required of you—a standard, moreover, that you were acquainted with at least a year before you went up for the examination?"

Those who are aware of the mildness of the actual professional training, and the small expense the candidates are put to to enable them to compete at the examinations in question, will readily bear witness to the just and impartial conduct of the Indian Government. So many colleges and schools are recognised by the Secretary of State for India as possessing efficient classes for the instruction of the candidates, that one or other of them must be everywhere accessible. Again, the certificate of any professional man having a shadow of practice is regarded as valid for qualifying his pupil to present himself, and no very deep scrutiny is instituted into his moral or social antecedents. There are many who view in this very leniency the cause of the ill-success that attended the competitors in July last, and there is a good deal of sound sense in the opinion. Everything is valued in proportion to the difficulty experienced in obtaining it, and it is certainly probable that our young engineers imagined the race would be an easy one because the road was made smooth for them. Bearing in mind what a host of schools and colleges there are the principals of which would be all naturally anxious to have their establishments recognised by the Secretary of State for India, it was impossible for that official to do otherwise than acknowledge among the many some who no doubt did not possess resources and capabilities equal to the occasion. It is not every school that has an engineering or surveying class worthy of the name, or can impart any real professional knowledge even of the most elementary description. As with the collegiate and scholastic establishments so with the professional men. Without instituting invidious comparisons and distinctions, too nice a discrimination could not be instituted between the certificate of Mr. A. and that of Mr. B., especially at a time when so great a dearth of work exists in all professions, trades, and occupations that many practitioners of first-rate ability and repute are doing little or nothing. But if these matters required delicacy and tact on the part of the authorities to deal with and to decide upon, there was no such obligation or task entailed upon the candidates themselves. They had nothing to do with individual pretensions, nor the interest of principals and head-masters. They were at perfect liberty to select any establishment they preferred, as well as the engineer whose service they were desirous of entering. From the results of the last examination we are sadly afraid that some of them made a very bad selection indeed. Parents and guardians are not always infallible judges on these subjects, and the loss of a valuable and permanent appointment in consequence of a desire to save a fee is a sorry specimen of the truth of the old adage "penny-wise and pound-foolish." Viewed in a purely commercial light, a permanent appointment, with an increasing salary attached to it, is worth the expenditure of so much capital, but there are some who expect interest without any investment of capital.

So signal a failure having attended the competitive system in the Indian Public Works Department, it is not surprising that the authorities should contemplate its abandonment and the substitution of another. The rumour set afloat some time ago, that an Indian College was to be established in London for the especial training of young engineers for Indian service, is, we have received from private information, no longer a rumour, but a fact. Whether this will altogether render a year's probation with a *bona fide* professional man superfluous or not remains to be seen. We adhere to the opinion that, however valuable the scientific education may be, no college or school in the world can teach a young man that which he can learn only in the office of an architect or engineer. The routine of the office, which is indispensable to a professional man, cannot be transported into the atmosphere of a college The peculiar technical and professional training and knowledge by which a man gains his living cannot be grafted upon a professor or an usher, whose duties lie in a totally different sphere of action. It may be urged that the establishment of this college is for preparing young men, not for the profession at large, but for a special service, and that the system of education which might suit them for the former would not be the best to adopt for the latter. There is a good deal of truth in this, but it tells rather against the establishment itself. Supposing that there are forty vacancies to be filled up every year, which would hardly be the case after the first three or four years, but, nevertheless, while that number did exist the pupils or the candidates would muster in all probability about a hundred. Out of this hundred only forty could succeed. Assuming that all these forty were able to obtain the minimum number of marks necessary to qualify them for an appointment, what is to become of the other sixty? After the limiting age they cannot compete again, and must, therefore, leave the college where they have been trained for a special service. While there they will have made no connection, and will not have the same chance of obtaining employment they would have had they entered the profession in the ordinary manner. In fact, the leaving the college will tell very forcibly against their future prospects, as it will be at once evidence of their incompetency to obtain an appointment in the Public Works Department, and it will be argued by many of those to whom they may apply for work that they are not suitable men to engage. Under these circumstances they will have but one course to adopt—that is, to commence the profession *de novo*. If the present limit of age—twenty-four—be adhered to under the new *regime*, this will be an expensive and somewhat hazardous experiment to attempt. That the mathematical and general scientific education at the new college will be of the very highest order, and well calculated to form the foundation of future technical information, there is no room to doubt. But there are not wanting numerous other establishments of a similar character where an equally sound scientific education can be obtained. Certainly, if we are to judge from the results alone of the examination in July, some of these do not seem to be competent to impart to their "alumni" the particular description of scientific knowledge requisite to enable them to obtain an appointment in the Indian Public Works. But, as we have before remarked, it was quite in the power of the candidates to make a selection which would ensure them efficient instruction. At the same time, in the interest of fair play, the whole blame must not be laid upon the scholastic and collegiate institutions. It is quite certain that out of so large a number of candidates there were some whom no amount of "coaching" could have "put through."

There is just one more point to be considered before we take leave of this important subject. Pending the establishment of this new college, what is to be done in the meantime towards filling up the twenty-seven vacancies that now exist in the Public Works Department? We may just hint that, in all probability, a supplemental examination will be held some few months hence, in order to afford a second chance to the previous unsuccessful candidates, and to others who may be desirous of competing for the appointments. Due notice of any such intended proceeding on the part of the India Board will be given in the usual manner, and those who may contemplate a second or first attempt will do well to "put themselves into training at once." It is impossible to avoid perceiving to what a prominence these Indian appointments have attained when they are considered deserving of the establishment of a special school of education for the intended candidates. Although not exactly everything that they might be in matters of pay and pension, yet ameliorations and changes are under the consideration of the Home Department which will go far to place the whole service on a better footing hereafter.

◆

SCULPTURES NOW IN THE LATERAN MUSEUM AT ROME, FROM THE TOMBS OF SUPPOSED ARCHITECTS; THE ATERII FAMILY.

WE have selected two of the photographs from Mr. Parker's series of the antiquities of Rome, which appear to us of special interest to the architectural profession. They are from the celebrated tomb of the Aterii, discovered in 1849 at Cento Celli, a district a few miles from Rome, full of tombs (from the hundred cells of which it is supposed to have been named). It was evidently a great burial-place in the time of the Emperors Trajan and Hadrian, and it is believed that Hadrian had one of his magnificent villas there also, as there is an aqueduct leading to it. These two photographs, of which we present lithographs, represent two interesting panels of sculpture of the first century of the Christian era, or beginning of the second; they are now preserved in the Lateran Museum. The first (No. 1,500 in Mr. Parker's catalogue) is extremely curious, as showing the manner in which the Romans in the time of the Empire, and probably during the earlier period also, raised their great blocks of stone, and placed them on the walls, without scaffolding. The sculpture represents a rich tomb, or a temple, of the first century, nearly finished but not quite, with the machine in question at the end of it in front of the portico, and two men placing a great stone on the summit; it is level with the top of a palm-tree, which is represented to show the height. The men are at the upper end of a machine very similar to a modern fire-escape. The stone is attached to the end of it when it is on the ground; it is then raised by means of a tread-wheel, in the place of the ordinary wheel. Inside of this tread-wheel five men are represented (and there may have been more, for the panel is broken off in the middle of the wheel). By their weight they lift up the ladder, with the stone at the end of it, until it is nearly vertical; it is attached to and guided by strong cords; each of the men stands on a sort of large pulley with one foot, and the other foot rests upon the cord. They hold the stone in their hands, which seems to be part of the cornice, about 2ft. or 3ft. wide and the same length. The tread-wheel does not rest upon the ground, but on blocks which are movable, and 5ft. or 6ft. high, as two men are represented under it, and the whole appears as being pushed up a flight of stone steps in front of the portico. Under this also is what seems to be intended for the plan of the inside of the tread-wheel. It seems not improbable that the whole design is imaginary, and it may represent the tomb of an architect. On this one panel there seem to be several designs represented—one, a temple, with a portico; another, a tomb, with a doorway; another, perhaps a *janus quadrifrons*, or small temple with four faces, and a cupola at the top with a figure under it, and other figures sculptured on both sides.

The other panel (No. 1,501) is equally interesting in its way, but more to scholars and those who study the antiquities of Rome than to the professional architect. It represents five buildings: the first, beginning with the left hand, is a triumphal arch, with the inscription ARCVS AD ISIS; the fourth in order is another triumphal arch, with the inscription on the cornice, ARCUS IN SACRA VIA SVMMA. In each case the figure of a warrior is represented under the arch, and other figures on the piers by the side, between the columns. Number two of this series is a portion of a large circular building of three storeys, which is looked down upon, as the top is shown. The lower arches are open, the others have sculpture in them. Next to this, in number three of the series, is another triumphal arch, seen end ways, with a figure under the arch, and a group of horsemen on the top of it. The fifth and last of the series is the portico of a temple of six columns, with a pediment and an attic, and again the figure of a god between the two central columns, as often represented on coins and medals. The portico stands on a lower level than the triumphal arch next to it. May we venture to conjecture that these five buildings are intended to represent a view of the Summa Via Sacra, or Upper Via Sacra, on which the Arch of Titus now stands (although it is singular that none of them correspond with that arch), and, therefore, that these stood to the south of that arch, in front of the Cliff of the Palatine; and that numbers two and three are intended for a distant view of the Colosseum, and of a triumphal arch that stood by the side of it, on the same site on which the Arch of Constantine now stands? It is well-known that in the time of Constantine old materials were used for building this arch, supposed to have been taken from the Arch of Trajan, on the entrance to his Thermæ. That opinion, we believe, rests upon tradition only, and the arch pulled down in the time of Constantine may have stood on the same site as the present arch. Another conjecture is that the sculptured panel also may be part of the tomb of an architect of the time of Hadrian, and may represent the buildings he had executed or had been employed upon.

In any case, these two pieces of sculpture are extremely interesting, and the profession are much indebted to Mr. Parker for making them known in England. We cannot but say that sufficient attention was not paid to these photographs by the profession when they were exhibited, and that the Royal Institute of Architects ought to have a set of them.

◆

THE PARISH CHURCH OF LLANBADARN-FAWR, NEAR ABERYSTWITH, FORMERLY THE CATHEDRAL OF THE ANCIENT SEE OF LLANBADARN-FAWR.

WHAT is known as to the ancient history of this interesting fabric has been succinctly described in the following remarks, which we quote from the appeal made to the public for aid to the fund for its restoration. "The earliest notice of this church in history is the arrival of S. Paturnus in A.D. 524.—(Padarn ap Petrwn ap Emyr Llydaw, Cefnderw i Gadvan,—'Bonedd y Saint,' Myf. Arch., Vol. II., p. 50.) He is said to have come over from Armorica, together with S. Cadvan, at the head of 847 monks.—('Lives of Cambro-British Saints,'* p. 189) According to 'Achau y Saint,' he became a member of the College of Illtyd. He afterwards established a college of 120 members at Llanbadarn-Fawr. Being abbot of the new institution, he appointed over it also a steward, a provost, and a dean. At the same place he founded an episcopal see, and was himself the first bishop. This office he held for 21 years, after which he returned to Armorica and became Bishop of Vannes. He is said to have built monasteries and churches throughout the region of Ceredigion.

"The southern boundary of the Diocese of Llanbadarn is supposed (*vide* Rees's 'British Saints,' p. 216) to be indicated in the present day by churches bearing the name of the saint. The line would thus start on the coast below Llanddewi-Aberarth, and crossing the Teifi at Llanddewi-brefi, would go up to Builth in Breconshire. On the southern side of this boundary we find numerous churches dedicated to S. David; and facing them on the northern side another series bearing the name of S. Paturnus or some of his companions. Churches dedicated to S. Padarn in the centre and north of Radnorshire carry the boundary of his diocese round the whole of that county, with the exception of the Deanery of Elvael, which is on the southern side. Numerous dedications to companions of S. Paturnus through Montgomeryshire, and the south of Merionethshire, create a slight probability that the southern portion of both these counties may have been subject to S. Paturnus's jurisdiction.

"The great church of Cardiganshire, Llanbadarn-Fawr, forming its central point, the limits of the see probably fluctuated with those of the principality of Ceredigion, whilst there is reason to believe that the district of Ceredigion extended at one time north of the Dyfi, so as to take in a part of Gwynedd, properly so called. ('Vestiges of the Gael in Gwynedd,' † p. 44) How long Llanbadarn continued to be a bishopric cannot be ascertained. The last notice of it under that character in the Welsh Chronicles is in the year 720, when it is recorded (Brut y Tywysogion, Myf. Arch., Vol. II., p. 472) that many of the churches of Llandaf, Mynyw, Llanbadarn, meaning the three dioceses of South Wales, were ravaged by the Saxons. The church of Llanbadarn-Fawr, after the cessation of the episcopate, retained something of a cœnobitic or collegiate character, to, at least the beginning, or more probably the middle, of the thirteenth century, in spite of an attempt at the commencement of the twelfth century to appropriate its revenues to the Abbey of S. Peter, Gloucester. We find Geofrey de Henelawe, Bishop of S. David's from 1203 to 1214, instituting a Rector of Llanbadarn without respect to the rights of the canons, 'an unexampled act,' says Giraldus Cambrensis, 'on the part of a bishop of S. David's.' ('Hist. and Ant. of S. David's,' p. 175.‡) Llanbadarn was finally appropriated in 1360 to Vale Royal (*vide* Lib. Stat. Eccl. Menev.)."

The following is an extract from the report of the architect to the committee formed for the restoration of the church, and describes its condition before the works recently done to it were commenced:—

"This stately and venerable fabric, once the cathedral of the ancient See of Llanbadarn-Fawr, is a cruciform church, consisting of aisleless nave, transepts and chancel, with a massive tower over the intersection. The style of its architecture is that of the early part of the thirteenth century, but the structure has evidently been nearly rebuilt at a subsequent date, after extensive injuries suffered from fire or through violence; the same design was, however, adhered to, and many of the older details preserved and re-used.

"The difficulty of ascertaining the original character of the church under such circumstances is rendered less by a comparison with other contemporary buildings in the principality, such as the Priory and Christchurch at Brecon, Ewenny Abbey, &c. All these exhibit these same general characteristics, extreme simplicity in the external features, combined with an admirable degree of finish in the masonry, and a comparative refinement and richness of detail in the interior. Llanbadarn Church, though one of the simplest, yields to none of these in point of the execution of those details that are evidently original, while it is surpassed by few in dignity of scale and proportion; its beautiful southern doorway, however, alone remains to show what the internal features may have been, which are now replaced by work of an entirely different and ruder class, as, for instance, the arches supporting the tower.

"The windows, though but simple lancet-shaped openings with chamfered edges, have dressings of the best description; and at the angles of both transepts are still remaining a few stones that show that the first building had a projecting moulding above the base and quoins of a corresponding character.

"The tower, which is evidently of a later date, as it has many older worked stones built into it, has, unfortunately, none of the usual weatherings to show the original pitch of the roofs; the present roofs, of indifferent character, are comparatively modern and much too low; the only clue to the former condition of these is, therefore, by reference to other existing examples.

"The church has fallen into a sad state of dilapidation from neglect and injudicious repairs. The nave roof, and the spire, in particular, are in an imminently dangerous condition from the decay of their principal timbers, and the side walls are tottering, from their outward thrust; in some parts they overhang the base 15in., and in others they are rent from top to bottom."

The view which we present to our subscribers in our present number is a reduction, by the photo-lithographic process, from a drawing made by Mr. Howard Gaye for the architect, and shows the building in the condition to which it is hoped before long it will be brought. The works which have as yet been executed are the restoration of the nave and rebuilding of the porch. The nave, as described in the architect's report, was in a most ruinous condition; yet as every stone of so ancient and interesting a building deserves to be preserved intact if possible, the first rumour of the intention to rebuild it provoked the jealous intervention of several eminent antiquaries, who knew and loved the old fabric. Notably among these was the late esteemed Mr. J. L. Petit and the Archdeacon of York. These gentlemen, however, upon the evidence laid before them, conceded the necessity of the proposed works, and as the committee entrusted the execution of them to a builder of great experience in such matters (Mr. Thomas Williams), in whom the architect reposed great confidence, all parties, though regretting the need, felt satisfied that it would be carried out in the proper spirit of conservatism. Accordingly, as much of the old walling of the nave as it was practicable to retain has been retained, and the rest rebuilt in exact conformity with the original design. During the works, most curious fragments of successive polychromatic and pictorial decorations were discovered upon different coats of whitewash, some evidently dating from the period of the erection of the church. Under the circumstances it proved impossible to preserve any of these, but Mr. Seddon has recorded them in a paper recently read by him at the Institute of Architects, and published in the transactions of that body. He also had a careful drawing made of the principal figure—a colossal S. Christopher—by the able hand of Mr. E. S. Cole, the architectural artist.

The porch had no antiquarian or architectural interest whatever, and its scale being mean in comparison with that of the church, it has been taken down and a new one erected instead, of a commensurate size and corresponding simplicity of detail to that of the church, from the design of the architect.

Our view also shows the spire which it is proposed to substitute for the present small and decayed one, and in the foreground are two ancient Celtic crosses, which are still preserved in the churchyard. The extreme beauty of the churchyard, with its grand old trees, probably coeval with the structure itself, is not the least of the attractions which Llanbadarn-Fawr holds out for the visitors to Aberystwith, for whose benefit during the season the vicar holds an English service on Sunday evenings. As efforts are about to be made to further the restoration so happily commenced, we would call attention to the fact, and express a hope that they may be liberally responded to.

◆

TRANSPORTATION OF EARTH.*

IN all constructions which require the movement of large quantities of earth, such as the establishment of a road, railroad, or canal, two questions have to be solved: one consisting of the determination of the mean distance of transport of earth, the other of the most advantageous *organization* of this transport. We shall first consider the former.

If V is the total volume necessary for a given cutting, the cost of transport is proportional to V; but it will also depend upon the distances to which the different portions of the volume V must be transported. Let v, v', v'', &c., represent the several elements of the volume V; d, d', d'', &c., the distances corresponding to these elements; then the expense of transport will be proportional to the quantity—

$$vd + v'd' + v''d'' +, \&c.,$$

Let D be such a distance that

$$vd + v'd' + v''d'' +, \text{etc.}, = VD; \; [1]$$

then D will be the mean distance of transport, and the expense will be proportional to the product V D. The determination of this mean distance is important.

The most simple and ordinary case is that in which the carriage is along a straight line. In this case the mean distance is the distance between the centres of gravity of the cutting and the filling. Let $\chi^0, \chi', \chi,''$.. ...X_0 be the primitive distances of the centres of gravity of the elementary volumes v, v', v'', and of the total volume to any fixed plane perpendicular to the axis of the route; and let χ', χ'', χ'''......X be the distances of the same centres to the same plane after transport. Then $d = \chi - \chi_0$; $d' = \chi' - \chi_0'$; $d'' = \chi'' - \chi_0''$;......therefore, equation [1] may be written:

$$v\,(\chi - \chi_0) + v'\,(\chi' - \chi_0') + v'' - (\chi'' - \chi_0'') + \ldots\,.. = V\,D;$$

or,

$$[v\chi + v'\chi' + v''\,\chi'' + \ldots] - [v\chi_0 + v'\,\chi_0' + v''\,\chi_0'' + \ldots] = V\,D.$$

Applying the principle of moments,

$$V\,X - V\,X_0 = V\,D$$

$$\therefore D = X - X_0;$$

which proves the above principle.

In applying this rule, engineers generally employ a graphic method. Let X X' (Fig. 1) be the axis of the route; and A, B, C, points at which the cross-sections have been determined. Suppose that the first profile, A, presents a section of cutting, d, and a section of filling, r; the second profile, B, corresponding sections, d and r; the third,

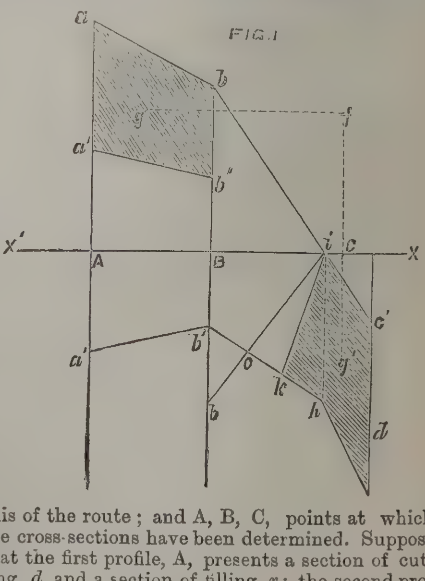

FIG. 1

---

* Published by the Welsh MSS. Society.

† By the Rev. W. Basil Jones, now Archdeacon of York.

‡ By the Rev. W. Basil Jones and Edward Augustus Freeman, Esq.

* Translated from Sonnet's 'Dictionnaire des Mathématiques Appliquées.'

C, a filling without cutting. If, through the point of change from cutting and filling in the profile B a verticle plane is supposed to be parallel to the axis of the route, it will divide the filling of the profile C into two parts; one, ρ, corresponding to the cutting d', the other, ρ', to the filling r'. Perpendiculars are drawn to X X′ at A, B, and C; A a, B b are laid off proportional to the areas of the cuttings d and d'; and A a', B b', C c', D d', proportional to the fillings r, r', ρ, ρ'. Connect by straight lines $a\ b$, $a'\ b'$, $b'\ d$, and $b\ c'$. The volume of the cutting between A and B is approximately

$$\tfrac{1}{2}\ (d + d')\ \mathrm{AB},$$

and is represented by the area of the trapezoid A a b B. The volume of filling between the same sections is represented by A a' b' B. Between the sections B and C we must first consider the volume of filling corresponding to the fillings r' and ρ'; it is represented in the drawing by the drawing by the trapezoid B b' d C; we must next consider an area corresponding to the cutting d' and the filling ρ. The distance x of the mean line of passage to the section B, being expressed by

$$x = \mathrm{B\,C}.\ \frac{d'}{a' + \rho} \text{ or } \mathrm{B\,C}.\ \frac{\mathrm{B}\,b}{\mathrm{B}\,b + \mathrm{C}\,c'}$$

must be equal to B i. Consequently the volume of the portion in cutting, being expressed by

$$\tfrac{1}{2}\ d'\ x \text{ or } \tfrac{1}{2}\ \mathrm{B}b.\ \mathrm{B}i,$$

is represented by the area of the triangle b B i. The volume of filling is represented by the area of the triangle i C c'.

Between two consecutive sections there is a partial compensation between cutting and filling consequent upon the carriage of earth perpendicular to the axis of the route, thus requiring no longitudinal transport. By laying off the trapezoid A a' b' B upon A a'' b'' B, it is seen that after the partial compensation just mentioned there will remain an excess of cutting corresponding to $a\ a''$ $b\ b''$. To obtain more conveniently the total filling between B and C, which is the sum of B b' d C and i C c', draw $i\ h$ perpendicular to X X′; make $d\,e$ = C c', and join $e\ h$; the triangle $d\ e\ h$ is equivalent to the triangle i C c', so that the total filling is shown by the polygon B C $e\ h\ b'$. Revolve the triangle b B i to b, B i, and put for the $b'\ o\ b$, the equivalent triangle $i\ o\ k$. The figure B b' k i is equal to b, B i, and the excess of the filling between B and C will therefore be represented by the figure $i\ h\ k\ e$ C. The centres of gravity g' and g of $a\ a''\ b''\ b$ and $i\ k\ h\ e$ C are found. We draw $g\ f$ parallel to X X′ and $g'\ f$ perpendicular. The distance $g\ f$ is the mean distance of transport.

This method is applicable, whatever the number of profiles, by carrying from one interval to the next the excess of cutting obtained by the partial compensation made in each interval. This expeditious process gives results sufficiently approximate, especially if the drawing is made to a large scale. The centres of gravity can often be determined by inspection without great error. It is not necessary to use the same scale for distances in the direction X X′ and for the distances set off perpendicular to this axis. Ordinarily the last are taken to the scale 0m.005 per square metre; the first are taken to the scale 0m.001, 0m 002 to the metre; sometimes to a smaller scale.

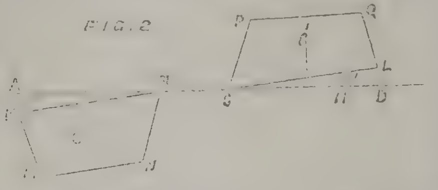
There is another case in which the mean distance of transport can be evaluated very easily; that in which the cutting or filling can be divided by vertical planes into equal corresponding slices. This happens in most of the terracing work in fortification. The relief of fortified works is formed by the earth brought forward from the ditch, so that a series of vertical planes perpendicular to the direction of the *line de feu* divide the fosse and the relief into sections of the same volume. In this case the distance between the centres of gravity of cutting and filling is the same for each section; it is equal to the distance between the centres of gravity of the force and of the total relief; and this is the mean distance of transport.

In other cases this mean distance can be determined only approximately, and its minimum can be found only by *tatonnement*. In general, engineers take approximate value of the mean distance, the distance between the centres of gravity of cutting and of filling.

We have supposed the direction of transport to be horizontal. When in going from cutting to filling it is necessary to go up a rising grade, this circumstance of course increases the work. In military engineering it is assumed that 20 metres of distance on a rising grade of 1-12th is equivalent to 30 metres on a horizontal; and the cost of transport is determined by this rule. Suppose b to be the horizontal projection of the distance to be passed over and h the height, the grade being 1 in 12, we have $b = 12h$; and the distance $12h$ on the rise is equal to $18h$ on the horizontal.

Let A M N B (Fig. 2) represent the section of an excavation from which earth is to be carried to fill the section C P Q D. Through the points B and C draw the lines B K and C L at an incline of 1 to 12; that is, at a horizontal angle of about 4° 46′. Let g be the centre of gravity of the triangle A K B, g' that of the triangle C L D, G that of the quadrilateral L M N B, G′ that of the quadrilateral C P Q L; h, h', H, H′ the distances of the several centres from the horizontal A B C D; let fall upon this horizontal the perpendiculars g I and g' H. Consider the volumes corresponding to the same length of excavation and embankment perpendicular to the plane of the figure. Earth must be brought to the point B, carried from B to C, and spread over the entire surface of the embankment. It may be assumed that the work is the same as if the volumes were concentrated at their centres of gravity. According to this supposition, in order to bring the earth from the prism A K B to B, a volume v must be moved a distance compounded of I B, horizontal distances, and $6h$, taking rise into account. The product of the volume by the distance is

FIG. 2



$$v\ (\mathrm{IB} + 6h)$$

while the corresponding product for carriage from B to C is

$$v.\ \mathrm{B\,C}.$$

For transport from the point C to the several points of the prism C L D of volume v', we shall have

$$v'\ (\mathrm{CH} + 6h').$$

Let V represent the volume of the prism K M N B, and V′ that of the prism C P Q L; then the product for transport to the point B is

$$\mathrm{V}.\ 18\mathrm{H};$$

from B to C the product is

$$\mathrm{V.BC}$$

finally, for transport from C to all points of the prism C P Q L, the product is

$$\mathrm{V}'.18\mathrm{H}'.$$

In order not to pass the inclination 1 in 12, the line of distribution of the volumes V and V′ must be extended by making them follow the slopes made upon the interior talus of the excavation and upon the talus. These slopes are divided into lengths of 20 metres, so that each receives 10 metres of distribution from either end. The centre of gravity of the volume received or distributed is then 5 metres from the slope. Hence 5 metres must be added to the distance of transport of each of the volumes V and V′; so that the total sum of products of volumes and distances is

$$\left.\begin{array}{l} v\ (\mathrm{IB} + 6h + \mathrm{BC}) + v'\ (\mathrm{CH} + 6h') \\ + \mathrm{V}\,(18\mathrm{H} + \mathrm{BC} + 5\mathrm{m.}) + \mathrm{V}'\,(18\mathrm{H}' + 5\mathrm{m.}) \end{array}\right\} \ldots[2]$$

This sum, divided by the total volume $v' + \mathrm{V}'$, will give the mean distance of transport.

The first two terms of formula [2] can generally be neglected in comparison with the other two, unless either the excavation or the embankment is broad and shallow. When these terms can be neglected, we have $\mathrm{V} = \mathrm{V}'$, and the formula reduces to

$$\mathrm{V}\ [18\ (\mathrm{H} + \mathrm{H}') + \mathrm{BC} + 10\mathrm{m.}];$$

the mean distance of transport in this case is

$$18\ (\mathrm{H} + \mathrm{H}') + \mathrm{BC} + 10\mathrm{m.}, \qquad [3]$$

that is, it is 18 times the difference of levels of the centres of gravity of the cutting and the filling, increased by the distance from the edge of the cutting to the foot of the filling, increased by 10 metres.

If the ground rise from B to C, H being the difference of level of the points G and B, H′ that of the points G′ and C, z that of the points B and C, we have for mean distance of transport

$$18\ \mathrm{H} + \mathrm{BC} + 6z + 18\ \mathrm{H}' + 10\mathrm{m.},$$

or

$$18\ (\mathrm{H} + \mathrm{H}') + \mathrm{BC} + 6z + 10\mathrm{m.},$$

which amounts to adding, according to the rule given above, 6 times the difference of level of the points B and C.

On the other hand, if the ground descend from B to C, we should apply formula [3] without taking this circumstance into account, unless the point G′ does not descend a level equal to or less than that of B, in which case it is only necessary to add 18H + 10m., the horizontal distance from the points B and G′. No account is taken of the descending slopes.

When the earth has to be removed only 2 and 4 metres in a horizontal direction, or from 1·6 to 2 metres in a vertical direction, the transport should be made with the shovel. For greater distances the wheelbarrow is used, and the carriage is done by relays; the quantity of earth is said to be *a un seul homme*, if a single labourer can load a barrow while another runs over a relay of 30 metres, going and returning. The quantity of earth is said to be *a un homme et demi* if it is necessary to have two loaders to one digger to feed two barrows running over the same relay. The earth can be *a deux hommes* or *a trois hommes*. In general, if T denotes the time occupied by a pickman to dig a certain volume of earth, and t the time for a loader to load the same volume upon a barrow, the ratio $\frac{\mathrm{T}}{t}$ expresses the number of pickers necessary that a loader may work without interruption. The number necessary to supply a wheeler is

$$\frac{\mathrm{T}}{t} + 1 \text{ or } \frac{\mathrm{T} + t}{t}$$

and the quantity of earth is said to be to

$$\frac{\mathrm{T} + t}{t}\ \text{men.}$$

As to the length of the relay, it is determined by the following considerations: It is assumed that a wheeler can run 30,000 metres in a day of 10 hours, and that a loader can load 20 cubic metres in the same time. The ordinary capacity of a barrow is 0m.04; *i.e.*, 25 barrows to the cubic metre. If x denotes the distance run by the wheeler while the loader fills a barrow, we have

$$20 : 0{\cdot}04 :: 30000\mathrm{m.} : x$$
$$x = 60\mathrm{m.}$$

The half of this distance, 30 metres, is the length of the relay. This is about the same in all localities, while the capacity of the barrow varies, according to the country, from 1 33rd to 1-20th of a cubic metre. It is desirable to know the time necessary to transport a cubic metre the distance of a relay. As the wheeler runs 3,000 metres an hour, he wheels a double relay of 60 metres in 0h 02; but in this time he carries 1-25th of a cubic metre; to carry a cubic metre a distance of 30 metres, he will require a time

$$0\mathrm{h}.02 \times 25 \text{ or } 0\mathrm{h}.50.$$

For longer distances the hand-truck (*camion*), dumping cart (*tombereau*), or waggon (*wagon de terrassement*) is used. The hand-truck has a capacity of 20 cubic metres, and is usually drawn by men. The relays are about 100 metres, or it requires 20 minutes to carry a cubic metre over this distance The capacity of the dumping cart varies from 0·50 to 1·50 cubic metres; it is drawn by one or by two horses. About 20 minutes are employed in moving a cubic metre over a distance of 100 metres, by means of a cart of mean capacity, loading and unloading included.

For longer distances, waggons (or carts) are employed, drawn by horses or a locomotive, and the transport is not made in relays. At Clamart, on the Versailles Railway, the waggons had a capacity of 1 50 metres. Three horses dragged 10 of these, with a velocity of 25,000 metres, in 10 hours. A locomotive dragged 20 with four times this velocity. In each case there was a loss of 10 minutes each trip for loading and unloading. The road had an inclination of 0m.004 to the metre. On a horizontal road five horses instead of three would have been necessary. The barrow or the truck is generally employed for distances of less than 100 metres; the dumping-cart for distances from 100 to 500 metres; waggons drawn by horses, from 500 to 2,000 metres, and for greater distances, cars drawn by a locomotive. In mountainous countries the earth is often carried on the back of a labourer or a mule; in the first case panniers are used, of a capacity of about 0m.01; in the latter case each pannier has a capacity of about 0m.04.

When earth has to be moved in a vertical direction, the shovel should be employed, if possible, for heights not exceeding 1m.65. The labourers, one above the other, at this interval, can raise, in 10 hours, 15 cubic metres to a height of about 5 metres. Another method, almost as good, is carriage by the basket, by aid of a ladder. A labourer can make 27 trips of 3 metres height in an hour, carrying in all 8·10 cubic metres a distance of 3 metres—a result nearly equivalent to the former; for, multiplying the volume by the height, we have, in the first case, 72·9; in the second, 75.

Sometimes panniers, called *bourriquets*, are raised by a drum. The capacity of one of these is 0·033 cubic metres. The drum is from 15 to 20 centimetres in diameter, and from 1m. to 1m.2 in length. The crank is 0m.4 long. The rope which carries the panniers is 0 03m. in diameter. By means of this apparatus, 15 cubic metres can be raised to a height of 5 metres. A similar method is employed in tunnelling work.

◆

ANOTHER THEATRE FOR LONDON.

Many of our readers will doubtless remember the mania which prevailed a few years ago for the erection of gigantic hotels by limited liability companies. Many of those projects were most disastrous to the unfortunate shareholders, and it is to be hoped, for the sake of those concerned, that the present rage for theatre-building in London will not be attended with the like misfortune. By a curious coincidence, the walls which were to enclose a large hotel now include within their limits two theatres. The mere half-finished brick carcase intended for the Strand Hotel stood idle and ruin like for several years between Holywell and Wych streets. After a time, the ground floors were utilised as shops, and let to booksellers and others, and last year about half of the internal area of this huge carcase was appropriated as the site of the Globe Theatre. On the remaining half of the interior of this block another theatre has now been for some months in course of erection, and it will probably open at the end of September or beginning of October. This new theatre will, we understand, be devoted to burlesque, extravaganza, and *opera bouffe*, end will be totally distinct from the Globe Theatre, and under different management. The backs of the stages of the two theatres abut on each other, and are divided by a solid brick party wall. The stage of the new theatre (which has not yet been given a name) is 32ft. deep. The whole of the space which in former days would have been called the pit is appropriated to stalls. This space, or pit area, is however, very limited, as there is no headway under the first tier or balcony, which is to be named the stall tier, and which rises up solid from the ground, the top of the balcony or box-front being only 6ft. or 7ft. from the floor of the pit or stalls, so that a person in the pit (otherwise stalls) could easily shake hands with one in the first or stall tier. Above the stall tier, at a good elevation, is the grand tier or dress circle; and above this, again, is the final tier, appropriated to "amphitheatre" and "amphitheatre stalls." It is estimated that 1,600 persons may be comfortably seated in the auditorium. This new theatre will have an advantage over the Globe, inasmuch as it will have its principal entrance in the Strand, nearly opposite Surry-street. This is effected by means of a subway which passess from the new theatre, beneath Holywell-street, to the basement of a new building in the Strand. This basement will be luxuriously fitted up and decorated to serve as a crush-room, and will be approached by a broad flight of steps, leading from the vestibule. We understand that in constructing the subway from the theatre to the Strand the workmen came upon traces of the Old Holy Well, from which Holywell-street derives its name. Besides this principal entrance in the Strand, there will be other entrances from Wych-street and Holywell-street. The decorations will consist principally of carton-pierre work, with the ceiling and the space over the proscenium painted with allegorical subjects. The whole of the decoration is under the direction of Mr. Bradwell. The gaslighting will be effected by means of a sun-burner. From the peculiar shape of the house (that of a flat horse-shoe). a good view of the whole or nearly the whole of the stage will be obtainable from every seat. Special precautions have been taken to secure efficient ventilation, and the carrying off of the products of gas combustion. Mr. F. H. Fowler, of Fleet-street, is the architect, and Mr. Read the builder.

◆

SANITARY WORK IN MARYLEBONE FOR 1869.

Dr. WHITMORE'S sanitary reports are always valuable, not only as records of good work done, but for the practical suggestions for further improvement frequently embodied in them. In the report for 1869, now before us, the table shows that 2,361 houses were visited during the year, and of these 1,262 underwent sanitary improvement. The length of new pipe drain laid down to supply the place of old and defective brick drains was 8,014ft. Water was laid on to 447 closets; 1,481 yards and areas were cleansed and limewashed, and many of them repaved, and a great deal of other work of a like nature was completed. Besides all this, the bakehouses, slaughter-houses, and cow-houses in the parish were periodically visited, and the necessary sanitary measures enforced. Manure heaps were removed, roofs repaired, and food unfit for human consumption destroyed in large quantities. The quantity of unsound fish alone destroyed amounted to 3,599lbs. The great difficulty in the way of sanitary improvement is undoubtedly, as Dr. Whitmore asserts, the want of proper house accommodation for our labouring poor. In this respect matters are year by year getting worse; the poor are increasing, but there is no corresponding increase in the class of houses appropriate to their means; on the contrary, everything in the shape of local improvements, and indeed of metropolitan improvements, tends to diminish their number. But with all these improvements, with all our great undertakings for the adornment of the metropolis, we have done absolutely little or nothing for the improvement of the houses of those who construct our Embankments and make our streets. "Until this be done" says Dr. Whitmore, "we shall have but small cause indeed for pride or satisfaction in the architectural beauty, and still less in the healthfulness of London."

ANCIENT SEPULCHRAL MONUMENTS IN BANGOR CATHEDRAL.

Mr. M. H. BLOXAM, F.S.A., writing to the *North Wales Chronicle* on the 17th inst., says:—

There are but few ancient monuments in Bangor Cathedral, and amongst them there is not now a single recumbent effigy. What those mutilated sepulchral effigies may be that lie buried, as I have been informed, within the rails of the communion-table in the choir, whether of some of the ancient bishops or of other persons, I know not. I am told that they were thus deposited about forty five years ago. Should the restoration of the Cathedral be extended thus far, I trust they will be exhumed, and not the less cared for because in a mutilated condition. They may turn out to be those of benefactors whose names ought to be had in remembrance.

The most ancient monument, a sepulchral slab, was found in the restoration now going on, forming the base of an Early English buttress. Taken from its original position in the thirteenth century, it was then thus used. An old church is in these days rarely pulled down for re-construction, but fragments of an older building, or of ancient sepulchral slabs, are found worked up in the walls. This ancient stone has an incised cross of the S. Cuthbert fashion, resembling in outline the pectoral cross of Anglo-Saxon worship found with the remains of S. Cuthbert in Durham Cathedral. This is, I think, certainly not later than the twelfth century; it may be of the eleventh century. The cross is within a circle, and the spandrels are ornamented with a rude resemblance cf a *fleur de-lis*. This stone is uninscribed.

In the south wall of the choir, near the west end, is a sepulchral arch, moulded and pointed This of the fourteenth century. Beneath it is a stone coffin of the same period; the space hollowed for the head is not, however, round, but pointed. In the south wall of the aisle, eastward of the north transept, is another sepulchral arch of the fourteenth century. Of this, however, little is at present visible.

The best preserved ancient monument is within the south wall of the south transept. Here, beneath a plain sepulchral moulded arch of the fourteenth century, on a high tomb, is a coffin-shaped slab, wider at the head than at the foot. On this, sculptured in relief, is a rich floriated cross. There is no inscription on this tomb. Eastward of this monument, in the south wall, near the east end of the transept, is a piscina, or water-drain, indicative of a chantry chapel here placed: and the tomb is, in all probability, that of the founder. The archives or episcopal registers of the Cathedral would, I think, furnish a clue as to the worthy of the fourteenth century of whom this tomb was commemorative. I do not think he was one of episcopal rank. Had he been the "*Baculus pastoralis,*" the emblem or symbol of the office would probably have been sculptured upon it.

Buried outside of the Cathedral, and discovered during the progress of the present restoration, was the mutilated bust of a bishop of the early part of the seventeenth century. This is now placed temporarily in the choir. The head and arms are gone, but the vestments are clearly developed. He is represented as vested in the rochet and chimere, with the academical tippet worn over the shoulder and hanging down scarf-like in front. This bust is rudely sculptured in what appears to be a kind of clunch. It is, however, even as a mutilated fragment and record of the past, deserving of being carefully preserved. Brown Willis, in his survey of this Cathedral, published in 1721, treating of the choir, says:—"On the north side are the effigies (or rather busts) of two bishops, viz., Bishop Vaughan and Bishop Rowland, which are put close to the wall, though they seem to be in a niche. The effigies are of alabaster, with a sweep of the same materials from the waste (waist) upwards in their habits, each upon a cushion, the hands of one in a praying posture, the other with one hand akimbo and the other resting on a Bible. Their heads were beaten off in the time of the Rebellion, but the inscription, which is on black marble, and was put up by Bishop Rowland a little before his death, is still remaining." He then gives the inscription, a lengthy Latin epitaph, commencing with "*Piæ memoriæ duorum Episcoporum in hac ecclesia proxime succedentium,*" &c. Bishop Vaughan died in 1607, Bishop Rowland in 1616, in which latter year the monumental busts were set up. Of which of these two worthies this mutilated torso may be commemorative it is difficult to say. It is of a class of monuments introduced early in the seventeenth century, and of which that of Shakespeare, in the church of Stratford-upon-Avon, has been considered as an early example. Shakespeare died in 1616, the very year these busts were placed in the Cathedral of Bangor.

◆

COMPETITIONS.

The Metropolitan Railway Company's Surplus Lands.—We are glad to see that the directors of the Metropolitan Railway Company are losing no time in carrying out the plans referred to in the last report for disposing of the surplus lands which have for so long a time been imposing a heavy burden on the company. Premiums are offered to the following amounts for the best designs for the utilization of the building estates on the company's line from Moorgate-street to Brompton:—The company's Barbican estate, 70 guineas; Smithfield estate, 100 guineas; Farrington road estate, 50 guineas; Clerkenwell estate, 50 guineas; King's Cross estate, 50 guineas; Edgware-road estate, 50 guineas; Praed-street estate, 50 guineas; Linden-grove estate, 50 guineas; Campden-hill estate, 50 guineas; South Kensington estate, 50 guineas. Plans of the above estates may be obtained at the company's offices, and designs are to be submitted before the first of October next.

◆

The New Forest.—A correspondent, writing on the subject of the New Forest, says that before the Crown can claim one inch of the soil as its own, the claims of the commoners (whose number is legion) must, as long as law exists in England, be redeemed. These commoners hold 67,000 acres of freehold land in and around the Forest, to which are attached rights of common over the 63,000 acres of Crown lands. Their claims are the very reverse of encroachments; their origin is distinctly known, and proved to have existed before William Rufus made a forest. To redeem these commoners' rights would absorb more than half the acreage of the New Forest.

THE THEORY AND PRACTICE OF MODERN HOUSE PAINTING AND DECORATION.

By An Experienced Workman.

PREPARATORY PROCESSES.

(Continued from page 137.)

FLATTING should never be used thick on large surfaces, because the turps evaporates so quickly that it is impossible to make a good job if it is so used. In laying the colour on the wall it should be worked in strips, as before described, and so quickly as to keep the edges soft or wet, so that the one will work sweetly into the other, and thus leave it free from shady places. On large surfaces, such as staircase walls, &c., this is very rarely successful, unless the work is stippled. Stippling brushes are of different kinds and sizes. Those about 6in. square are the most useful for general purposes. Some are made with the handles crossing the back; in others the handle is formed in one piece with the back; but the most useful brush is the reversible stippling brush recently introduced by Hamilton & Co. The handle is attached by a screw turning in a brass plate fixed on the back of the brush; by loosening the screw the brush can be reversed, thus enabling the workman to obviate the uneven wearing of the bristles. The pressure in working a brush of this kind naturally bears more upon one side than another, and thus the brush becomes unequal-sided, which defect this simple invention effectually prevents. In stippling, the colour is laid on pretty freely in the usual manner, and spread as even as the time will allow, but it need not be so particularly done as if it were to be finished without stippling, because the stippler spreads the colour and leaves it equal. The brush is held in the right hand and the work is gently dabbed or stippled with the extreme ends of the hairs, which spread the colour evenly over the surface, leaving it with a slightly roughened face, but also with a solidity and uniformity which cannot be attained by any other means.

In painting a wall in any tint of colour after the first or primary coat—which we have before said is best of a reddish tone of colour—the wall should be brought up to the finishing coat with each successive coat lighter than the one preceding. We thus form a more solid body of colour, for it is an indisputable fact that tints of colour will cover better and appear most solid if we paint each coat a few shades lighter than the previous one. But if we reverse this course, and paint a dark tint upon a lighter one, there will be a want of solidity, and a streaky appearance about it, and it will, technically speaking, "grin," the light colour appearing through the darker one.

In flatting large walls the men should be so arranged one above the other that they can paint a strip of the wall, as before named, from top to bottom. By this means a good and solid job may be made, however large it may be; but except this be done the wall is sure to be shady. Great care should be taken that nothing is missed, for if any part is omitted, or a small patch in a wall over looked, the whole of that wall is spoiled, it being a peculiarity of flatting that it cannot be retouched without the same being distinctly seen. Flatting colour, if touched after it is set and before it is dry, will be glossy, or partially so, in every part where it has been touched, and, therefore, if a part of a large wall be touched or missed in flatting it necessitates the wall being redone—that is to say, the wall will have to be painted with the gloss colour and reflatted, for flatting upon flatting never makes a good job.

When old walls have to be repainted, they should first be repaired and then washed down with a weak solution of ordinary washing soda and water, in order to clean off all dirt, grease, gas-smoke, &c., &c. We thus insure the first coat drying and being clean. It will be evident to the meanest comprehension that this method is better than to fasten all the dirt and filth with a coat of clear-cole (which is a very common but a very bad practice) and then paint over it. If the wall has to be flatted, the first coat should be mixed with two-thirds turps; the second, gloss, or oil colour, to receive the flatting. It may be taken as a rule that new walls cannot be made a good job under five coats, and they are much better with six, while walls being repainted always require three coats for a good job.

In the painting of woodwork it is necessary to proceed with much more care and greater nicety in the working, and more skill and practice in the manipulation will be required. In painting new woodwork the first care should be to see that the work is well dusted, for in even the best joiners' work a large amount of fine dust results from the wood being rubbed smooth with glass paper, and this penetrates and lies in the quirks and behind the mouldings, and if great care is not taken to clean it well out it will be taken up with the paint brush in working, and thus make the work rough. Before commencing painting the knots in the wood should be "killed," in order to prevent the resin from oozing out from them, or from discolouring the paint. It will often happen that when the knots have been imperfectly covered they will, after a time, make their appearance in yellowish brown patches through five or six coats of paint. There are several modes of what is technically called "killing" the knots, and preventing them again making their appearance. Red lead and strong glue-size, mixed together and used hot, is an effectual cure, but this method cannot be used on good work, because its necessary thickness forms a projection on the surface, which cannot be got rid of except by filling up the whole of the work to the same level. Patent knotting (*i.e.*, shellac and wood naphtha), as its name indicates, is made expressly for obscuring knots, but it is used for many purposes besides. The knot requires to receive a strong coating of this substance, but the projection thus caused is not so objectionable, being smooth and very little above the surface of the wood. A very effectual method is to cover the knot with a coating of gold leaf in the ordinary manner; this is almost a certain cure, and of course has no projection; but when the knot is large, or very full of resinous turpentine, the only safe plan is to cut out the knot and let in a piece of wood in its place. There is, in fact, no other radical cure for a bad knot, or for most knots which are much exposed to the direct rays of the sun or heat. Before the wood is painted the quirks should be examined to see that there be no rough places left from the plane. If there are any they should be rubbed smooth with sandpaper, which will be much more easily done at this stage than afterwards. Doors, architraves, and all panelled and moulded woodwork, require painting with care in order to produce good work. The same rules will apply (in degree) to new woodwork as to new walls, in so far as the first coat should be more oily and have less white lead in it than any of the subsequent coats; if there is more lead in the priming than is necessary the wood absorbs the oil so quickly that the lead gathers on the surface, and in laying off gets thick and streaky. The quirks, edges of fillets, and mouldings should be well looked after, so that there be no "fat edges" left, *i.e.* thick ridges of paint caused by the brush being caught on the sharp edges in laying off. The work should be carefully rubbed down between each coat with fine sandpaper. It is well before using the paper to rub two pieces of it together or against each other; this serves to take off the sharp edge of the sand or glass, and thus prevents it scratching the paint. If great care is not taken in rubbing down the mouldings and sharp edges, they will be rubbed bare and the paint taken off, which causes them to look bad at the finish. All nail holes and other uneven places should be stopped, and faced up with hard stopping. Ordinary glaziers' putty will suffice for common work. It is a good plan to use the badger-hair softener to finish laying off the paint upon panels and stiles of doors, &c., as it obliterates the marks of the brush better than any other means. The stippler is very rarely used on woodwork, as it leaves a roughness not suitable for such work. In painting a door in flat colours it is best to paint the panels first, then the stiles; but in doing the stiles they will require to be quickly worked, or else the colour accumulates at the joints of the cross rails and stiles, and makes a ridge which should be avoided. We have found it best to commence at the bottom and bring on the stiles and cross rails together. We thus keep all sweet and wet together, and avoid the accumulation at the joints. If the quirks are tinted a different colour from the mouldings and stiles they should be picked in before the stiles are done, in order to keep all sharp and clean.

(To be continued.)

THE TREATMENT OF OPEN SPACES IN LONDON.

OPEN spaces with us are called squares, while in America they have hitherto been known as parks, and on the Continent as promenades. In London these are, as a rule, not quite so satisfactory as they might be, owing chiefly to the ground in them not having received in the first instance proper preparation for the reception of the shrubs and trees with which they are planted. In a few instances, however, we have some fine specimens of trees in our metropolitan squares and other open spaces. In the gardens belonging to Gray's Inn, for instance, there is a noble Catalpa, which, on account of its being reputed to have been planted by Lord Bacon, is called the "Bacon tree." Its aged limbs sweep the ground of this garden, which is six acres in extent, contains a noble walk, called Queen Elizabeth's Drive, and some good elms and plane trees, one of which is stated to have been planted by Addison. This garden during half the year is thrown open to the children of the neighbourhood, who so thoroughly enjoy the treat that when they get home in the evening after rolling on the grass they are as black as negro minstrels.

Nothing delights a townsman so much as to get his feet upon soft turf, a gratification which thousands of all ages enjoy. This fact receives daily verification in S. James's Park, which can claim to be little more than an open space laid out rather prettily in the gardenesque style, and evidently with a view to public instruction as regards acquiring a knowledge of the correct names of trees and shrubs. These were, I believe, selected, arranged, and named by Don, somewhere about a quarter of a century ago, but now the grouping together of families, which was the system of arrangement that botanist employed, is in a great measure lost sight of; still attention is paid to labelling, an operation which adds interest to the shrub-masses in this park. Here, too, on the lake is an excellent collection of waterfowl, the feeding of which affords a never wearying source of enjoyment to children, and even to older spectators. As far as extent goes, S. James's Park must be admitted to be one of the most popular of London open spaces in which entire freedom of grass-promenading is permitted.

Lincoln's Inn, a fine town square of 7 acres in extent, unlike S. James's Park, is closed to the public, which is to be regretted, for to look upon the merry faces of the young on a fine summer's day in such places does one's heart more good than the small degree of quietude their closed condition can ever afford. In this square are a few fine planes and thorns. The shrub masses are mostly privet, relieved by pelargoniums and similar flowers in summer, and by chrysanthemums in autumn.

The Inner and Middle Temple Gardens, remarkable for their annual displays of chrysanthemums, afford examples of fine open town spaces. Here, during a certain period of the year, children are admitted to romp and play on the grass as they please. The late Mr. Broome, the well-known advocate for throwing town enclosures open to the public, asserted that although there were often as many as 11,000 children daily in these gardens, neither flowers, shrubs, nor trees received any injury. The Temple Gardens, therefore, indicate the way in which open town spaces can be utilized for public benefit.

Setting aside the open spaces just adverted to, the newly-made parks of Finsbury, Southwark, Kennington, and others, there are still plenty of other squares, as, for instance, Berkeley and Grosvenor-squares, which, if open to the public, would be real boons to the thickly-packed inhabitants of the neighbourhood. But they are not open, and it is of this we have to complain. Closed as they are at present, they are, in fact, obstacles in the way of direct transit from one point to another; "they do things better in France" and other Continental countries, as well as in America, in which all have free access to such places, and in which recreation is as much sought for as in the parks. In London, it is true, there seems of late to be a disposition to improve its town spaces, and to throw them open to the public, but much in that way must yet be done before a perfectly satisfactory result shall have been arrived at. Among our town spaces lately opened and ornamented may be named Paddington and Islington-greens, Camberwell-green, and others, the use of which is evidently appreciated by the public. But it may be said, Who is to maintain and keep in order our open spaces? I say some body of management similar to the Board of Works, to which some power in the matter has, indeed, already been given, but as yet it has been inoperative, else surely we should not have had so long such a standing disgrace among us as Leicester-square, and others to which allusion might readily be made.

As regards the treatment of town squares, I am of opinion that they should be wholly planted, or very nearly so, with trees of a stately character, which will grow up so as to allow people to promenade under them. In this way the most would be made of the space, which should consist wholly of walks, grass, trees, and a few low shrubs here and there. Fountains and basins with fish should also be provided, not in order that they may throw water to a great height, but tastefully constructed drinking-places supplied from hydrants, to which, likewise, should be attached a hose for washing the trees and watering the turf. In this way the French manage to keep their grass and trees in beautiful condition, and without such an arrangement no London square, owing to the constant treading which it must necessarily receive, can ever be maintained in a fresh and green state. Without washing, too, trees loose their leaves much earlier than they otherwise should do, and when young especially their success is comparatively uncertain, owing to the over drainage to which towns are subjected. Flowers, as a rule, I would reject, though in some places their introduction might not only be admissible but necessary. Thus, when private right in the matter of town squares shall have yielded up its interest for the public good—when it shall have allowed our at present enclosed spaces to be opened, those frequently unsightly shrub masses to be removed so as to increase the grass surface—when broad, good, and dry walks shall have been made, and plenty of seats provided, then, and not till then, shall we acquit ourselves as Englishmen in this matter. Our thoroughfares are being yearly enlarged and improved, let, therefore, our squares be opened and improved also. They will then not only form delightful retreats for the aged and infirm from the more active scenes of public life with which they are surrounded, but will furnish healthy breathing spaces second only in importance, in a sanitary point of view, to our great parks themselves.—J. Newton in the *Gardeners' Chronicle*.

◆

THE WOLSEY CHAPEL AT WINDSOR.

MRS. MARK PATTISON, in a recent number of *The Portfolio*, describes the works of Baron de Triqueti, in the Wolsey Chapel at Windsor, as now far advanced. The walls, right and left, are filled with marbles, and only the east end is vacant. At a sufficient distance from the ground to admit of seats being fixed beneath them, range, panelled on either side, a series of Scriptural subjects selected by the artist as illustrative of the acts and virtues of the late Prince Consort:—

In reference, for instance, to the interest taken by the Prince in the matter of popular education, w have Jehoshaphat directing the teaching of the people by the princes, priests, and Levites. These pictures are executed in inlaid marbles and lithographic stone, which affords a very valuable tone for decorative purposes. The cartoons for them, on completion, are transferred to the marbles, which are then deeply etched, and the lines filled in with a composition (unlike the mastic previously used) as durable as marble itself. Each picture is bedded in a deep-toned marble framework, inlaid with floral designs, and enriched by small reliefs in white, and by medallions in red marble of the obverse and reverse of the coins of the year in which the event depicted happened. For instance, beneath "The Agony in the Garden," the obverse and reverse of the coin of Tiberius occur. Derbyshire spars employed occasionally in this portion of the work impart an unlooked-for brilliancy to the whole. White marble medallions of the children of the Queen and Prince, executed by Miss Durant, are introduced above each picture, and separating each, but embedded in the same decorative frame, come reliefs of the various Virtues.

M. de Triqueti, says Mrs. Pattison, has fulfilled his difficult task with equal fidelity and taste. The subjects treated are of general interest, though susceptible of special application by those deeply concerned. The compositions which make the least pretension to pictorial effect have been the most efficiently rendered in the sober scale of tints afforded by the materials employed:—

In such materials a blaze of colour is impossible, but a vast variety of delicate and subtle harmonies lie within reach especially adapted for rendering serious monumental design. Though at present lamentably disturbed by the garish paint and gilding of the ceiling, and the equally garish glass of the windows, the general effect of the marbles promises to be rich and harmonious. The execution by one man of a scheme demanding such varied attainments must necessarily leave something to be desired, however versatile his powers. The drawing can hardly be characterized as thorough, and has probably suffered much in the process of transferring the cartoons to marble. But whatever may be lacking, the work of the Baron de Triqueti is conceived in the spirit of a genuine artist without reference to profit or applause. What has been done at Windsor has been achieved by legitimate methods, and the completion of this memorial work will be the inauguration of a new and valuable idea in the world of decorative art.

THE ARTISANS' AND LABOURERS' DWELLINGS ACT.

THE Artisans' and Labourers' Dwellings Act, empowering vestries and district boards to take down or improve dwellings occupied by working-men, is producing beneficial effects in S. Luke's parish. Upwards of fifty houses have just been brought under its operation, and the object of the Act successfully accomplished. The Act gives very arbitrary powers, which are required to be exercised under special formalities. It provides that if any premises are found by the officers of health to be in a condition or state dangerous to health, so as to be in his opinion unfit for human habitation, he is to report the same in writing to the vestry, and such report is to be referred to the official surveyor, who shall thereupon consider it and report to the local authority what is the cause of the evil so reported on, and the remedy, whether the same can be remedied by structural alterations and improvements or otherwise, or whether the whole or part ought to be demolished. Copies of these reports are to be forwarded to the owners of the premises, a time and place is to be appointed by the vestry for their consideration, and the owner is to be at liberty to attend and point out any objections that he may have to make. In the event of an order not being complied with by the owner, it is provided, subject to appeal, that the vestry shall, as the case may be, either order the premises to be shut up or to be demolished, or may themselves execute the required works in conformity with a specification to be prepared by the surveyor, and, shall the vestry think proper to execute the works, provision is made for the recovery of the costs and expenses. There has only been one case reported in the parish of S. Luke wherein the owner of premises refused to comply with the orders of the vestry, and intimated his intention of appealing to the Quarter Sessions, but on further reflection he deemed it prudent to carry out the order, and has since converted the dwelling-houses into stables.

AMERICAN SLATES.

ALTHOUGH large deposits of slate have been known to exist in the United States, but little has been done to develope them until within the past few years; yet they are now assuming pretty considerable dimensions. The slate region of Vermont consists, according to the *Mining Journal*, of a belt of country lying about midway between the Hudson River on the west, and the foot-hills of the western slope of the Green Mountain range on the east. A strip of land, 20 miles long, and 3 or 4 miles in width, having Poultney, Vermont, for its centre, would cover all the quarries of any value that have been opened. This belt lies, in fact, partly in Vermont and partly in New York. It is about 60 miles from Troy, and about 9 or 10 miles from the foot of Lake Champlain. The slate formation itself is much more extensive than this, extending the whole length of the slate. This deposit of argillaceous rock belongs to what is known in the records of geological history as the Devonian period, and, consequently, occupies a very low position in point of time in the scale of geological formations. This slate formation has an average strike (say) of north 15° east, with a very varying dip eastward, ranging from about 15° to 55°. The stratification of the beds is not, of course, uniform throughout. At some points it is very irregular, and, therefore, not adapted to the manufacture of good roofing-slate; at others it is remarkably even, and affords material in almost inexhaustible quantities for slate of the very best quality. There does not seem to be a very large admixture of foreign mineral matter accompanying the slate beds. Of those that are found, however, may be mentioned veins or threads of calcspar or carbonate of lime, quartz, and now and then traces of iron pyrites, either in an arborescent or crystalline form. The former cut across the planes of stratification of the slate rock, and are often so numerous as to render the slate beds wholly worthless, in so far as the manufacture of roofing-slate is concerned; but, fortunately, these veins are only of local occurrence, and quite limited in extent, so that when, in the working of a quarry, they are encountered, they are considered an evil to be got rid of at a greater or less cost, rather than a permanent obstacle in the way of the further development of the property.

The number of quarries at present in operation in the Vermont slate district is about 100, which may be divided according to their geographical position into distinct groups. In the Middle Granville group there are about a dozen quarries now being worked, all, with one exception, making roofing slates. The predominant colours of the slates manufactured in this district are red, purple, green, and variegated. Considerable pyrites is found—more here, perhaps, than in any of the other districts. It is well worthy of mention that in this group are located the only quarries of red slate to be found in the country, if not in the world. The slates obtained from it are of the very best quality, being very smooth, fine-textured, and unchangeable in colour. They are used only for ornamental work, in connection with the purples and greens; and, on account of their scarcity, bear in the market nearly double the price of the ordinary coloured slates. The Jamesville and Hampton group is to the northward of that just mentioned, and likewise in Washington county, New York. The slates are here very irregular, both as regards colour and quality; mottled green, perhaps, predominates. As to texture, this group furnishes, upon the whole, a finer grained slate than the Middle Granville Quarries. The slate from this circle of quarries is shipped at Poultney, in Vermont, on the line of the Troy and Rutland Railroad.

The Poultney group, which is the most extensive of all, is still further to the northward, and situated in the State of Vermont. There are here about thirty quarries being worked, and devoted for the most part, with the exception of the Eagle Quarry, to the manufacture of roofing slates. From the quarries of this Poultney group the finest roofing slates in America are, perhaps, produced. The great body of them consist of fast-coloured purples and greens. The stock from which they are made is very fine grained; in fact, as good as any that the country affords. A large number of slates are made from these quarries. They are sent to the market, in greater part, from Hydeville, about midway between Whitehall and Rutland, on the Rensselaer and Saratoga Railroad. This may be considered the chief group in importance, as it is the central one in position of all the quarries in the district. At Fairhaven, to the north-west of Poultney, there are about a dozen quarries, some producing roofing slates and some producing slabs; and to the eastward of Fairhaven are the Castleton Quarries, producing all slabs. Of the 30 quarries that make up the Poultney group there is but one in the hands of an incorporated company, the rest being held by private owners; and as an evidence of the value of the slate formation in this locality for roofing and other purposes, it may be remarked that some 20 of these quarries have been opened within the last three years, and nearly all of them are doing well. Among the Fairhaven quarries the Scotch Hill is the principal. This is in the hands of a Boston company. In the last, or Castleton division, are found, as the more prominent, the West Castleton, Cookville, and Billings quarries. It is the practice throughout the district that the slabs are worked by mill companies in many instances, not the owners of the quarries; they buy the stock in the rough from the quarrymen, and send it to market in the form of billiard beds, mantelpieces, and the like.

In the Vermont district quite a number of Welshmen are employed. They are very successful in their works, many of them having come into possession of quarries, which they carry on themselves, and generally with success, owing, perhaps, to the fact that they thoroughly understand the business. As yet very little machinery is employed in getting out the slate from the quarries, or in splitting it up into sizes suitable for roofing purposes, though some attempts in that line are at present being made. Machinery is very extensively employed in finishing it for mantelpieces and other purposes.

The immense deposits of slate in Pennsylvania are extensively worked. The largest and most northerly of these is that situated in Northampton and Lehigh counties. The great shipping points for this region are Slatington and Walnut Port. In these two counties, Northampton and Lehigh, there are some 300 companies engaged in working slate quarries. South of this is the Peach Bottom region, in Pennsylvania and Maryland. From these regions is supplied most of the slate that comes to tide water. Slates from this part of the country are of a firm texture, split readily under the chisel, and are dark blue in colour. Another slate region exists in Brownville, Maine, some forty miles north-west from Bangor. The slates obtained from these quarries are of a uniform black colour, hard and durable. These quarries labour under the disadvantage of being some forty miles from railroad or shipping point. These slates do not usually come further west than Boston, on account of the great cost of transportation, &c. Several railroads are, however, in course of construction, which will give an outlet for this industry.

◆

THE ROMFORD SEWAGE FARM.

THE irrigation of land by sewage is a subject which has of late become of great interest and importance, especially in Essex, and on Tuesday week last some further proofs were received, in addition to those already obtained, of the great success with which the refuse of towns may be applied to the improvement of the soil, and of the great increase in the produce thereof under such treatment. On the occasion referred to a party of gentlemen, amongst whom were Mr. E. Chadwick, C.B., Mr. H. Corbet, Mr. R. Rawlinson, C.B., Mr. J. G. Fanshawe, Mr. J. M. Grant, C.E., Colonel Hogg (Metropolitan Board), Mr. A. Johnston, M.P., Mr. E. B. Eastwicke, C.B., M.P., Mr. T. W. Keates, F.C.S., Mr. J. H. Lloyd, Sir T. B. Lennard, Mr. J. B. Denton, C.E., Mr. B. H. Adams (Metropolitan Board), Mr. R. Morgan, C.E., Mr. W. Russ, C.E, Mr. B. Gooch, Mr. A. Tod, Mr. C. Freeman, &c., with several members of the Romford Local Board, had been invited by Mr. W. Hope to visit Breton's Farm, Hornchurch, which has been purchased by the Romford Local Board of Health for the disposal of their sewage by irrigation, and let to Mr. Hope, the well-known lessee of the sewage of London. The main object of the visit appeared to be for the purpose of inspecting the result of the application of sewage to the land and crops, which has, notwithstanding the difficulties which surrounded him in the first place, been carried out with a great degree of success under the skilful management of Mr. Hope. On the arrival of the company at the house, they at once proceeded to look over he farm. One of the first crops to which attention was drawn was a piece of Italian rye grass, sown on March 19, since which four crops have been cut, averaging 7½ tons per acre, and sold for £1 per ton on the ground. Close by was a piece of Dalmahoy potatoes, planted on April 2, which were producing upwards of 1½cwt. per rod, and worth about £25 per acre. Some of these were very large. Some "Early Rose" kidneys were also shown, which produced ten or twelve at each root, many being from 4in. to 7in. in length. Some beans and peas, sown on April 2, produced, the former £9 and the latter £15 per acre, without the straw. Another piece of rye grass, sown April 9, will be ready to cut for the fourth time in a few days. Next came some dioscoreas or yams, planted on June 6; adjacent to these were some very large Jersey cabbages, about 5ft. in height; these, if successful, and under favourable circumstances, may reach a growth of 10ft. A little further on there was a specimen patch of clover, sown on May 23, which was very thick, and about a foot high. Adjoining, were about four acres of transplanted mangold-wurzel, looking rank and strong. Another crop of the same kind exhibited some very fine roots, many of the globes being over two feet in circumference, and some of the long two feet in length. Close to these was a crop of parsnips sown on the 28th April, which averaged from 1½in. to 2in. in diameter, and of a proportionate length; also a fine crop of cauliflower planted on the 19th July. Some fine carrots, crimson beetroot, and runner beans are also growing. We may here add that the runner seed, as well as that of several of the other crops, was of such bad quality that a great deal did not grow at all, so that there are occasionally bare patches of ground. In addition to those already named there were some fine pieces of bunching and other kinds of cabbage, which promise good crops, having been planted about the middle of June, and being very regular. A strip of a newly imported kind of grass, called *Bromus odoratus Australiacus*, was sown on the 4th June, and was cut on the 1st August: this, if the trial proves successful, it is expected will, to a great degree, supplant the Italian rye grass, being perennial, and lasting much longer than the latter. Following this comes a fine crop of maize, or Indian corn, for ripening, sown on the 2nd June: it averages from 3ft. to 4ft. in height, some of the heads reaching nearly if not quite 5ft. A strip of American oats looks very fine, though somewhat laid by the recent storms; these are said to produce 20qrs. per acre. Close by was a crop of intermediate carrots, about 4 acres in extent, sown on the 4th of April, a month later than they ought to have been. Some of these have already been cleared off and sent to market, where they fetched at the rate of £41 per acre. Those that still remained had been sold as growing at £21 per acre, it being worth the additional amount to prepare and get them to market. The above may be considered as the principal crops, but there are many others, most of which have been put in for purpose of trial, and are not large in extent, but all appear to be more or less successful. As each crop is labelled, showing the time of planting and the results that have been achieved, the beholder cannot but be astonished at the rapidity with which the various crops have sprung up, and reached their present state of growth.

With regard to the manner in which the sewage is put upon the land: it is first pumped to the top of the engine-house, and then conveyed in sheet-iron troughing to about the centre of the farm, where it branches off in all directions, there being outlets at short intervals, which can be opened for the discharge of the liquid or plugged up, or even set to a certain quantity, as required. The sewage eventually flows into channels of concrete or earth, and thence again into smaller off-shooting channels which run along in the crown of the beds, the ground having been originally laid out in proper inclines; these smaller channels are then dammed up where required, and the sewage overflows the beds. Of course, there is a large amount of effluent water which percolates through the soil, and this is carried back again in a state of purity to the tank, or down to the river, at pleasure, by drain pipes laid at a depth of 6ft. from the surface, and at a distance of 150ft. apart.

The effluent water was clear and sparkling; most of the company drank some of it, pronouncing it excellent, and we were informed by Mr. Hope that it not only compared favourably with the well water of the district, when tested with permanganate of potassium, but that it also resists even Reinsch's new test, which is generally considered by chemists one of the most delicate tests yet discovered. Though the system and works are not so complete as they will be after a time, yet, judging from the present appearance of the crops, there can be but little doubt of the success of the project when it shall have been carried out in its entirety; and we cannot but congratulate the board and the ratepayers of Romford on being the owners of what appears to be so valuable a property, and one that will render such large returns.

On this occasion the company were much assisted in their investigations by Mr. Russ (of the firm of Messrs. Russ and Minns, engineers, who designed and executed the outfall works), who attended and explained their nature and cost, &c., and gave every information in answer to the numerous inquiries addressed to him, as did also Mr. J. R. Harding, the board's surveyor, and Mr. Avis, the bailiff on the farm.

It is stated by the *Essex Times* that the sewage of Romford is conveyed by a culvert nearly three miles in length from the town on to the farm by gravitation, and is then pumped about 23ft. high into carriers, and distributed in the manner before described.

◆

ARCHÆOLOGICAL.

WILTS ARCHÆOLOGICAL SOCIETY.—The visit of the Wilts Archæological Society to Wilton on the 14th, 15th and 16th proximo promises to be of unusual interest, both in regard to the papers announced to be read and the excursions which have been planned. On the first day the chair will be taken by Mr. C. Penruddocke, who will open the meeting with his inaugural address as President of the Society. This will be followed by a paper by the Rev. D. Olivier, "On Wilton Church," and by a paper by Mr. W. W. Ravenhill "On the Trial of Colonel Penruddocke, of Compton, at Exeter, for high treason, and the surrounding circumstances." After this an opportunity will be given to visitors to inspect Wilton Church and Wilton House. The usual dinner will then take place, and at the *conversazione* in the evening Mr. Nightingale will point out and explain the objects of interest which are to be visited in the excursion of the following day; to be followed by other papers by the Rev. G. S. Master and the Rev. W. H. Jones. On Thursday the excursionists will lunch at Ferne with Mr. T. F. Grove, M P.; after which they will visit Wardour Castle, Place Farm, Fonthill Gifford Church, Fonthill Abbey, Fonthill House, Fonthill Bishop Church, Chilmark Church, and Compton House, where the company are invited by the president to a picnic dinner. The next morning will be devoted to the South Wilts and Blackmore Museums, where the party will take lunch with Dr. Blackmore and Mr. E. T. Stevens. In the afternoon there will be an excursion to Longford Castle, S. Nicholas's Hospital, and other objects of interest in the neighbourhood, returning to Wilton at five o'clock.

OLD BRIDGE AT TAUNTON.—An interesting relic of antiquity has just been saved from destruction in this neighbourhood. The object referred to is an old bridge, called Ramshorn Bridge, crossing the stream at Galmington, and commonly supposed to be of Roman origin. The bridge having become so worn on the crown that holes appeared and it had become dangerous, the highway board took it in hand and repaired it with bricks, &c, entirely destroying its character. The attention of some members of the Somersetshire Archæological Society was drawn to the subject, and the result was that a subscription was entered into among some friends in order to restore the bridge to its original state. This has now been done, the bricks having been removed and replaced by hewn stone in character with other portions of the bridge.

◆

BOOKS RECEIVED.

The Practical Solution of the Great Sewage Question, by William Justyne (London: J. B. Day), is a compilation embodying the leading principles and results of the different schemes for the utilization of town sewage. A careful investigation of the irrigating and precipitating processes has led the author to the conclusion that in a proper combination of them is to be found the real solution of the sewage problem.—*Land and Houses*, by John Parnell (London: Effingham Wilson), is a tract having for its object the enabling investors in houses and land to form some idea of the various natures of investments, stripped of all legal and professional verbiage. A series of very useful tables is added.—*Stables and Stable Fittings* is issued by the S. Pancras Iron Company and contains hints for the erection and proper maintenance of stables, founded on the principle on which their stable fittings are constructed.—*Sussex Archæological Collections*, published by the Sussex Archæological Society (Lewes: G. P. Bacon), Vol. xxii., is the yearly record of the transactions of the Sussex Archæological Society. It is always a respectable and fairly illustrated volume, and generally contains papers of interest to all archæologists. In the present volume Mr. Turner's paper on the Mural Painting recently discovered in Wisborough Green Church is especially interesting.

Building Intelligence.

CHURCHES AND CHAPELS.

Aberystwith.—A new English Baptist Chapel was formally opened for Divine Service on the 11th inst. The building is situated on an elevated site in Alfred-place, and holds a central position in the town The style of architecture is a harmonizing combination of Early English and Gothic. The building seats from 450 to 500 worshippers, and has been erected in a most satisfactory manner by Messrs. Lewis Evans & Son, builders, from plans prepared by Mr. Richard Owen, architect, of Liverpool.

Burton-on-Trent.—The foundation stones of a new Wesleyan Chapel were laid on Wednesday week. The style adopted will be Gothic, of the Early Decorated period. The plan of the chapel is in form a parallelogram, being 60ft. long on the ground floor, 84ft on the gallery, and 51ft. in width. The main body will be divided into four bays by light iron columns with moulded capitals. The accommodation provided will be for 860 adults, and it is expected the work will be completed by the end of August, 1871. The builder is Mr. George Lilley, of Ashby-de-la-Zouch, and the stonemason Mr. David Bassett, of Burton-on-Trent, whose joint contracts, including the tower and spire, amount to £3,365. Mr. Edward Holmes, of Birmingham and Burton, is the architect employed.

Bury St. Edmunds.—A handsome oaken lectern, executed from the designs of Mr. A. W. Blomfield, architect, by Mr. Lot Jackaman, of Bury, has been presented by the latter gentleman to the church. The lectern stands on a graduated and moulded base, the upper portion of which is enriched with quatrefoil cusping. From this rise half-a-dozen moulded buttresses (three on each side), which are surmounted by carved and crocketed finials. Between these is a reproduction (or nearly so) of one of the Perpendicular windows of the church, the spandrels being filled with foliated ornament. The desk is supported on either side by five brackets, three of which are handsomely carved, and correspond in position with the crocketed finials, whilst the two intermediate ones are plainer in character, and have for their terminations the carved pendants at the western angles of the desk. The spaces between the brackets are relieved with foliated ornament, and the mouldings are enriched by pateræ, &c. The front of the desk terminates at either end in an octagonal support, and is composed of a frieze pierced with quartrefoil tracery of a varied character, the sacred monogram occupying the centre: the ends of the desk are filled in with similar tracery.

Dudley.—A new Wesleyan Chapel was opened on Tuesday week. The façade of the chapel is effective, the centre being broken by the introduction of three wide arches, forming the front of an open portico, supported on carved caps and moulded columns. A large wheel window forms the chief feature of the centre gable. The front is flanked on the one side by a tower and steep slated spire, and on the other by a continuation of the principal front. The façade is further broken up by means of buttresses, and flat buttresses relieve the plainness of the sides. The chapel is built of red brick, relieved by Bath stone dressings. The total cost has been £3,000

Fylingdales.—On the 3rd inst. the Archbishop of York consecrated the beautiful new church of Fylingdales, a parish which includes the well-known Robin Hood's Bay. The church is from a design by Mr. G. E. Street, A.R.A., and has cost £6,000

Highbury.—On Saturday the new and handsome church dedicated to S. Augustine, situated in the Highbury New Park, was consecrated by the Bishop of London. The church, which consists of a nave, chancel, and side aisles, with a western tower, is built in the Early Gothic style, and the interior has been expressly designed to present an open and uninterrupted view to a large congregation. The nave is divided from the north and south aisles by five bays, with Gothic arches and clustered columns with carved capitals supporting a well-lighted clerestory. The roof of the nave is open, but the chancel ceiling is ceiled with timber. The edifice is constructed of brick, with ashlar work and stone ornamentation. The structure will accommodate about 1,300 worshippers, without galleries, and it has been erected at a cost of nearly £10,000. Messrs. Perry and Co., of Stratford, have been the builders, and Messrs. Habershon and Pite the architects.

Kellington.—On the 29th ult. the Archbishop of York re-opened, by a confirmation, the parish church of Kellington, which has been completely restored under the direction of Mr. Crossland, architect, Leeds.

Lightcliffe—On Monday afternoon two daughters of Sir Titus Salt laid the memorial stones of a new Congregational Church at Lightcliffe. Erected in the Geometric Decorated style of Gothic, the church — the plans for which have been furnished by Messrs. Lockwood and Mawson, of Bradford—promises to prove an elegant as well as substantial structure. It will consist of nave, side aisles, transepts, and organ chapel. At the west end of the nave will be a gallery for the school children, and at the eastern end vestries for ministers, deacons, and ladies. A tower, surmounted by a spire, will rise at the south-west angle of the building to a height of 150ft. The greatest through length of the church is 87ft., the width across the nave and aisles is 50ft., and across the transepts 66ft. The seats will accommodate 500 adults and 70 children. Internally the nave is divided from the aisles by polished columns of Shap granite, resting on moulded stone bases and supporting carved capitals, from which spring moulded ashlar arches. The transept and organ chamber arches are also of moulded ashlar, and spring from detached cylinders of Robin Hood stone, supported on carved and moulded stone corbels.

Lincoln—The ceremony of laying two memorial corner-stones of the new chapel for the Baptist congregation worshipping in Mint-lane, Lincoln, took place on Thursday week last. The building is being erected by Messrs. Barnes and Wright, builders, from the designs of Messrs. Drury and Mortimer, architects, and has a superficial area of 2,040ft., with 600 sittings. It is designed in the modern development of the Romanesque style, and is arranged in three stages—the lower, containing the two entrance doorways and the triplet window, lighting the centre body of the chapel. The second stage is occupied by a well-marked window, lighting the gallery floor; and the upper stage consists of an arched opening, combined with an arcaded coping to the gable. The interior is proposed to be fitted with open seats, and the conveniences of arrangement for the peculiar rites of the chapel have been much improved. The entrance passages on the ground floor will be paved with Maw and Co.'s geometrical ornamental tiles.

Litlington.—The interesting church in the village of Litlington, Cambridgeshire, is now being restored and renovated, under the supervision of Mr. Vialls, of London. Mr. Gimson, of Royston, is the contractor, the stonework being done by Mr. Whitehead.

Longbridge Hays.—The foundation stone of a new school-church at Longbridge Hays, a hamlet on the slope of the hill near Bradwell Wood, in the parish of Wolstanton, was laid on Saturday week. The building to be erected will seat 180 worshippers and accommodate 125 children for educational purposes. It will be 42ft. by 20ft., with a classroom 16ft. by 14ft. Mr Lewis, of Newcastle, is the architect, and Messrs. Bennett and Cooke, of Burslem, have contracted to do the work.

Newtown.—The foundation stone of a new Primitive Methodist Chapel was laid at Newtown recently. The chapel, 39ft. in length by 30ft. in breadth, will be built of brick, with blue stone plinth, the windows and the door frames being of Bath stone. Mr. Thomas Davies, Welshpool, is the contractor for the brick and mason work, and Mr. Black for the woodwork. The estimated cost of the erection is about £700.

Oldham.—The foundation stone of the new church of S. Andrew, Oldham, was laid on Saturday afternoon, by the Bishop of Manchester. The ground plan of the church, the site of which is at the corner of Middleton-road and Terrace street, comprises a nave 73ft. long, 29ft. wide, and 58ft. high, with lofty arches supporting the clerestory; side aisles 13ft. 10in. wide, and south transept. The chancel, 27ft. by 22ft., adjoins Terrace-street. The style of architecture will be the Early English. Sittings are to be provided for 638 persons, and of these 516 will be free and unappropriated. The estimated cost of the structure is £3,300. The architect is Mr. John Lowe, of Manchester.

Overton.—The chancel of Overton Church has lately been restored. Externally a new gable and cross have taken the place of the old carved ones, with angle buttresses added; internally a new chancel-arch has been erected in place of the old wooden cut arch. The pews and the floors have been renewed, the chancel being paved with Portland stone, with borders and steps of Anglesey marble. The floor within the communion rails is of Sicilian marble, with Anglesey border. Several of the windows have been filled with stained glass by Messrs. Clayton and Bell, of London. The works have been executed by Mr. John Edge, of Overton, from designs by Mr. W. M. Teulon, of London.

Warsash.—On Tuesday week the foundation stone of the church about to be erected on Hook Common, near Warsash, Hants, was laid. The church will be dedicated to S. Mary, and will have accommodation for about 300 persons. Mr. Raphael Brandon, of the Strand, is the architect. The building will be of Swanage and Bath stone, in the Early English style of architecture, and the expense about £3,000. There will be no spire, but a bell-cot at the western gable; there will be porches at the north and south side. Internally the structure will comprise a nave, north and south aisles, organ chamber, chancel, with vestry on the north side, and semi-decagonal apse.

Yafforth.—On Thursday, the 11th inst., the church at Yafforth, in the rectory of Danby Wiske, was consecrated by the Bishop of Ripon. The old church, discovered from an ancient document to have been dedicated to All Saints, was curious and interesting from some antique windows and doors, and from its singular structure. A plan was formed for restoring it, but, owing to the bad condition of the walls and tower, was abandoned in favour of building an entirely new one, for which designs were furnished by Mr. Pritchett. The new church is in the Early English style, with tower, nave, chancel, porch, and vestry. The exterior is of handsome appearance, and the interior neat and commodious. It is embellished by two painted windows, by Clayton & Bell and Lavers & Barraud.

BUILDINGS.

Chester.—On Monday the ceremony of laying the corner stone of the new British School at Chester was performed by the Hon. Norman Grosvenor, M.P. for that city. The new building will be of brick, and of a character combining principally the economy of space with that of outlay, but at the same time, by the introduction of ornamental brickwork, will be a handsome structure. The architect is Mr. T. M. Lockwood, of Chester. The building will consist of two lofty floors, in the lower part of which will be accommodation for about 200 boys, and in the upper storey for about 120 girls and 70 infants. The cost of erection and land will be £1,660.

Guisborough.—Within the last few months the old Town-hall at Guisborough has been enlarged and raised by an additional story being erected, and the building is now one of the finest town-halls in the North Riding. The building as it now stands has three stories, which are appropriated to the various local authorities' offices, On the face of the gable is a coat of arms cut out of Caen stone, the arms being those of the Chaloner family. This coat of arms was taken from the ruins of Guisborough Priory, about the year 1200, and the whole is in a wonderful state of preservation, not a single line of the carving being obliterated by age. One hundred cottages for miners are now in course of erection in the town.

MARLBOROUGH.—SAVERNAKE COTTAGE HOSPITAL.—At a recent committee meeting it was unanimously resolved that the proposed new hospital be built on the hill where the present hospital is situated, but as much nearer Marlborough as the road will permit. It was also unanimously agreed that Mr. G. G. Scott, R.A., should be elected as the architect. The building will be furnished with sixteen beds, which can be easily augmented to twenty at some future time. The cost will be about £3,000, towards which the Marquis and Marchioness of Ailesbury contribute £1,300.

PRESTON.—On Monday last the first brick of the Osbaldeston Charity's Almshouses, Leyland, Preston, was laid by John Eccles, Esq., J.P., the senior trustee. The almshouses, six in number, are intended for the old women of the district, and are to be built of brick, with stone dressings, interspersed with bands of coloured bricks. Each house is one storey in height, well planned, ventilated, and lighted. The builder is Mr. Wm. Alston, and Messrs. Myres, Veevers, and Myres, of Preston, are the architects.

ROCHESTER.—The contractor for the new Corn Exchange at Rochester (Mr. Sollitt) is actively at work in forming the foundations of the building, and as the Castle-gardens come into the possession of the Corporation at Michaelmas it is probable that the double event of laying the foundation stone of the Corn Exchange and taking possession of the gardens will be celebrated by a civic banquet.

SALISBURY.—At the anniversary meeting of the Salisbury Diocesan Church Union Society, held at Salisbury last week, the following sums were voted towards building, restoring, and enlarging parsonage-houses :—Building a new house at Hinton S. Mary, Dorset, £100; rebuilding the parsonage-house at Broad Town, (which had been burnt down), £80; and enlarging the vicarage-house at Burcombe, Wilts, £20.

TAMWORTH.—Complaints have long been made of the accommodation for patients in the infirmary erected when the workhouse was built. The guardians having at length determined to erect an entirely new building on the most approved plan, instructed their surveyor, Mr. N. Joyce, of Stafford, to confer with the Poor-law Board and prepare plans for a suitable building, at a cost not to exceed £1,000. The building was arranged for twenty-eight beds. On the ground floor, in the centre of the building, are a kitchen and sleeping room for the nurse, and on the right and left-hand sides are day rooms for male and female patients respectively. Communicating with the day rooms are sleeping rooms for those patients who are too infirm to ascend the staircases. On the upper floor are three wards—one for males, one for females, and a third for special cases. The most important point to be observed in order to secure perfect ventilation has been obtained by placing the wards and day rooms so that there are windows in opposite sides of each room. The work has been completed by Mr. Joseph H. Clarson, at a cost of £998 14s.

◆

TO CORRESPONDENTS.

◆

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office not later than 5 p.m on Thursday.

RECEIVED —Veevers and Myres (thanks), J. P. S., C. C. R., W. H. D., R. A., A. L. D., A. W., J. H., C. and D., S. G., M. C., S. and Co., A. G.

S. H. G.—Shall receive consideration.

F. R. (Hailsham).—See "Intercommunication" in back vols.

Correspondence.

◆

ARCHITECTS' PUPILS.

(*To the Editor of the* BUILDING NEWS.)

SIR,—I am pleased to see the subject which I had thought had almost been unnoticed, renewed by your correspondent in your last week's issue; for it shows at least that I am not the only aggrieved member of that ill-used, though faithful class of individuals, viz., "Architects' Pupils." And I feel sure that the sentiments which I expressed in my previous letter are not simply my sentiments, but those of many of my fellow students who, though they are co-participators in all my grievances, are either content to "grin and bear them," or else have not the moral courage to publish them through your valuable medium. But I, Sir, have no opinion of adopting such a course, and I would say to all such, let them take courage from the opportunity offered them in your article of August 12th, on "Builders *versus* Architects," wherein you say that you wish your columns of correspondence and intercommunication to act as a sort of architectural *plebiscite*, by whose utterance your readers may be both guided to the adoption and encouraged to the adhesion of all that is true and wholesome. It is, then, by agitating and discussing this unwholesome subject that we hope to make it a wholesome one. Your correspondent appears to hint at "trade unionist" principles, but let us hope to effect a reformation rather by appealing to the tender consciences of all such mercenary architects than by scandalizing the profession through introducing the practices of a system which has been so detrimental to its advancement.

The case he gives is by no means a solitary one, I feel sure; and, as he says, no architect can attend properly to the advantage of their future welfare if he has four or five pupils at a time, even supposing he had a practice sufficiently large to keep them all employed. And, Sir, it is needless for me again to hint at the necessity of pupils being initiated into all the branches of the profession, or to dilate upon the misfortunes of unemployed and badly-paid assistants; these are apparent to all, and felt more particularly by the sufferers. I myself have served three years and half of my articles, I hope faithfully, and have at all times endeavoured (to quote the words of my articles as nearly as I can remember them), to obey all my master's lawful commands, which have turned out to be, for the most part, copying specifications and contracts, tracing and tinting drawings, with a smattering of details; walking over some of the buildings without scarcely ever having any of the principles of construction explained voluntarily, and, in fact, gaining no practical or theoretical knowledge but that which I obtain through repeated inquiry and observation; and yet, forsooth, I am supposed to be ripening for the profession, and am cheered with the prospect, after having served another six months, of becoming "passing rich" on perhaps £50 a-year, if I am fortunate enough to obtain a situation. I ask, then, what particular advantage has a pupil over a clerk who gives his services for a short time and begins with a small, but increasing, salary? I still hope, Sir, to see something further upon this matter, and if from no one else, I should like you to deal with it in the same satisfactory manner in which you have dealt with the correspondence on "Builders *versus* Architects," for I feel sure that the influence which your article would exert over the profession would be beneficial and lasting.—I am, &c.

AN INJURED PUPIL

PLAN-DRAWING BUILDERS.

SIR,—I do not quite comprehend the "moral," or the reasoning, at least on this point, of the article by "W. Y." in your current number. But it takes up a side of the question which I thought it needless to notice in my last letter, and on this I wish to say a few words.

No doubt there is plenty of architectural talent outside the profession; no doubt the building trade has its share of such talent, though often untaught and oftener, perhaps, taught wrong. A man who necessarily looks at every detail of a building with a view to what Thackeray called "the pursuit and capture of sixpence" is not likely to do great things either in construction or art. Still, if a man *has* any power for design in him, it matters little where he came from. If he likes to give up building and to cultivate his talent as an architect, no one, as far as I can see, wishes or thinks of hindering him. But if he wants to keep on his own profession and to trench on another as well, he can hardly ask the members of this other to help him. If the public like to support him, let them do so, by all means. But he cannot surely complain if architects cease inviting him to tender. How can he expect them to find him a standing-place while he is trying to cut the ground from under their feet? The only form in which he could honestly apply to them would be something like this :—

"Gentlemen,—I am endeavouring to do away with the necessity for your profession, and have already prepared designs for several works which would otherwise have fallen to your share. I therefore hope that you will assist me as far as possible in my business as a builder, and will let me tender for any buildings with which you may still have to do."

When this modest request is refused, fancy the applicant going away indignant and setting up for an ill-used-man!

One word more. Your correspondent has no sympathy with those who talk of bribery and foul dealing. For my own part, I think the refusal of sympathy should rather be to those who practise them. That they exist in both professions, I, for one, have too much reason to know; and *if* they exist, it is time they were talked about to some purpose. They are cosmopolitan enough, no doubt; so much the worse for us all. Keep them in the dark, and they will spread like a dry rot through society. In our own department, at any rate, let us try what light will do for them. Let every builder expose a bribeable architect, and trust to architects for exposing dishonest builders.—I am, &c. CANDIDE.

ANCIENT CROSS.

SIR,—A correspondent enquires as to the correctness of an inscription shown on a drawing of a cross in Llantwit Major Church.

I am afraid he can place but very little dependence on this sketch. I have compared it with measured drawings which I plotted on the spot last year, as also with some drawings made by a friend at the same time, and have found it to be extremely incorrect.

For instance, Mr. Allen shows the ornament to consist of a flat fillet bounded on both sides by a hollow of the same or even greater width; in reality these fillets (whose interlacements form the ornament) touch one another, having their contiguous edges slightly rounded, so that on a geometrical drawing they should be separated from each other by a single line. The section through them is, in fact, that of a number of flattened beads placed side by side, instead of a fillet and deep hollow. In the head of the cross he has recessed four spandrel pieces of ornament below the surface of the remainder; in reality the whole of the ornament is at one level. The interlacements themselves are, in very many instances, incorrectly drawn.—I am, &c. D. J. EBBETTS.

QUESTIONS.

[1918.] STRENGTH OF TIMBER.—I should feel obliged if some of your numerous readers would solve the following for me. On a floor composed of red deal joists 13in. by. 5in., with a breadth of bearing 21ft. and the joists 13in. apart, what weight would they bear per square?—X. P. Z.

[1919.] SMOKY CHIMNEY.—I have a chimney which smokes when the wind is from the S.W. A builder has taken a brick out in the S. W. face, as he says, to cause a draught. It does not prevent the smoking. Is it likely that a hole made in a chimney-flue would improve the draught?—S. R.

[1920.] PROFILE OF MOULDINGS.—Would some reader oblige me by describing the method of obtaining the profile of mouldings, such as cornices, string-courses architraves, &c.?—FRANK CHESSELL.

[1921.] LOAD ON IRON COLUMNS.—Will any one kindly inform me how to calculate the load borne by iron columns under the following conditions? In a shop front 35ft. wide the bressummer is supported at each end by brick piers, connected with the side walls; and in the length by three cast-iron columns. The wall upon the bressummer is one and a half bricks thick, and receives the ends of the floor joists. The roof principals rest upon the front and back walls, and the span is 30ft.—A STUDENT.

[1922.] ARCHITECT'S ASSISTANTS' HOLIDAYS.—I write to ask if you or any of your readers can inform me whether it is usual for a junior assistant, receiving a salary in an architect's office, to have ten or fourteen days' holiday once a year; and whether in so doing it is right for the master to withdraw the wages for the time so occupied, or rather unoccupied.—A CONSTANT READER.

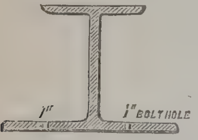
[1923.] PLASTERERS' COMPANY'S PRIZES.—I should be obliged if any correspondent of the BUILDING NEWS could enlighten me as to the results of the above competition, as I have seen no account of it.—STUDENT.

[1924.] ASPHALTING.—I should be glad if some of your readers would inform me what is the simplest and best mode of asphalting, say, for a large playground, promenade, or garden drives and walks.—GEORGE K. NORTH.

[1925.] SEWAGE IRRIGATION.—As I see in your columns continual accounts of the application of this principle, allow me to ask what is the proper number of acres of land to take for a given population? Does this depend upon the nature of the soil, or is the average independent of this consideration? This is a very important point, considering the great difficulty there is in obtaining land for the purposes of sewage irrigation.—Inquirer.

[1926.] CARRYING A STREAM OVER A RAILWAY.—What would be the best plan to adopt under the following circumstances? I have to carry a stream over the cutting of a railway, 16ft. deep. The volume of water would be fully provided for by an ordinary 3ft. culvert. The slopes of the cutting are 1½ to 1, and pillars might be put in the "six foot" between the two lines of rails. A sketch, with dimensions, would greatly oblige me.—Contractor.

[1927.] PILE DRIVING.—In driving cast-iron piles to a depth of nearly 20ft. into the bed of a river, a great number have broken about a foot from the top. Can any of your correspondents suggest a remedy? The piles were driven with an ordinary engine and monkey, the average fall being about 9ft.—Balk.



[1928.] TESTING CAST-IRON.—Having to superintend the manufacture of some cast-iron girders for a large city warehouse, I am desirous of ascertaining what would be a fair test to employ without tasking too much the strength of the material. The section of the girder is shown in the accompanying drawing, and the span is 19ft. 6in. Would it be best to test them with a small load, and carefully take the deflection, or to select one or two and load them until they broke? I am afraid that in cast-iron the deflection would be too small to notice.—Founder.

[1929.] MODELLING.—Can any of your readers inform me what is mixed with the pipe-clay for modelling to bind and make it harder when dry?—F. L. E. P.

[1930.] ANTS.—Could any person kindly tell me the most effectual way of exterminating hosts of small brown ants with which a new house is infested, and whether they are bred in the house, or find their way in from the garden?—A Subscriber.

REPLIES.

[1909.] HYDROSTATICS.—If your correspondent would inform your readers of what material the cone in question is composed the problem might be solved, but as it is it cannot, as clearly the depth to which the cone will sink will depend altogether upon the ratio of its specific gravity to that of the fluid it is immersed in.—A. C.

[1910.] LIABILITY.—It is easy to see how this case would be determined by a jury. B fails in his contract to A, insomuch as his plans cannot be executed for considerably more than £500, which he (B) knew beforehand was the maximum that A would spend. If the stables could not be built for £500 it was the duty of B to tell A so, but not to prepare plans which could not be carried out for nearly double that amount. As B engaged C to take out the quantities, he of course must pay him for his time and services, as C has nothing whatever to do with any arrangements between A and B. From the statement, one would be inclined to think that there was collusion between B and C.—Lex.

[1912.] FACTORY CHIMNEYS.—I think by "longitudinal band" "Student" must mean "circular band," as the former would signify a band extending from top to bottom of the chimney shaft. Circular bands are of great value, and should always be used. Iron cramps are the proper things to use for the overhanging stones or corbels. A very neat way of finishing a chimney is to place a cast-iron top on it, set in the best cement.—L. L. A.

◆

LEGAL INTELLIGENCE.

Libel Case at Ramsgate.—On Saturday Mr. Edward Welby Pugin, the well-known architect, was charged at the Ramsgate Police-court with writing and publishing a false and defamatory libel concerning Mr. John Barnet Hodgson, the Ramsgate Postmaster. Mr. Straight, barrister, conducted the prosecution, and Mr. Pennistoun represented the defendant. The court was densely crowded, and the proceedings were watched with great interest. The libel complained of was contained in a letter addressed by Mr. Pugin to Mr. Sankey, a member of a firm of solicitors extensively practising in the county of Kent, who had been acting on Mr. Hodgson's behalf in an action impending between him and the defendant, in which certain questions of account were involved. In this letter exceedingly strong epithets are employed. Two other letters of the defendant of a similar character were referred to. The bench sent the case for trial, and Mr. Pugin was bound over in his own recognisances to appear.

◆

LAND AND BUILDING SOCIETIES.

Equitable Permanent Land and Building Society.—The second annual meeting of the shareholders in the Equitable Permanent Land, Building, and Investment Society was held at the City Terminus Hotel on Wednesday, when the report was adopted. A dividend of 5 per cent. per annum was declared, with a bonus of 2½ per cent. being equal to 10 per cent. for the second year. It was stated that on the 1st of January a deposit bank was started in connection with the society. This has succeeded beyond the expectations of the directors, and promised to become a source of considerable profit to the shareholders.

Tunbridge Wells Permanent Mutual Benefit Building Society.—On Monday last the annual general meeting of the members was held. The annual report was submitted, and the usual bonus of 20s. on every share, which should become realized during the current year, was declared. The chairman said that owing to the loss of one of their most energetic members and largest subscribers, the balance-sheet did not present so prosperous an appearance as that of last year, but in spite of that loss, he was glad to say that the usual bonus would be paid. The report was then adopted.

WATER SUPPLY AND SANITARY MATTERS.

Barnard Castle.—The Secretary of State's order for an inquiry into the water supply of Barnard Castle, referred to in our last, will commence on Tuesday, September 6, before Mr. Robert Morgan.

Bristol.—The foul state of the river at Bristol is exciting attention, and the local *Times* urges the complete drainage of the city, by carrying out the sewage to the opening of the Bristol Channel, at whatever cost:—"We are spending hundreds of thousands on splendid new streets, or in enlarging old ones (says the *Times*); but a more spacious and commanding city, with a death-rate increasing against us, is but a whited sepulchre upon a large scale—fair without, and certainly not fair within. Before stately streets and straight thoroughfares, we should look to the sanitary condition of the city. Both economy and philanthropy call for it. Bradford and Reading obtained powers during the last session to improve their sewers and utilize their sewage; and even Dublin, the capital of a country whose people are generally supposed not to be quite so particular in these matters, is bestirring itself to carry its drainage beyond the banks of the Liffey. A large district of Bristol is inhabited by visitors and others, who, free to select their place of abode, have made this picturesque and in many respects most desirable locality their residence; if we are to keep them and attract them, we must not allow the Registrar-General's return to read against us month after month: especially when, as we believe, a great deal of the death-rate (that part of it certainly by which we exceed other places) may be removed by prompt and thorough attention to the matter of drainage."

Cheltenham.—The formal inauguration of the Sewage Farm and works at Cheltenham has taken place. The scheme was officially sanctioned, after an inquiry before Mr. Rawlinson, C.E. A tract of land, more than 140 acres in extent, at Hayden's Elm, was purchased, and to this site the main sewers from the tanks are extended for the sewage to be utilized thereon; and there is also a large district available for irrigation both between the tanks and the farm, and a little beyond the latter. At its outlet on the land the sewage is discharged at a point about 130ft. above the level of the sea. The sewer from the Chelt tank to the farm is about three miles in length, having a fall of 8ft. in a mile; that from Hatherley tank is nearly 1¾ mile long, and has a fall of 6ft. in a mile. From the land itself there is an outlet sewer for the purified water leading into the Chelt, and a direct outfall also into the Hatherley brook, which abuts immediately upon the land. The estate has been to a certain extent laid out for the reception of the sewage. Hitherto the cost of the work has been more than £6,000, exclusive of £10,400 paid for the works. The contractors were Messrs. Abell, of Worcester, and Messrs. Gibbs & Canning, of Tamworth.

Coventry.—The Corporation of Coventry lately granted to Dr. Anderson the use of the sewage works at Whitley for the purpose of testing, by experiments, his plan for the treatment of sewage. Since then a sub-committee of the Town Council has been appointed to overlook some of the operations, with the view of investigating the results said to be obtained. Experiments, extending over two days, have been conducted by Dr. Anderson in the presence of many members of the Corporation,—a tank containing 100,000 gallons of sewage being on both occasions subjected to the process of precipitation, which is the characteristic feature of Dr. Anderson's system. Sulphate of alumina—prepared by mixing two parts of clay with one part of sulphuric acid—and common lime were thrown into the tank in certain proportions, and the whole mass, having been properly mixed, was allowed to rest till the more solid parts had been deposited at the bottom of the tank. The water was then run off, and so far as appearances went it was scarcely distinguishable from pure water. Samples of the effluent water obtained by Dr. Anderson's process, and of ordinary sewage water that has not been so treated, have been sent for analysis, and the opinion of a competent authority will be taken as to the value of the solid manure, which it is proposed to sell in a dry state. Dr. Anderson believes that its value will at least cover the working expenses, and upon this, and the purity of the effluent water, the worth of the system of course depends.

Sudbury.—It is understood that the Secretary of State has accepted the tender of Mr. Thomas Tilley, of 2, Bond-court, Walbrook, for the Sudbury Waterworks.

The New Sanitary Act.—Last week the new sanitary act passed this session was printed. It contains a provision that all hospitals in the metropolis be placed within the district of every one of the nuisance authorities in the metropolis.

Wells.—The first step towards the realization of an efficient water supply for the town of Wells, Somersetshire, has been taken. Mr. Ward, C.E., has inspected the springs at Holes Ash, near Wells, and has reported most favourably on their suitability in every respect. It is intended, with the sanction of Sir C. Taylor (on whose lands the springs rise), to bring the water to the town and erect new waterworks, which will be done by a limited liability company.

◆

STATUES, MEMORIALS, ETC.

Hull.—A marble statue of Sir William de la Pole, merchant, who was the first mayor of the borough of Kingston-upon-Hull (temp. Edward III.), has been given to the Hull corporation by Mr. Alderman Robert Jameson, and placed on the grand staircase of the town-hall. It is the work of Mr. W. D. Keyworth, jun., the sculptor of the statue of Andrew Marvell, which is one of the chief ornaments of the same building. Mr. Sheriff Leatham has expressed his intention of presenting another statue to the town-hall.

Monument to Dr. Lee in Greyfriars Church, Edinburgh.—Workmen have for some days been engaged in placing in this church the sculptures by Mr. Hutchison, R.S.A., in memory of the late Rev. Dr. Lee. The monument in the church is twofold. A beautifully chiselled medallion in high relief, of the lamented divine, occupies a niche on the right hand side of the wall, going towards the pulpit, and a figure, representing the Angel of the Resurrection, has been placed on the opposite side. The medallion and the figure are both of the finest marble. The medallion rests upon a marble bracket, on which are the words "Robert Lee, D.D.;" and upon a tablet of the same material, which supports the figure of the angel, there is the inscription—"In memory of Robert Lee, D.D., minister of the Greyfriars' Church. Born November, 1804. Died 14th March, 1868."

Raith (N.B.).—A monument, in the form of a mediæval altar tomb, to the memory of the late Colonel Ferguson, has just been erected on the Castle Hill, in the Raith grounds, overlooking the picturesque lake. It is sculptured in Carrara marble, and was designed and executed by Mr. John Hutchison, R.S.A. The sides and ends of the monument are enriched with quatrefoil panels. Extending over the top and in relief is an Early English cross, with the sacred monogram I.H.S. The base and cornice are richly moulded, and the whole marble rests on a massive plinth in one block of polished red granite.

◆

STAINED GLASS.

Pittenweem.—The last of three stained glass windows has just been inserted in the south-west side of S. John's Episcopal Chapel, Pittenweem. The chapel recently underwent extensive alterations by the erection of an additional wing to the building, and by the re arrangement of the whole interior of the place. The insertion of these windows has now made the chapel the most unique of its kind in the east of Fife. The east or chancel window has three large figures, the centre figure representing the Ascension of our Saviour, with the figure of S. John and S. Andrew on each side. The south window represents the Crucifixion and Resurrection. This window is erected by surviving relatives. The south west window represents our Saviour bearing the Cross, and the Three Women at the sepulchre.

◆

Our Office Table.

The New Torquay Harbour.—This work, which has been in hand for upwards of three years past, is a massive masonry pier or breakwater, and is run out from the rocks, known as Beacon Point, for a distance of about 700ft. in a westerly direction, and is now completed. From this an elbow, about 150ft. in length, is being carried out, turning to the north-west. This pier, or breakwater, is the principal portion of the work. At the base it is about 70ft. thick, narrowing to about 56ft. at the top, the height from the foundation to the top of the parapet being 44ft. It is composed of two stout walls. Outside the pier is an embankment of stones, thrown out to a distance of something like 100ft., which gradually slopes upwards to within 12ft. of the top of the parapet. The area enclosed by the new pier is about 10 acres. The depth of water at the pier-head at high tide is 32ft., and at low tide 18ft. Along the new quay is erected a substantial and commodious range of store buildings, with the offices for the harbour-masters adjoining, the whole presenting a handsome façade towards the sea. A tramway is laid close to the edges of the pier and quay, for the use of steam cranes and trucks in loading and unloading vessels. The cost of the works is upwards of £60,000.

The Pyramids.—Col. Sir Henry James, in a recent lecture on the pyramids of Egypt, stated that in the king's chamber, inside the pyramid, some of the stones were 30ft. long. These stones, weighing some ninety tons, were not found in Egypt at all, but were brought down the Nile a distance of 500 miles, and then placed in their present position, 100ft. above the level of the ground. With regard to their finish, these Syenite stones are the very hardest known, and yet they are so exquisitely polished, and built in (to form a casing for the king's chamber) with such superior skill, that the finest sheet of tissue paper could not be inserted between two of the stones, and this after a lapse of 4,000 years. Such workmanship would excite the wonder and admiration of the world, even in this age of science and improvement.

New Graving-Dock at East Greenwich.—An addition has lately been made to the dock accommodation of the port of London by the construction of a large graving-dock by Messrs. Lewis and Stockwell, at their shipbuilding works at Blackwall Point, East Greenwich. This dock is adapted to repairing vessels of the largest class, being 400ft. long and 68ft. wide (60ft. wide at entrance), having a depth of water at average spring tides of 21ft.

Value of Land at Hampstead.—From recent sales of villa sites effected by Messrs. Edwin Fox and Bousfield on the Mount-grove Estate, we find that land which, until recently, has only been regarded as valuable for grazing and garden purposes, has realized at the rate of nearly £3,000 per acre, thus showing the enormous increase in the value of land in this locality now that it is opened up by railway communication.

The London, Chatham, and Dover Railway.—The award by the Marquis of Salisbury and Lord Cairns in the matter of the London, Chatham, and Dover Railway was issued on Saturday. In the discharge of liabilities priority is given to to the Common Fund Debentures and Stock, Victoria Station Improvement Debentures and Stock, certain Debentures on the General Undertaking, and the Western Extension Debentures and Stock : all these, with arrears of interest, are to be converted into an "Arbitration Debenture Stock," bearing interest at 4½ per cent., and of the amount of £5,000,000. Two other stocks—the "Arbitration Preference," £4,394,289, also bearing 4½ per cent. interest; and an "Arbitration Ordinary," £7,743,405, to rank after the preference—are also created, and into one or other denomination, partially or wholly, every claim on the company is to be converted.

Fatal Accident from Defective House planning.—Mr. Bedford has held an inquest at the S. Anne's Vestry, Dean-street, Soho, on the body of Mary Pond, aged 62, who died from a fall down stairs. The room in which she and her husband lived was situate in such proximity to the stairs that one stepped from the room down the first stair, there being, in fact, no landing. The deceased, who was blind, had groped her way across the room, with the intention of sitting down in an arm-chair, but, unfortunately, turned her back to the door, which was wide open, and fell backwards to the bottom of the flight of stairs, striking her head in a fearful manner, and inflicting severe injuries, from the effect of which she died. The jury strongly condemned the designer and builder of such a house, and returned a verdict of "Accidental death."

The Steam Roller.—"An Islington Surveyor" writes to the *Times* :—"Referring to a portion of a paragraph of yesterday's issue, wherein you express a hope that steam road-rolling will be adopted in the metropolis, and 'leave parochial authorities without any pretext for the continuance of a system that has long been a scandal,' you are probably not aware that for almost every day during the whole of this year one of Aveling and Porter's 13-ton steam road-rollers has been at work in this parish, and is now purchased by the Vestry."

Liverpool House-Painters' Soiree and Ball.—The house-painters of Liverpool, on Tuesday evening, celebrated the inauguration of a benevolent fund in connection with their trade society by holding a soiree, concert, and ball, in Queen Anne's Hall, Queen Anne-street. The gathering was a large one, and all who were present seemed greatly to enjoy the varied entertainments of the evening. After a very substantial tea, addresses were given by Mr. J. Cox, president of the society (who occupied the chair), and Mr. Macdonald, honorary secretary of the Manchester Alliance. The chairman stated that in Liverpool there were between 1,700 and 2,000 connected with their trade, and as not one-fourth of these were members of the society, the new association had been started for the express purpose of inducing the workmen to become active supporters of it. Mr. Macdonald referred at length to the immense advantages which had been conferred by trades' unions, and detailed the success which had attended the existence of the Alliance in Manchester. An excellent programme of music was the next feature of the entertainment, and the ball which followed was kept up with unflagging spirit until an early hour.

Street-Door Letter-Boxes.—A circular has been issued from the General Post Office calling attention to the additional postal facilities about to be afforded to the public in the shape of post cards, printed matter, newspapers, &c., and suggesting that an increased rapidity in the delivery of letters would be obtained by the general adoption of street-door letter-boxes. This plan is already extensively used in many localities, and it is hoped that those householders who have not hitherto adopted the plan will now do so in anticipation of the approaching postal changes. The expense is stated to be about 6s. 6d., including fixing the box and making the aperture in the door.

New Market for Santiago, Chili.—Messrs. Laidlaw and Son, of the Barrowfield Ironworks, Glasgow, are just finishing an immense piece of ironwork which is to be erected in Santiago, Chili, as a market-place. It is constructed chiefly of cast-iron, and forms a square of nearly 150ft on each side. Exclusive of the gates—sixty-eight in number—which were sent off some time ago, the ironwork will weigh about 1,000 tons.

Chips.

Next year's meeting of the British Medical Association will be held at Plymouth.

The directors of the Ulster Railway Company have decided to erect a new wrought-iron superstructure for the railway bridge over the river Bann, at Portadown.

Mr. J. H. Collison, Oldham, has been appointed borough surveyor for Durham, in the room of Mr. William Ground, resigned.

The Taunton Local Board of Health has instructed the surveyor to prepare a plan, specification, and estimate for the proposed widening of North Town bridge.

The chancel of the old parish church of Ilchester, Somerset, has been restored by the rector.

An exhibition of works of art and industry was opened on Wednesday week at Great Horton, near Bradford, by Lord Frederick Cavendish, M.P.

The foundation stone of a new Orange hall was laid on Saturday week in Lisburn by the Dean of Ross.

A new organ (by Foster & Andrews) has recently been erected in the parish church of Newport, Isle of Wight.

On Tuesday week the Marquis of Bute opened the Cardiff Fine Art and Industrial Exhibition.

The Queen, on Wednesday week, before leaving for the north, conferred the honour of knighthood on Mr. Edward Smirke.

A project has been started for constructing a railway from Castle Eden to Middlesborough, by which the coal owners of that part of Durham will have access to the Middlesborough docks.

The Ripon Fine Arts' Exhibition closed on Monday week, after having remained open since last Easter Monday.

The foundation stone of a new church at Holywell was laid by the Marchioness of Westminster on the 15th inst.

A new candle factory for Messrs. Brimley, Whibley and Co., at New Chesterton, Cambridge, is now in course of erection by Messrs. Howes and Clark.

Llangedwyn Church will be re-opened on Thursday, September 8, by the Lord Bishop of S. Asaph.

It is stated that the Right Hon. W. Cowper Temple is about to erect a new boys' national school at Romsey, Hants, the present building being very incommodious and dilapidated.

Thetford Church has been re-opened after restoration.

Mr. Baker, of North Hill, Colchester, has just executed a new reredos for Nayland church.

The foundation stone of a new church at the Hook, Southampton, was laid on Tuesday week by Mrs. Hornby. The edifice will be built and endowed by Mr. A. Hornby, of the Hook.

On Saturday week Colonel Hutchinson, of the Board of Trade, accompanied by Captain Hall, of the Admiralty, held a sitting at Dundee, for the purpose of taking evidence in reference to the proposal to build the Tay bridge 80ft. high instead of 100ft.

The erection of the new church of S. Augustine, South Kensington, is begun. The building will be somewhat imposing in the character of its architecture, and will be completed, it is expected, in May next. Of the whole cost, £5000 has yet to be raised.

At the last meeting of the Hedingham Highway Board, a letter was read from the Wickhambrook Highway Board suggesting that Mr. Salter, of Sudbury, should be employed, at the joint expense of the two boards, to prepare plans and specifications for a proposed new bridge over the river between Cavendish and Pentlow. The Board, after considerable discussion decided to employ their own surveyor, leaving the Wickhambrook board to employ their own architect.

Timber Trade Review.

There has not been much demand for wood during the past week, and probably consumers prefer waiting until prices are more settled. There, however, is little or no variation from last week's quotations. Freights are quoted Archangel to London, Hull, or Grimsby, 80s. ; Cronstadt to London, &c., 50s. ; Riga to London, &c., 60s. ; Quebec to London, 75s. dry deals, timber, 29s. ; Miramichi to London, &c., 72s. 6d.

It is very seldom that an opportunity is afforded of recording the prices of mahogany planks, boards, &c., when sold by auction in large quantities. The price in the log is to be had very frequently, but the mahogany trade being a separate branch of the timber trade, few large parcels of planks and boards are submitted for public competition. Such an opportunity presented itself on Tuesday last, and with the following results, which will be highly interesting to builders and other consumers.

Observe that all the prices quoted when for 1in. and upwards and for planks and flitches, are per superficial foot of 1in., all above being reduced to 1in. and sold as such. All under 1in. are quoted at a price per foot super. of the thickness given :—

Trade News

WAGES MOVEMENT.

Leigh.—The joiners of Leigh are out on strike. At an aggregate meeting of the carpenters and joiners, held on the 18th June, it was resolved to ask for an advance of 2s. per week, which would make their wages 28s. The advance was to take place on the first Saturday in August; but as the masters have unanimously declined to accede to the request, the whole of the joiners have struck work.

BATH STONE OFFICE,
Corsham, Wilts.
[Advt.]

CONTRACTS OPEN FOR BUILDING ESTIMATES.

St. Mary Abbott's, Kensington, Sept. 7.—For the erection of a new infirmary and other buildings adjoining their workhouse. Ruben Green, Clerk to the Guardians, No. 1, Devonshire-terrace, Wright's-lane, Kensington.

Croydon Local Board of Health Waterworks, Aug. 30.—For the construction and erection of a condensing pumping engine. R. J. Cheesewright, Clerk, Town Hall, Croydon.

Croydon Local Board of Health Waterworks, Aug. 30.—For the manufacture and delivery at Croydon of cast-iron socket pipes. R. J. Cheesewright, Clerk, Town Hall, Croydon.

Sheffield, Aug. 31.—For the erection of a villa residence, in Clarkhouse-road. Hill and Swann, architects, Times Buildings, Sheffield.

Rawmarsh Local Board, Aug. 29.—For the supply of the following cast-iron common socket pipes:—2,700 yards of 10in.; 1,850 yards of 6in.; 8,200 yards of 4in.; 800 yards of 3in.; 1,250 yards of 2in., together with about 5½ tons of bend and irregular pipes of various sizes in connection with the above, comprising Contract No. 1. Also for the supply of the various sluice cocks, hydrants, and other water fittings, together with special castings, comprising Contract No. 2. And for the laying and fixing of the foregoing pipes and fittings, comprising Contract No. 3. Contract No. 4—For the supply of 80 cast-iron lamp-posts, of strong pattern, 10ft. high, and weighing about 3 cwt. each. To be fitted complete with proper lamp irons and strong copper lantern, ready for glazing. F. L. Harrop, Clerk, Local Board Office, Rawmarsh.

Metropolitan Board of Works, Sept. 22.—For constructing, completing, and maintaining in repair for twelve calendar months after completion, a storm outlet sewer, penstock chamber, with two penstocks therein, flap chamber and tide flaps, and other works in connection therewith, on the premises of the Deptford Pumping Station. John Pollard, Clerk of the Board, Spring Gardens.

Oxfordshire, Aug. 29.—For building a new chapel, at Fewcot, five miles from Bicester, in the county of Oxfordshire. Rev. C. D. Marsham, Caversfield, near Bicester.

Oswestry, Sept. 24.—For a Congregational church, on the site adjoining the old chapel. W. H. Spaull, architect, Albion Chambers, Oswestry.

Tadcaster Union Workhouse, Sept. 10.—For the erection of this workhouse. J. A. Bromet, Clerk to the Guardians, Tadcaster.

St. Pancras, Sept. 5.—For providing and fixing iron railings, with iron coping and brickwork, and concrete foundation, round an inclosure in course of formation at Lismore-circus, Gospel Oak Fields. Chas. Worrell, Chief Clerk, St. Pancras Works Office, 10, Edward-street, N.W.

Keighley, Sept. 5.—Contract A.—For the masons' and bricklayers', carpenters' and joiners', painters', plasterers', slaters', and plumbers' and glaziers' work required in the erection of stable, coach-house, coachman's cottage, &c., on Skipton-road, for Thos. H. Cockcroft, M.D. Thos. Elliott, architect, Devonshire-buildings, Skipton-road, Keighley.

The Barton, &c., District Local Board, Sept. 17.—For levelling, paving, sewering, and channelling Clarendon-road, Eccles, being about 320 yards in length; also for paving and completing King-street, Eccles, about 220 yards in length. George Trenbath, Clerk, Board-room, Patricroft.

Ulster Railway Company, Sept. 7.—For the supply and erection of a new wrought-iron superstructure for the railway bridge over the river Bann at Portadown. Foster Coates, Secretary, Belfast.

Cleethorpes Sewer Authority, Lincolnshire, Sept. 6.—For the supplying and laying about five miles of socket pipe sewers, varying from 18in. to 9in. indiameter; also the necessary junctions, gullies, ventilators, tanks, and outfall works, &c. Rev. W. P. Jones Secretary, Great Grimsby.

Bedford Local Board, Aug. 29.—For the supply of about 200 tons of 15in. cast-iron socket pipes, to be delivered at one of the railway stations in Bedford. Theed. Wm. Pearse, Clerk to the Board, Bedford.

Kingston-on-Thames, Aug. 29.—For the supply of iron fencing, consisting of the following materials, viz.:—12 main posts and 60 intermediate posts of cast-iron, and about 600 lineal feet of wrought-iron rail, 1⅞in. diameter. Walter M. Wilkinson, Town Clerk, Kingston-on-Thames.

Leeds, Sept. 19.—For the whole or any portion of the works required in the erection of Holy Trinity Church, Armley Hall. Adams and Kelley, architects, 18, Park-row, Leeds.

BANKRUPTS.

(TO SURRENDER IN THE COUNTRY).

Stephen and William Dancy, Brighton, builders, Sept. 10.—John Wade, Bury St. Edmunds, brass founder, Sept. 5.—William Speakman, Salford, builder, Sept. 5.

PUBLIC EXAMINATION.—Act, 1869.

Sept. 8, G. Nelson, Sheffield, plumber.

DIVIDEND MEETINGS.

Sept. 5, W. Beck, Newbold Vendow, Leicester, bricklayer.—Sept. 5, W. Evatt, Ibstock, Leicestershire, builder.

PARTNERSHIPS DISSOLVED.

Tyley and Sons, Bristol, marble merchants.—Gritten and Son, Parliament-street, architects and surveyors.—Emery and Co., Pudding-lane, carpenters.—Kinsey and Co. Nottingham, engineers.—J. and W. Wallwork, Chorley, painters.

Price 4s., Post Free, 4s. 4d.

Laxton's Builders' Price Book,

For Architects, Engineers, Builders, Contractors, Surveyors, and all the Building Trades.

For fully fifty years this work has been considered the chief authority on matters connected with the Building Trades. Its use, even on one occasion, will probably repay the cost of the book ten times over, and instances will continually occur in which the consultation of its pages will effect a saving of many pounds.

London: MORGAN and CHASE, 38, Ludgate-hill.
And may be ordered of any bookseller in the kingdom.

PERSPECTIVES, &c, in PEN and INK or COLOURED.—See photographs from drawings in the Building News of September 10 to October 15, 1869, and many others.—M., 12, Alfred-place, Thurloe-square, South Kensington, London.

Just Published. price 1d.

A TREATISE ON THE UTILIZATION OF TOWN SEWAGE AND REFUSE FROM WORKS, Illustrated with Plans and Sections. By J. Duthie, Peel Terrace, Preston. By Book Post thirteen stamps.

The author has been awarded for his plan the Silver Medal of the Royal North Lancashire Agricultural Society, 1867 and 1870.

THE NEW ELEMENTS OF HAND-RAILING, in concise Problems, calculated to bring this most useful science within the reach of every capacity. By Robert Riddell. Illustrated with accurate plates, 4to., cloth, pp. 126 and 40 plates, 21s. Trübner's "New Scientific Catalogue," post free, 2d.

London: TRUBNER & CO., Paternoster-row.

ARCHITECTURAL PHOTOGRAPHS & BOOKS.

A Set of 8 PHOTOGRAPHS (mounted in cardboard), from the original drawings of the PRIZE DESIGN of the MANCHESTER TOWN HALL competition. Size of the photograph 12 by 10. Price £2 2s

A LITHOGRAPH of the HOTEL DE VILLE AT HAMBURGH (the prize design), by G. G. SCOTT, Esq., Architect. £1 1s.

A PHOTOGRAPH (mounted on cardboard) of the ASSIZE COURTS AT MANCHESTER by A. WATERHOUSE, Esq. Architect. Size of the photograph 26 by 21. £1 1s.

The above, being very suggestive designs, would be useful to all first-clas offices.

EXECUTED EXAMPLES OF CHURCHES, CHAPELS, MANSIONS, and VILLAS, to be completed in Five Divisions, at 10s. 6d. each. The first and second divisions only just out.

These examples are by different architects, and they contain the actual cost of each building, and the materials used, together with the ground and chamber plans.

CHURCHES and CHAPELS erected by G BIDLAKE, Esq., Architect, Wolverhampton, with the plans and the actual cost of each erection, together with the best arrangements of the seats, both in the gallery and the ground floor. 12s. 6d.

This little book is quite a favourite with the profession on account of the well-known ability of the architect in designing and carrying out the different Nonconformist Chapels and Schools Houses, &c., in different parts of England.

The above Photographs and Books can be had from the Publisher, S. BIRBECK, Bookseller, 10, Church-street, Lozells-road, Birmingham.

HANDBOOKS FOR TOURISTS.

AN INTRODUCTION to the STUDY of GOTHIC ARCHITECTURE. By J. H. Parker, M.A., F.S.A. Third Edition, Revised and Enlarged, with 180 Illustrations and a Glossarial Index. Fcap. 8vo., cloth extra, 5s.

A CONCISE GLOSSARY of TERMS used in GRECIAN, ROMAN, ITALIAN, and GOTHIC ARCHITECTURE. By J. H. Parker, M.A., F.S.A. New Edition, revised. Fcap. 8vo., with nearly 500 illustrations, ornamental cloth, 7s. 6d.

"For the knapsack of the traveller, or the table of the amateur, not sufficiently interested to need the completer work, it is an invaluable little volume."—Builder.

THE ENGLISH ARCHÆOLOGIST'S HANDBOOK. By Henry Godwin, F.S.A. Post 8vo., cloth, 7s. 6d.

"The antiquary will find it inestimable as a book of reference; the student will have in it a valuable assistant; and by a judicious use of it, the sham antiquary may avoid any great mistakes when his cousin the vicar displays to him the wonders of his parish church. . . . . We imagine that no archæologist will henceforth consider his knapsack packed until this little handbook is put in."—Athenæum.

Oxford, and 377, Strand, London: JAMES PARKER and Co.

IMPROVED DWELLINGS FOR THE PEOPLE.

THE ARTIZANS', LABOURERS', AND GENERAL DWELLINGS' COMPANY
(Limited).

Capital £250,000. Shares £10. £1 paid per Share.
President—The Dean of WESTMINSTER.

Arbitrators.	Local Council.
Right Hon. Earl Shaftesbury.	Thos. Bazley, Esq., M.P.
Right Hon. Earl Lichfield.	Jacob Bright, Esq., M.P.
Lord Elcho, M.P.	John Cheetham, Esq., M.P.
&c., &c., &c.	W. R. Callender, Jun., Esq., M.P.

W. Swindlehurst, Manager and Secretary.

The Company is especially formed to erect improved workmen's dwellings on the co-operative principle. No beershop or tavern to be erected on the Company's property. Profits realized by workmen employed on the buildings 40 per cent. Deposits received at 5 per cent. Prospectuses on application, enclosing postage stamp. Office, 1, Great College-street (opposite the House of Lords), Westminster, London.

THE BUILDING NEWS.

LONDON, FRIDAY, SEPTEMBER 2, 1870.

IRON.

FEARFULLY, all over Europe, the question of iron and steel in the market is just now prevalent: not for purposes of peace or uses of domestic industry, but for the destruction of mankind. We have heard of the flint, and the bronze, and the iron ages; but no age was ever more iron, or rather, more gun-metal, than this. The science which was destined to make us better has made us worse; and we are fighting with the very elements that were intended to confer mercy, not less than strength, upon civilization. Still, taking facts as they are, we must admit the enormous part which war plays in the drama of the day, whether for humane or for cruel objects. Half the science of Europe appears now to be turned towards metallurgy. Since Agricola wrote his "De Re Metallica," there never has been so much attention devoted to the subject. We were always, as a nation, making experiments about it. We began with wire-works; we went on to needles; we sold swords in Toledo and daggers in Milan; and thus we carried on an eccentric commerce until the value of great guns was known. Twenty millions of tons of English manufacture, in iron and steel, were exported from Great Britain in the year 1864. These details tell, of course, upon the enterprise of such parts of the country as Wales, and the South Staffordshire, Yorkshire, Durham, and the Scottish mining districts. And the demand for this product is incessantly increasing. It accompanies every improvement in tools; ship-building cannot be advanced without it; watchmaking can make no progress without it; it is the material of the mariner's compass, of the fashionable crinoline, of the surgeon's lancet: and now, in these terrible days of war, it is the arm and defence of nations. We are all heating and hammering this metal until it almost seems that our country had become a region of reverberatory furnaces. Since the discovery of the black-band ironstone in Scotland, and the invention of the hot blast, we have, indeed, grown to be less dependent upon foreign sources; but every practical man is aware how we have, at times, relied upon Dutch cast-iron and upon the crude fabrics of Sieven, in Germany. Those transactions are affairs of the past, no doubt. The new Clyde Iron Works have superseded their traditions. We have found immense riches underlying the Scottish midland counties, and there can be no limit to the ingenuity of our manufacturers. Nevertheless, a serious doubt exists as to whether, in this matter, we are holding our ground, and not buying from Belgium what we cannot appropriate for our own service, should the necessity be evoked. It seems untimely, however, to put such a question. Industry and War lie far apart, happily, one from another. We may exist in an age of iron, yet we may not, perforce, desire that iron shall be turned to relentless purposes. It was long thought to be our servant; we have converted it, however—or, at any rate, our neighbours have—into cannon and the mastery of Europe; it is a commentary upon civilization, but a commentary still; and yet to this moment, while we, and the French, and the Germans forge their huge ordnance, Indian artificers tell us, as they have told us for centuries, that our cutlers, so far as science and art in the iron and steel fabric are concerned, must remain in despair. Well, we would ask our mechanics whether it be true or not that this manufacture has deteriorated? We put no faith in the stories about the Sheffield artisans burying their raw material for several weeks in water, or of the razors sharpened from the iron-shod piles of old London Bridge; but nothing can be more certain than that, in our race after perfection, we are trying, in some confusion, a number of experiments; adding carbon to malleable iron, partially decarbonizing cast-iron, and adding malleable to cast, in order to produce steel. The celebrated Catalan process, "in which the ore is reduced by a charcoal fire, and the resulting metallic is afterwards carbonised on the hearth by contact with an incandescent charcoal," has been tried, and not with success. The results are not uniform. They are partly iron and partly steel. The work produced is deformed and weakened by blisters; the excess of carbon in the admixture is not safely got rid of; the refining is imperfect; and the regulating of temperature in the casting can scarcely be commanded. This, according to many opinions, accounts for the waste of so much German artillery during the war now unhappily raging. Half the patents of recent times, registered with a view to obviating these difficulties, have been discarded. German artillerists will tell you that the "purified fluid metal," free from silicon, phosphorus, and sulphur, and puddled to perfection, would be a triumph. It was not. The result was "burnt iron." Still the invention triumphed over all previous processes, and was a step in the right way, but very exhausting to the apparatus employed in the manufacture, and very wasteful to the metal itself. We have learned a great deal in the science of steel-making since Mr. Bessemer resolved to persevere. We have gained in lightness and strength; in cheapness; in the facility of constructing large-spanned girder bridges; in the plating of ships; in building commercial and passenger steam-boats; in the laying down of rails; and in the generally tensile strength of iron employed in engines and machinery. No doubt various causes for these improvements may be assigned. We have overcome a good many perils of a practical character, arising from sheer ignorance of the nature and capacities of iron. We have begun, at length, to distinguish between the qualities of our various ores; but, after all, are we thinking at present of iron trophies built for peace? Unhappily, not. We are dwelling upon the iron industry of the Messrs. Krupp, in Germany; we are turning our thoughts to the ease with which steel may be turned to the destruction of mankind. And in what contempt are the ancient inventions held! Captain Jerningham, before the Select Committee of the House of Commons, only a little while ago, declared that our "adamantine lips" were worth, in a battle, not more than so much crockery. A fresh element entered into the manufacture; cannon-foundries became laboratories; military engineers were bidden to remember the disturbance of crystalline forces; they were told to weld their guns to absolute soundness in every part; they were prohibited, for the future, from hiding flaws by ingenious strokes of the hammer; in fact, they learned that a new age of iron had commenced, and would necessitate certain new qualifications in the adaptation of it. So France, so Prussia, so Spain, so the United States, and in her turn, England, was persuaded with the idea, and the science of iron occupies a forward position in the intellectual view of modern Europe, fortunately not altogether in its adaptation as a means of warfare. The Messrs. Krupp calculate that their works, formidable as are the monsters turned forth, represent not one tithe of the metal employed for peaceful purposes. They, Germans though they are, and interested in the most terrible conflict of modern times, hate war, as those who practically know about war must always hate it most, although they supply its apparatus. They deplore it as the worst crime which can be perpetrated by humanity; they pity the people and the governments that purchase in their direful markets. Nevertheless, they urge, and with truth, iron is the grand material of the day. It has not only superseded wood in many instances as the substance of beams and roofs; it makes the train, it builds the bridge, it has risen to a prodigious importance from the days of Basan to those of Birmingham—in plain truth, with powder, it is the power of war. And a power of peace also. It supplies the machinery of our travel, of our domestic convenience, of our trade, and, from an old horseshoe to a broken kettle, every scrap of it has a price. Now, all this is thoroughly well known, and it is perfectly well known also that England possesses, in unfailing abundance and variety, the treasure of a natural iron store. Unless she wilfully throws away her advantages, her superiority in this respect can never be imperilled. Our materials are excellent, our machinery is unsurpassed, our mining population is industrious, bold, and hardy; we are in charge of a manufacture national in the best sense of the term, and yet foreigners are boasting that they can outvie us. We are far from believing it. Nevertheless, a prophecy or a vaunt is often the presage of a fact. The greater truth, however, should overcloud the more distant possibility. The superiority of this metal over all others, writes a wise mechanician, consists in the vast number of purposes to which it can be advantageously applied, and the various modifications of which it is susceptible in the process of manufacture. There is, indeed, no other metal which could be worked up as well to serve equally for a needle and for a shot for a 98-pounder gun; as a surgeon's lancet, and as a 10-ton Nasmyth hammer; as the spring of a watch the size of a shilling, and the hull of a leviathan steamship; and which is alike indispensable in the construction of a pair of scissors and an electric telegraph, a steel pen and a railroad, a mariner's compass and a tubular bridge. The iron machines of our manufactures are driven by the steam engines of Watt, and their products are distributed over iron railroads by the iron locomotives of Stephenson. We have iron roofs, iron churches, iron houses, iron lighthouses, iron palaces, iron hotels. Such is the British boast; the German prediction is, that, the war vanishing, Germany will take a great share of this industry from our hands. We have no fear; their rivalry will encourage our skill. Only let us always be sure that confidence in our own skill does not tempt us to forget the emulation of our neighbours.

◆

ANOTHER FAILURE OF COMPETITIVE EXAMINATIONS.

IT is no secret that two successive attempts to obtain "the coming man," in the person of a competent surveyor to act for Government, under Captain Galton, have signally failed. This fact, in itself, is less strange than that expectations of any other result should have been entertained. That men of experience and ability fit for such a position and its responsibilities should subject themselves to the character of examination proposed, and submit to tests as to their being able to speak and write English grammatically, as well as to their special professional knowledge and skill, is not credible for an instant, and consequently none but a few architects' assistants were found to offer their cheeks to the smiter. Some such, of course, would be found eager to secure a higher salary and social standing than they have been able to attain in the somewhat arduous course of life which they have chosen, and in which they have had keenly to compete with their brethren for the few openings it presents. These, however, are men who have, to a certain extent, if not failed, yet not succeeded, in the battle of life, in a path which, though not very remunerative, yet, like most others, has prizes amply sufficient for the comparatively limited number of able and energetic men who enter the lists to strive for them. The Department must, therefore, abandon this method of selection if they would secure the services of a competent surveyor to undertake the responsible posts they are endeavouring to create. We dismiss the question as to the wisdom of such a desire on their part. That is to be argued upon the broad principle of centralization or non-centralization, and may safely be left to experience to decide. Government has apparently resolved upon trying the experiment, and the public may fairly expect to be the ultimate gainers thereby, even though the experience they seek has to be gleaned from failures. The jealousy of some members of the architectural profession has been aroused by what they consider to be an attempt to supersede themselves. But it hardly needed the disavowal on the part of Government (which has, however, been given) that any such intention existed to relieve them from anxiety on that score; for even if the present Government does seek to dispense with employing architects, their doing so may be looked upon as a mere temporary and frivolous, though inconvenient and disagreeable freak. The sure, though we must own slow, progress in the refinement and intelligence of the nation will not long suffer public buildings to be erected by other than the most able hands, and therefore the salaried surveyors are not likely to be called upon to execute work for which in the nature of things they cannot be fitted. What is required by the present Government is no more than what we believe will always be a practical want of the nation,—persons whose special business it will be to look after the condition of public buildings, either those erected or in course of erection; clerks of works, in fact, who will have to advise as to the necessity of employing an architect in the former case, and to act under the orders of one in the latter. There is no doubt some danger of a wish on their part to step beyond their proper province, and also that they might occasionally be called upon to do so in an unwise spirit of economy on the part of their employers. Yet, as we have already pointed out, we think such aberrations from the right course will soon be detected and avoided. Why, then, has the system of competitive examination failed in this case as well as in that we referred to in the last number of our journal? And how should future failures be avoided if the Government would obtain the surveyors they have asked for? These two pertinent questions we propose to deal with upon the present occasion.

Competitive examinations appear to us admirably suited on the whole to winnow out the best material from the class of students fresh from their studies at school or college, though here, as is well known, they occasionally fail, and the well-crammed mediocrities often are placed by them higher than far more able and practical men who have been less well-drilled or less diligent. Time, however, is pretty sure to reverse these conditions, and this evil is cast into the shade by the evident good effects of the system at this stage in the life of men. When, however, the same system is sought to be carried out in the choice of men of maturer age, to select candidates for positions needing men of ability and experience. it seems as if it must necessarily fail, as it will certainly not be the foremost who will come forward to compete for them, particularly if any rigid examinations have to be gone through for the purpose. It is notorious that men of middle age, who have long since left off the study for the actual practice of their professions, would not be able to compete against younger men in points of mere book-learning; but is it the latter in preference to the former that the Government need for their work? 'Prentice hands had far better be allowed to experiment in *corpore vili* than upon important buildings at the expense of the public. Now we happen to know thoroughly capable and well trained men who would gladly accept the post and terms offered by Government for their assistant surveyors, who have declined to put themselves forward on the very grounds stated above, and we also know for certain that out of the two batches of candidates who did present themselves not one equally competent man was to be found.

In answer to the second question—how should future failures be avoided if the Government would obtain the surveyor they have asked for?—we would point to the system that has been judiciously adopted by the Metropolitan Board of Works with regard to the district surveyors appointed by them. This system has now been so long and so successfully carried out that Government could not do better than follow it. The examination for fit and proper persons has been delegated to the Royal Institute of Architects, and is held by them several times in the course of each year. Candidates come up at the age and period in the course of their career to which we have pointed out that such competition examinations are suitable, and they then receive a certificate of competency, which they can produce at any future occasion, when an appointment is vacant. A man who has once proved himself a proficient in professional theory and practice cannot do otherwise than improve by experience as time rolls on, and may safely be considered to have done so without being again subjected to a test which in his case would amount to an indignity.

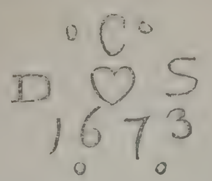
But it might be asked, how is such a system to be set on foot so as to enable Government now to select such men as they want? In our opinion the best way would be to offer their first appointments to the men who now hold the certificate of the Board of Examiners of the Institute, for the duties demanded of them cannot differ widely from those required from the district surveyors of the Metropolitan Board of Works. The Government would, doubtless, reply that they sought the advice of the Institute on the subject, and were repulsed by that body, such having been to a certain extent the fact.

All, however, that they did do was to ask the Institute to make known that certain appointments were to be offered to candidates who would subject themselves to the examinations we have deprecated. When we say deprecated, we mean, however, only for the reasons above given; the examinations themselves were, we know, thoroughly well organised and conducted, the only fault was that they tended to keep away the right class of candidates, and that the actual candidates broke down completely under them. Had the Institute been asked to advise as to the method to be pursued, we doubt not that they would have given such advice as we have endeavoured to sketch out, and we believe that such, or a similar course, is the only one that is likely to prove successful.

SUNDRY BUILDINGS IN THE ISLE OF THANET.

MANY architects and architectural students, as well as the public generally, will, in consequence of the grievous war now being waged upon the Continent, have their attention not unprofitably directed homewards, and may find, without having far to seek it, much food for reflection. Along the line of the London, Chatham, and Dover Railway—from Rochester, with its stately memorial of the Roman invasion and its mediæval cathedral, to the modern and somewhat plebeian watering-places of Margate and Ramsgate—almost at every station may be seen a really stately church or other architectural work, and here and there between them humbler, but hardly less precious, relics of old and good domestic work. As we have felt ourselves unable to resist the temptation of exploring several of the bills of fare thus held out to us, we propose not selfishly to keep the feast all to ourselves, but to give our readers such a taste of them as we hope may induce them to follow our example. Having made little aristocratic Broadstairs, as it is called, our head-quarters, in preference to its larger and more popular neighbouring towns, we shall commence our gleanings in its vicinity. Although the ill-regulated enterprise of speculative builders bids fair to rob it soon of some of its special charms, the walk down its High-street and round its picturesque little bay has not yet been greatly injured, and retains much of the effects of an ancient Kentish village. The architect, indeed, cannot but grieve over the paucity of the remains of its once thoroughly picturesque and admirable domestic architecture, and will have to wend his way to the neighbouring village of Reading Street if he would see several of the old flint and brick gabled cottages together. Still even in Broadstairs, are several excellent examples of the kind to be found, modestly retiring from the general street line, and shrouded by the shrubs in the little gardens in front of them. What church, if any, other than S. Peter's, which is about a mile off, the town originally possessed, has unfortunately been superseded by a hideous modern one, the very memory of which causes a shudder, and a faint hope that a friendly storm might put an end to its melancholy existence. A parsonage is rising close to it, which, being from the designs of Mr. Tarver, the architect, will add no little to the embellishment of the town, its position being picturesque, and its grouping and outline promising to be so. We could have wished that the local and suitable type of work which we are referring to had been selected instead of the somewhat commonplace work that has been adopted; for we doubt that much, if any, additional cost, would have been the result; still we are altogether grateful for the example given to the local builders as it is. Some ruins of a small chapel, dedicated to our Lady of Broadstairs, still exist near the picturesque timber-built pier, which is said to date from the time of Henry VIII., but probably has had every part of the structure renewed, like the well-preserved carriage, which sometimes had new wheels put to its old body, and at others a new body to its old wheels. A veritable piece of antiquity, however, is an archway of an old portal under which one passes to get to the pier, and it tells of less quiet days than our own, when defensive walls were needed to ward off privateers; at which time the chapel before referred to, and an image of the Virgin kept within it, were held in such veneration that ships passing it used to lower their top-sails to salute it. About half a mile from Broadstairs, upon a fine site near the Foreland, belonging to the Archbishop of Canterbury, and at the back of his residence, Mr. Seddon, the architect, is now building for Mrs. Tait a large orphanage to contain sixty orphans and ten ladies, which will be a conspicuous feature from the town and whole surrounding neighbourhood, as, from the height of the ground, it will be visible from both Margate and Ramsgate. Its plan is the shape of the letter **I**, with the entrance in one wing and the chapel in the other. It is built with the local materials of flint and brickwork, with dressings of Doulting stone. Being upon a promontory it will command extensive sea views almost on all sides, and would certainly appear a most healthy and pleasant residence for the inmates in fine weather, but they will get the full benefit, such as it may be, of all storms, to resist which it is being built in a most substantial manner with thick and hollow walls. We will now enumerate the remains of the old domestic work within the town itself, of which we hope to be able to give some illustrations hereafter.

The best example undoubtedly is a block of two houses, called Milton-place, at the bottom of the High-street, bearing on a table of brickwork the inscription



It is two stories high, divided by a string-course of three courses of brick, and the upper story is divided into five spaces by pilasters of one brick in width, and there is a frieze under the eaves which has a piquant effect, and which is composed simply of a row of two headers placed diagonally, the spandrels and wall surface generally being of split flint-work. The doorways, unfortunately, are of more recent insertion, and only fragments of the original windows remain, modern sashes having replaced them throughout, except it may be that the panel now bearing the name Milton-place having been originally one of them. The gables are of good outline and proportion, and a stack of chimneys at one end is well treated, but as a drawing will give a far better idea of them than any description, we shall request our readers to wait until we can give them one, as we hope soon to be able to do. The bricks used are somewhat over 9in. long by 2½in. thick, with wide mortar joints, and much of the delicacy of the effect is due to this, and would be lost with the thicker bricks now generally used.

A little higher up the street, on the same side, is a gable end with plain straight verges. The face of the gable is richly diapered with brickwork and flints, and has the original small windows in it, and a string-course at the springing three bricks high, but with flints in a row in place of the central course of bricks. There is a very good gable and chimney; the latter, however, mutilated. A little higher up a sort of flat segmental pediment crosses the chimney stack, the bricks of which are moulded.

In several other cottages about the heads of the doorways seem alone preserved, and are useful as supplying the missing links in the otherwise more perfect examples we have described. It is necessary to study with care several specimens to be able to restore any to their original condition.

There are some other but less valuable fragments in Albion-street and other parts of the town, but they are all so far surpassed by those in S. Peter's and Reading Street and elsewhere that we need not extend our researches at Broadstairs further. Nor with respect to such ancient domestic work will it be of much use to mention the few which modern progress has allowed to exist at Margate. Still there are a few in the older part of the town, and one block of timber-built cottages, with little projecting bay windows, struck us particularly in a recent walk through that town, and certainly caused us to retrace our steps for the purpose of sketching and measuring it.

◆

THEORY OF THE ARTS.

(*Continued from page* 131.)

THE REVIVAL; MODERN ART; ANALYSIS.

FROM the commencement of the fifteenth century art gradually underwent a change of a very marked character. The æsthetic action, as I have said, was somewhat impeded by the other more provisional movements of the age, especially the industrial and scientific, which began simultaneously to effect a revolution in the thought and feeling of the period. Hence we find æsthetic genius wanting in that social direction and expression which it had before possessed. It must be again remembered the æsthetic faculties are intermediate between the moral and intellectual; and the fine arts, having to express these attributes of society, adapt themselves especially to a homogeneous state of society. Fetichism and polytheism, as we have seen, were both favourable, and so was that transitional stage of monotheism which we have just sketched. But the harmonious balance of thought and feeling was soon disturbed. The scholastic system had accomplished its mission; a new order of things commenced under the guidance of reason and actual observation, under which the prolonged compromise between religious and secular thought was impossible.

Again, it was impossible for the æsthetic movement to keep pace with the industrial or scientific movements, and rapid strides were being made by the former of these.

A glance at European society is sufficient.* It was disturbed politically, intellectually, and morally at this epoch. The feudal character was gradually yielding everywhere. Nationalities were springing up in France, Germany, Italy, and other countries; there was a progressive centralisation going on, an organisation of forces, but an apparent confusion prevailed. Ancient elements and forms begin to disappear and regular forms of government take their place. The old feudal system failed; security and progress are looked for. Ecclesiastical power everywhere yields to the secular temporal power. The rise of the Classical school of *literati* and free-thinkers throughout Europe created perhaps the most profound revolution as regards art. Dante, Petrarch, and Boccaccio were really the pioneers of restored Greek taste in art as in literature. "The golden morning" of Italian literature and art had hardly dawned upon England, however, till about a century later. During the latter part of the Plantagenet epoch, the development of the English Constitution and Parliament, commercial enterprise, and industry, gave little leisure for the cultivation of the taste or the elaboration of a new style of art. Even under the sway of the Plantagenets manufactures made progress. Thus woollen manufactures, an extensive source of commerce, had an impetus as early as the fourteenth century, and Edward III., "the father of English commerce," encouraged Flanders in that commodity and invited Flemish weavers into England. Commerce, indeed, after liberty, became the leading feature, and the object of Parliament. During the same reign we find statutes framed for the protection of artisans and others. Again, maritime enterprise and discovery tended much to foster foreign views and taste under the Tudor dynasty; while the invention of printing, and the growth of a rich literature, adorned by a host of names, from Chaucer to Spenser, Shakespeare, and Bacon, aided to disturb national æsthetic action and to promote foreign ideas and art; for it must be remembered that during the Elizabethan epoch an affected style, in which Classical quotation and idiom were prevalent, became fashionable, and certainly hindered the development of a national style. The coarse manners and barbarous ideas of the Middle Ages were everywhere discountenanced by men of education; but, on the whole, pedantry and unreality were substituted for indigenous feeling. The progress of completion of the Reformation during the latter dynasty was itself a powerful means of retarding national art by the reactionary measures of reformers, and this combined to forward the secularisation of art more than anything else. On the whole, the progress of material improvements and scientific discovery was entirely out of all pace with the moral and æsthetic condition whose basis was thus revolutionised, and whose action was impeded, if not destroyed.

Out of such a chaos, the forms and elements of ancient art formed the basis of a new art system, in which selection and adaptation became the chief principle of development. It is hardly necessary to say indiscriminate *selection*, or the reproduction of features without the function of the second process, became the characteristic object. Functional or organical development, if I may so term it, no longer existed in art. There was not even a scientific method of appropriating the forms of ancient art, though Vignola, Palladio, and other Italian artists, adopted the academic canons laid down by Vitruvius centuries before, which were little better than set rules for composing mechanically the *ordonnances* of Greek and Roman Temples.

But the leading feature of this epoch was the separation between the religious and secular powers. All the other movements of the age contributed to this result. The developed state of domestic architecture during the Elizabethan epoch in this country alone, and the comparative neglect into which ecclesiastical art fell, is sufficiently indicative of the change. Again, the improvements in the material comforts and mechanical arts, such as the introduction of chimneys and window glass, gave an impulse to secular architecture. Æsthetic progress was also checked, and bore no proportion to that of the material and mechanical arts.

Thus the course of ancient art was diverted, or rather stopped. It is enough here that we briefly analyse the character of the revival. Its history, and the great names of the revivalists, every student of art history is well acquainted with. The sixteenth century may be regarded as the crisis in art history. It was the turning point from art conception to art reproduction. It was not a return to the spirit but to the mere letter of Classic art. The earlier phase of the fifteenth century, marked by the early Italian and Continental revivalists, shows an attempt to amalgamate the peculiarities of Classic and Gothic art—an infusion of Classical feeling into Gothic detail is rather the distinguishing element than an indiscriminate re-employment of Classic features. Mr. Fergusson, in his handbook of "Modern Architecture," distinguishes clearly the earlier phase, or Renaissance, from the later phase of the Italian revival, as practised in England during the seventeenth and eighteenth centuries by Inigo Jones, Wren, and their followers. The first period was marked chiefly by the works of the Mediæval-Italian artists, which show a return to Classic simplicity without the slavish introduction of Classic details. Such were the works of Brunelleschi, Michelozzo, L. B. Alberti, Sansovino, &c. The second phase is more prominently illustrated in England.

Our own late Gothic was much predisposed for the engrafting of Italian details; thus the arch was subordinate to the horizontal members, which became as strongly marked as the vertical features, and assumed the profile of Classic mouldings. The high-pitched Gothic roof was substituted by a very flat pitch in the post-Gothic period, and various other indications show a tendency of the Tudor Pointed to merge into a semi-classic style, as the late Elizabethan. In France, and elsewhere on the Continent, the renaissant tendency, assimilated itself more readily to the Gothic, and produced a more homogeneous style, while in those countries which were most Italian in feeling the change was earlier, and the mixture of elements still more homogeneous. Ecclesiastical Gothic architecture terminated in England with Henry VII.'s reign, and his own chapel bears evidences of the renaissance of Classical features and principles.

Throughout the Renaissance period, the process of art-design was reversed. Under the Gothic, and in all preceding systems of art, principles of general structural design preceded or formed the basis of the details. Not so under the Renaissance. The general principles of late Gothic were retained, but the details were borrowed. Classic forms, and least essential details, were first introduced, and ascended into the more structural and larger features. This process gradually went on till the whole system of the revival became a complete sham or disguise under the Anglo or pseudo-Greek age of the last century. Of the styles of Italian—of which there are three schools, the Florentine, Roman, and Venetian—the first and last seem to possess the greatest pliancy for palatial and domestic buildings. The Florentine has a Grecian refinement and sublimity of breadth highly expressive of civil or domestic purposes; and the development it has attained in this country by the late Sir C. Barry show it to be well adapted for secular wants and civic purposes. Being astylar, and of a fenestral character, it possesses an adaptability for such requirements not found in the other styles. The Roman and Venetian schools have each distinctive features, though both differ from the Florentine in being columnar. The English school chiefly belongs to these. In the Roman school there is perhaps more variety in forms than the Florentine, but the majestic size of the order renders it less pliant than the more astylar treatment of the other schools. To the Venetian school belong the larger share of the English examples which were founded upon it. Inigo Jones, Wren, and Vanbrugh were the leaders of this school in England. One peculiar advantage in the Venetian manner is the greater variety admissible in plan and grouping, which renders it more suitable for country buildings and for general requirements. It has a poetic complexity and outline, as displayed by Vanbrugh, eminently favourable to scenic and landscape effect. G. H. G.

TESTS AND QUALITIES OF BUILDING STONE.

THE following extract from the report of Mr. James Hall to the New York Capitol Commission—contains much that is of interest and value :—

In the selection of building stones for the exterior walls of a building, *colour*, *texture* and *durability* are objects of the first importance; and all of these ought to be combined to render the structure perfect. Too little attention has been given to the subject of building stone; and while, on the other hand, we are largely using a brown stone which gives a sombre, cheerless aspect to the structure, the opposite extreme has been sought in the white marble, or that which is more nearly white in colour. In contrast with these we have the red glaring colour of brick; and it is only partially that this offensive aspect is palliated by painting in neutral tints. In a few eastern cities and towns we find the light grey granites now used in preference to the brown freestone, the white marble, or the dark granite, which have been much in use in past years.

No one can fail to experience the sensation of relief afforded by the structures of light-coloured granites in the city of Boston, or those of the buff or dove-coloured limestone in the city of Chicago, or of the light grey freestone of many buildings in Cleveland and other places, and of the buff-coloured brick of Milwaukee. In these cases we have not the excessive reflection of light, or the glare which comes from white buildings, whether of marble or of painted brick; nor the sombre, cheerless expression of the darker stone, caused by its great absorption of light. It is only necessary to consider the effects produced by the structures of these different materials upon one's own sensations in order to determine what are the most agreeable tints, or those which please the eye and produce a cheerful impression upon the mind.

In the majority of structures, the necessities of locality, cheapness, or other causes compel the erection of structures from materials most accessible; but these considerations are not imperative in the case of an important public building.

In many cases, where the rock is homogeneous throughout and the colour uniform and satisfactory, it is only to be inquired whether the colouring material is such as will produce decay or disintegration of the particles. When the general colour is produced by the aggregation of different materials of distinct colouration, the character of each one is to be considered, and its effect upon the whole; and it is important to have such material comparatively fine-grained, and the different parts as uniformly mingled together as possible. As a general rule, it is only in the darker stones that the colouring matter has any tendency to disintegrate the mass.

In the selection of building stones, the simple presentation of a sample is not enough. The rock in place should be examined in the outset; for in its natural out-crops it has been exposed to the action of the weather, in all its influences, for many thousands of years. One of the principles taught in elementary geology is that the soft and decomposing rocks appear in low rounded or flattened exposures, or entirely covered by the soil of their own *debris*, forming no conspicuous feature in the country; while, on the contrary, the harder rocks stand out in relief, producing marked and distinguishing features in the landscape. It not unfrequently happens that the geologist, having familiarized himself with the succession and character of the rocks of a particular locality or neighbourhood, by seizing the features and character of the prominent beds, is able to trace them in succession along the escarpment or mountain range as far as the eye can reach, and to approach them from any distant point with assurance that he has not been deceived.

The strata which make these features in the landscape are the ever-enduring rocks, which have withstood the action of the atmosphere through a period a thousand times longer than any structure of human origin. One cannot doubt that, if properly placed in any artificial structure, they would still withstand the action of the elements. These escarpments, in their natural situation, may be coarse, rough, and forbidding, more or less dilapidated, or unequally dilapidated from the effects of time; but as they there present themselves, we shall be able to see their future in any structure exposed to the same influences.

It is true, however, that no artificial structure or position will ever subject the stone to the same degree of weathering influence to which it is exposed in its natural position, but the same changes in degree will supervene upon any freshly-exposed surfaces. In its natural position the bed has been encased in ice, washed by currents, saturated with rains and melting snows, frozen and thawed, and exposed to the extreme of summer heat without mitigation. The rock which has withstood these influences is quite equal to withstand the exposures of a few centuries in an artificial structure. Yet there are occasionally modifying influences and conditions which have sometimes subdued the permanence of a durable stone, and given preference to others less durable. It therefore becomes necessary to carefully examine all these conditions, and to determine, not only from the rock in place, but also from its physical constitution, whether it will meet the requirements of the structures proposed.

It not unfrequently happens, in working a quarry, that layers are reached which have not been exposed to the weather, and it is then necessary to test the strength and power of endurance of the stone. This may be done by repeated exposure to freezing and thawing, by testing the strength or power of resistance to pressure, &c. The exposure to freezing and thawing will not only determine its power of resisting the action of the weather, but will determine also whether such foreign ingredients as iron pyrites may exist in the mass. Chemical analysis may be resorted to, for the purpose of comparison with specimens of known composition and durability; but chemical analysis alone cannot determine, without other testing experiments, the strength or power of endurance of the stone.

In some countries, and in certain localities in our own country, the evidence obtained from ancient structures is available in determining the durability of the stone which has been used. Yet it would seem that this information has been of little avail in many places, where the rebuilding of edifices is repeated every century. Experience in many cases does not teach the lesson anticipated; and when a dilapidated structure is pointed out, the argument is made that "these stones were not well selected," or they were obtained "at the first opening of the quarry, and were not as good as now furnished." And again, as already remarked, there are few cases in which parties are permitted to select the material without prejudice, the influence of interest, or the absence of important information. Examples are everywhere before us of the improper selection of materials for buildings, and these examples do not deter from their use in the erection of others. When good material is abundant and accessible, it will be used; in other situations, comparatively few durable structures are likely to be erected.

SOMERSETSHIRE ARCHÆOLOGICAL SOCIETY.

THE twenty-second annual meeting of the Somersetshire Archæological and Natural History Society commenced at Wincanton on Tuesday week, under the presidency of Sir William C. Medlycott, Bart. At twelve o'clock the members and friends assembled in the Townhall for the transaction of the annual business of the society. Sir William Medlycott was elected President for the ensuing year, after which Mr. W. A. Jones, general secretary, read the financial statement, from which it appeared that there was a balance in favour of the society of £121 13s. The total receipts for the year amounted to £247 5s. 10d., including the previous balance of £35 17s. 7d. The report stated that the operations of the society had been well sustained during the past year, and that the volume of "Proceedings" in the press would be delivered to the members before long. Many valuable additions were stated to have been made to the museum of the society," which is every year becoming more and more recognised as the most suitable depository for all objects of interest illustrative of the archæology and the natural history of the county. The report went on to recommend that a memorial should be sent from the society to the Secretary of State for the Home Department, urging Her Majesty's Ministers to take effectual steps for the preservation and protection of the many interesting monuments of antiquity which are scattered over the country, and concluded by announcing that Mr. W. Ayshford Sanford had resigned his position as one of the general secretaries of the society.

The balance-sheet and report were unanimously adopted, and it was resolved, on the motion of Mr. John Batten, seconded by the Rev. Canon Meade, "That it be an instruction to the Council to procure a list of such memorials of the class referred to in the report as it would be desirable to place under the care of the State, and to obtain, if possible, the co-operation of the proprietors of those memorials in carrying out the wishes of the society." The vice-presidents were then re-elected, with the addition of the Bishop of Bath and Wells and Mr. William Long; the treasurers were also re-elected, with Mr. Jones and Dr. Pring as general secretaries, and the following gentlemen were appointed members of the committee, in the room of those retiring by rotation:—Messrs. W. P. Pinchard, J. F. Norman, W. M. King, T. Meyler, J. Marshall, and J. E. Anderson. The local secretaries were re-elected (with the addition of Mr. Ayshford Sanford and the Rev. H. D. Wickham), and the appointment of Mr. William Bidgood as curator of the society's Museum at Taunton was confirmed.

The first paper read was "Civil and Historical Notices of Wincanton and its Neighbourhood," by the Rev. H. D. Wickham. This was followed by "A Notice of the Life of Lord Chief Justice Dyer" (who was a native of Wincanton), by Mr. Arthur Jones. Next in order came the Rev. Mr. Heal with "Notes of the Parish Church of Poyntington;" and after a paper read by the Rev. Mr. Barnes, "On a few points of Somersetshire History as shown by Language," the meeting adjourned. Some of the members then visited the church, and at 4.30 a *dejeuner* was served at the Greyhound Hotel, about thirty-five sitting down to table. In the afternoon the party visited the temporary museum in the National Schoolroom, and at 6.30 a second meeting for the reading of papers was held, when the following was the programme:—The President, Sir William Medlycott, "On the Civil War in Somerset, as detailed in an ancient and rare pamphlet;" Mr. Emmanuel Green, "On the Battle at Langport;" Mr. John Batten, "On the Sequestrations in the Manor of Catsash;" and Mr. E. T. Stevens, of Salisbury, "On Flint and Stone Implements, with reference to some specimens in the Blackmore Museum."

On Wednesday the members of the society and friends had an excursion (starting from Wincanton at 10 a.m.) to North Cadbury, Cadbury Camp, Compton Church, and Mapperton; and on Thursday they went to Templecombe, Stowell, Milborne Wick Encampment, Milborne Port, and Henstridge, reaching Templecombe Station at 7 p.m. The members were invited by the President to luncheon at Ven.

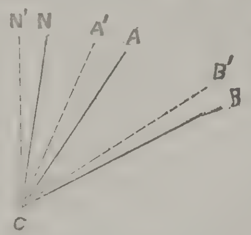
The foundation stone of a new Corn Exchange at Doncaster will be laid on the 22nd inst.

The Surveyor.

THE PRISMATIC COMPASS.

IN our articles under the above general title, most of the field instruments employed by surveyors have been described, their advantages investigated, and the manner of using them expeditiously and correctly explained. There are still some others to which we have not hitherto adverted, but which are well worth the attention of members and intended members of the profession. We are not referring to any that, although they may have been valued in earlier times, are now obsolete or nearly so, having been replaced by more accurate and delicate instruments, but to those which are among the recognised types daily made use of in all field operations. The prismatic compass is a valuable little instrument, the observations of which, as its name implies, depend upon the natural and immutable relations that exist between "the needle and the pole." It is not our intention to illustrate it by a drawing, or to describe its construction minutely, which would amount to nearly the same thing, but merely to refer to such of its principles and details as will suffice to render the working of it, and the registration of its observations, distinct and comprehensible. Our readers will find the other information in any of the catalogues of the makers of surveying and philosophical apparatus. Similar to many other instruments of this description, the prismatic compass was originally intended for military purposes, its extreme portability and facility for measuring angles rendering it exceedingly well adapted for taking flying observations. As will be seen as we progress, it is not suitable for recording the angles of any of the large or main triangles of a trigonometrical survey, or of any field work of an important and extensive character, but it becomes very useful in what is termed "filling in" the details of a survey. When the principal main lines have been ranged and the base angles ascertained and checked by means of the transit and theodolite, then those larger and more cumbrous instruments may be safely laid aside, and the interior work or details obtained by the prismatic compass or the pocket sextant.* The prismatic compass may be held in the hand, or supported on a small tripod stand, according to the nature of the survey. When the latter method is employed, the angles can be observed with a much greater degree of accuracy than would be expected from so small an instrument. Some examples of this instrument are made expressly for mounting upon a stand, and are supplied with a couple of levels, placed at right angles to one another, to ensure the whole apparatus being set up horizontally, which, it is scarcely necessary to remark, must always be done, whether it is held in the hand or supported on a tripod. When, however, levels are added, a tripod is used, and the size of the instrument increased, it becomes a question whether it does not lose its peculiar advantages and should not be replaced by a small transit or theodolite. All surveying instruments should be used strictly for that description of work for which they are best adapted, and it is unadvisable to make them serve for purposes for which a different instrument is the better suited, by adding to them various appliances and appendages which do not really and properly belong to them. Each should be sedulously restricted to its own sphere of action and not allowed to entrench upon that of another. As an instance in point, we may allude to the fact that theodolites are sometimes used for levelling, where a level is the proper instrument. It is true that one "*can* level" with a theodolite, but it should not be employed for the purpose, except under very peculiar circumstances. In those cases the ground is not actually levelled over, but measured, and the angles of elevation and depression taken, which is the proper duty of a theodolite. One would not measure a yard of carpet with a pair of compasses, although it "*could*" be done without any great difficulty.

The essential difference between the ordinary compass and the prismatic compass is that one of the "sights" of the former is replaced in the latter by a prism—hence the name. By means of this prism the object, or rather its bisection by the vertical wire, is perceived at the same moment as the reading of the angle it makes with the magnetic meridian. The prismatic compass can therefore be used both for ascertaining the magnetic bearing of any one particular object, or the actual angle between any two or more objects. There is a close resemblance between this instrument and that which is known as the "miner's dial," but considerable improvements have been introduced in the former, which were altogether wanting in the older instrument. The principle of the prismatic compass will be readily understood from a reference to the accompanying diagram. Let the line C N represent the zero line of the instrument, or the direction of the magnetic meridian. It is the duty of the maker to see that the vertical plane of the upright wire or "sight" passes through the zero point. Any instrument that does not on first inspection fulfil this condition should be at once rejected, for although an allowance could be made for it, still the accuracy of the observations might be imperilled in consequence. In the diagram let A C N be the angle observed by the compass when the sight is directed to an object at A. The angle A C N will then be the magnetic bearing of A. Let the sight be now directed to B, and the angle read off through the prism will be B C N, the magnetic bearing of the object at B. The actual angle between the two objects at B and A is evidently equal to A C B. But the angle A C B is equal to the difference of the two magnetic bearings of the respective objects. Thus we have angle A C B = (B C N − A C N). There is one advantage possessed by the prismatic compass which is peculiar to all the methods of measuring angles depending upon the magnetic law. It is that any error in the direction of the original line C N, or azimuthal line, does not affect the actual angle between any two objects, provided that the observations themselves be correctly taken. Referring to the diagram, suppose that the slit in the prism is not placed diametrically opposite to the sight, and consequently the line which should be in the position shown by C N becomes altered to that of C N′. It is of no importance what may be the real cause producing a change of direction in the azimuthal line, only let us consider it to be altered to C N′. If the separate angles are correctly observed, we shall always have the angle A′ C N′ equal to A C N, and the angle B′ C N′ equal to B C N, and consequently (B′ C N′ − A′ C N′) will equal B′ C A′, which will always equal B C A, the actual angle between the two objects at A and B.



The minuteness with which angles can be observed with all instruments manifestly depends upon their size, as a large circle can be more closely divided than a smaller one. For example, a five-inch theodolite cannot have its horizontal limb divided into a greater number of subdivisions than what will permit the vernier to read to twenty seconds, or the third part of a minute. But if the diameter of the limb be increased to six or seven inches readings can be readily taken to ten seconds and less. Some of the theodolites employed by the Royal Engineers in the great trigonometrical survey of England and Wales were constructed with the horizontal limbs three feet in diameter. This will give some idea of the surprising degree of accuracy to which the observations were carried, and also account for the very successful manner in which the whole of the trigonometrical operations were conducted. It is the fault of all instruments acting upon the compass principle that their subdivisions cannot be pushed to the same limit as those of more expensive and more delicately made ones. In the ordinary examples of the prismatic compass the card cannot be subdivided to more than the third part of a degree—that is, to twenty minutes, but it will read to half this, or to ten minutes, by "estimation," as it is called. It must, at the same time, be borne in mind that this estimation depends for its accuracy altogether upon the practice and judgment of the observer. As a rule, beginners had better not attempt to subdivide the divisions of the card, but read off the one nearest to the line of sight. In order to take angles between objects situated either above or below the plane of the instrument, it is provided with a small mirror, which acts as a reflector. By its means the magnetic azimuth of the sun can be obtained, care being taken to interpose the dark glasses between the sun's image and the eye. An objection to the prismatic compass is that it is quite impossible to use it in very windy or stormy weather. This, to a certain extent, is true, and the remark in a less degree will apply to nearly all field instruments. But an experienced surveyor, and one who is accustomed to the compass, will do accurate work with it in situations and under circumstances where some men could hardly take an observation at all. There is always some amount of truth in the old saying, "Bad workmen complain of their tools." Unless when the survey, such as one of a military nature, forbids the employment of a tripod-stand, it will be found greatly to conduce to the comfort and precision of the work, and it is small, light, and easily carried, and ensures the horizontality of the compass and the free play of the card much better than even a practised hand can do. There are no levels required in using a stand. It is simply set up by shifting the legs of the tripod to and fro until the card is perceived to play easily and freely on its centre. Any one accustomed to setting up either theodolites or levels will in a minute or two put up a prismatic compass in order for taking observations. If it is intended to hold the instrument in the hand, it is questionable whether the pocket sextant will not prove more serviceable, unless the objects to be observed are situated far out of the horizontal plane of the observer.

---

* For a full description of this useful little instrument, and the method of using it and registering the observations, *vide* the Building News for March 11th, 1870.

◆

THE KENSINGTON-ROAD "IMPROVEMENT."

MR. AYRTON is not vanquished, if the report in the *Kensington News* be true that another attempt is to be made to induce Parliament, in the next session, to sanction the course of spoliation of Hyde Park and Kensington Gardens, which but two or three months ago excited such a storm of indignant feeling on the part of the public :—"According to the plans for which estimates are now being obtained, the Flower-walk is to be sacrificed ; the railing which separates the Gardens and the Park is to be taken down ; the portion of the Park which lies westward of the Alexandra Gate is to be cut off and thrown into the Gardens ; the elms which fringe the Kensington-road are to fall or be removed ; the road is to be set back, and a crescent with a flight of stone steps formed in the centre, leading up to the carriage-drive between Queen's and Alexandra Gates ; the roadway is to become then merely a landing-place between the first and second flights of steps up to the Prince Consort Memorial ; and a large space of ground, part of which belongs to the Park and part of it to the Gardens, is to be planted out as an Italian garden at the base of the Memorial. The object of placing a vast mound of earth just to the west of the Memorial can now be perceived. There is to be an extensive 'levelling-up' in that quarter ; and the communications of Queen's Gate, Hyde Park Gate, and Kensington-town with Hyde Park are to be completely severed. These plans are based on the hypothesis that Parliament and the people will stand by to see the lands (which are properly theirs) despoiled, and at their own cost."

JERVAULX ABBEY.

JERVAULX was founded first of all in 1150, at Fors, near Askrigg, but that situation was found to be so cold and bleak that the monks soon removed to the banks of the Eure. It belonged (says the Rev. John Pickford, M.A., who recently visited the ruins), like the other Yorkshire abbeys of Rievaulx and Fountains, to the Cistercians, and was a noble pile. The last abbot was Adam Sedbergh. A fine screen, now preserved in the chancel of Aysgarth Church, removed from Jervaulx, was most probably, from the initials upon it (A.S.), erected by him in the abbey. The church has been a noble building, measuring 270ft. in length, and in it is a fine collection of sepulchral slabs, which once marked the graves of the abbots. The site of the high altar is clearly marked out, and at its east end is the chapel of Our Lady, somewhat similar to the chapel of the Nine Altars at Durham Cathedral, and at Fountains Abbey. The Chapter House has been a fine room, measuring 48ft. by 35ft., and has had its roof supported by columns. In it some of the abbots found a sepulchre, and it contains the slab of John de Kingston, inscribed more than 700 years ago. The kitchen is well worth inspection, with its huge fireplaces surrounded still by fenders composed of stones. The marks of the fire yet remain in the ample chimneys, and the arched openings in the wall through which the dishes were handed to the refectory are perfect. Though Jervaulx does not possess the magnificence of Fountains, the noble choir of Rievaulx, or the beautiful foreground which is the great charm of Bolton Priory, yet in some points it yields to none of the Yorkshire abbeys, and its fine collection of sepulchral slabs renders it one of the most interesting ruins in the kingdom to the antiquary.

WEST FRONT OF WELLS CATHEDRAL.

THE west front of Wells is a thing which it is the fashion to rave about, says Mr. Freeman, in his "History of the Cathedral Church of Wells." It is the finest part of the church; the finest thing in Somersetshire; the finest thing in England; for aught I know, the finest thing in the world. I am perverse enough to think differently, and to look on the west front as the one part of the church of Wells which is thoroughly bad in principle. It is doubtless the finest display of sculpture in England; but it is thoroughly bad as a piece of architecture. I am always glad when I get round the corner, and can rest my eye on the massive and simple majesty of the nave and transepts. The west front is bad, because it is a sham—because it is not the real ending of the nave and aisles, but a mere mask, devised in order to gain greater room for the display of statues. The architecture, in short, is sacrificed to the sculpture. A real honest west front, if it have two towers, will be made by the real gable of the nave flanked by a tower at the end of each aisle. So it is at York; so it is at Abbeville; so it is at Llandaff. Or a front may, like those of Winchester, Gloucester, and Bath, have no towers at all, but may simply consist of the endings of the nave and aisles, set off with turrets and pinnacles. Or a front may be, like that one glorious and unequalled front at Peterborough, built up in front of and across the endings of the nave and aisles, but without at all professing to be itself their finish. All these forms are honest; but I deny the honesty of such fronts as those at Wells, Salisbury, and Lincoln. In all these cases the front is not the natural finish of the nave and aisles; it is a blank wall built up in a shape which is not the shape which their endings would naturally assume. It is therefore a sham; it is a sin against the first law of architectural design, the law that enrichment should be sought in ornamenting the construction, in giving a pleasing form, and such enrichment as may be thought good, to those features which the construction makes absolutely necessary, not in building up anything simply for the sake of effect. The main features in a front should be the windows and doorways. The small size of doorways is a common fault of English as opposed to foreign churches; but at Wells they reach the extreme point of insignificance in those narrow mouseholes at the end of the aisles, through one of which we are commonly driven to creep, while the west doorway remains shut. But even the west doorway itself is a very small mouthful, I will not say after Laon or Rheims, but after York; nay even at Lichfield and Salisbury the doorways have a little more of dignity than they have at Wells. In a really good design the architectural features ought to be the first thing; sculpture or any other source of ornament should be secondary. At Wells the rule is reversed; a sham wall is built up and loaded with statues, and the windows and doorways are left to shift for themselves.

FONTS.

FONT IN ALL SAINTS' CHURCH, LEICESTER.

THIS church, though in a dilapidated condition, and possessing no striking architectural features, is an interesting building, dating from the Norman period. The lower part of the tower is Early English, and has buttresses of an unusual description. The tower arch, which opened into the north aisle, has been built up, and a small door substituted. The effect of the interior of the church is marred by the gallery at the west end, and the comparatively modern chancel and plaster ceilings. The pulpit is an old one of the Perpendicular style. The Early English font (the subject of the sketch) is in remarkable good preservation, but is almost hidden from view by the pews which surround it.

FONT FROM ST. MARY'S CHURCH, LEICESTER.

THIS curious and interesting font (which forms part of this week's illustrations), is from the well-known church of S. Mary de Castro, at Leicester. It is placed under the tower, the fine arches of which partake somewhat of the pointed horseshoe form. Closely adjoining the tower are two Early English segmental arches, with a fine clerestory of lancet lights above, which were blocked up previous to the restoration of the church. There are many other objects of interest in this church. J. L.

BUILDING NEWS SKETCH BOOK.

XLI.—PRIORY, OLD MALTON, YORKS.

OLD MALTON is situate on the borders of the East and North Ridings. The present church consists of the south-west tower and nave of the Priory church, founded by Fitzjohn. It is a very good example of the Early Transitional style of the country, the west door being richly moulded with carved zigzag ornaments in the arch, and dogteeth. The caps are carved foliage. The mouldings of tower windows are also very bold and good. A door with beak head ornaments remains on the east wall of the north aisle. The triforia is very good indeed, and delicately moulded: it is Early English. There is some late work in the church and old stalls, which have been painted and repaired. The west window is a late insertion, and partly blocked up. In a farmhouse, close to the church, I was told were remains of some fine work, perhaps part of the Priory, but unfortunately I was not able to visit it, being pressed for time. Some stone coffins remain outside the east end, some of great length and very narrow; also one about 18ft. long. The north-west tower has fallen, and only remains 6ft. or 8ft. high. This church is well worthy of a visit by any architectural tourist visiting the neighbourhood. A description of the town, church, and Priory will be found in "York and the East Riding," I believe.

T. C. Wilberfoss.

A WORD FOR CARRIAGE PAINTERS.

THE carriage painters, as a class of artisans, are men who have many trials and difficulties to encounter at every step, I therefore have taken up the pen to vindicate their cause and exonerate them from some of the blame that is too often attributed to them. I will attempt to enumerate some of the difficulties with which they have to contend and overcome, and what is expected of them. In the first place, there is a large amount of inferior and worthless stock in the market, such as paints, varnishes, and japans, and if through ignorance or accident their employers buy this stock, the painters are, of course, expected to test it, and oftentimes are compelled to use it, and although they may condemn the stock, their employer expects a well-finished job; therefore, he is not satisfied with the job if it is not so, and often takes the painter to task about it, when in reality he himself is the cause, by buying inferior materials which can be purchased for a few pence less than a good standard article.

Secondly, they have to contend with and overcome any little defects of the wood-workman. If a joint is not properly made or an uneven place or knot occurs, the woodman often says "*Let that go, the painter can make it all right*," and it is too often the case that too many of such blunders are left for the "*painter to make all right.*" Then when the job comes from the hands of the smith it is often found to be blistered in spots where he has touched it with hot irons, or it has several hammer dents upon it which mar the surface, all of which the painter is obliged to remedy before he can produce a finished job. All this involves considerable expenditure of time and trouble, and often causes hard words. It is, indeed, vexing to the painter, after he has endeavoured to produce a fine even surface, to have it marred by the carelessness of others.

Thirdly, they often have to contend with improper paint rooms and varnish rooms. A good job of painting or varnishing cannot be produced without good rooms that are adapted for the purpose intended. If employers furnish their painters a room for finishing work, which has walls that are continually shaking or even falling down, and during blustering weather the wind rushes through at crevices, he must not expect to get a very nicely finished job, as it is utterly impossible to do one in a room of that description.

In the fourth place, the painter is often assailed by customers who come back to the shop in six months or a year and report that the paint and varnish are perishing upon their carriages, and blaming the painters for a poor job; but when you come to investigate the case, in nine cases out of ten it will be found they themselves have caused the result by housing their carriage in the same room with their horses. It is a hard matter to convince some of them that the ammonia arising from the stable is the real cause.

Therefore, in conclusion, I will say, *furnish your painters with good stock, good smooth woodwork, good rooms and tools;* then if he does not produce good work it is his fault and no one's else. Wadsworth.

COMPETITIONS.

Bramley.—The Guardians of the Union of Bramley, near Leeds, having determined to erect a new workhouse to contain 250 inmates, lately advertised for designs, offering two premiums of £50 and £25 respectively. The buildings are estimated to cost about £9,000, exclusive of the boundary walls, value of land, &c. Fifteen sets of plans were submitted from architects in London, Liverpool, Leeds, &c. The designs of Messrs. C. S. & A. J. Nelson, of Leeds, have been selected for the first premium, the second being awarded to Messrs. Wade & Turner, of Barnsley. The works are to be proceeded with at once, under the superintendence of Messrs. Nelson.

Epsom.—The Epsom Burial Board have in a limited competition selected the designs by Messrs. R. M. Shaw and W. Young, of Exeter Hall, Strand, and Crooked-lane, City, for the chapels, lodges, gates, &c., to be erected at their new cemetery. The selected designs are in the Early Gothic style, of a decidedly English character, and with a picturesque treatment. The works are to be commenced immediately, under the superintendence of the above-named architects.

Hereford Cathedral Illuminated.—At the Hereford Musical Festival on Tuesday week, the Cathedral was lighted up with singular effect. A correspondent says:—Many persons have doubtless seen the magnificent spectacle of Cologne Cathedral lighted up by coloured fires; others may have witnessed our own S. Paul's illuminated; and familiar sights are the choirs of our Cathedrals on winter afternoons by dim gas or candle light. But the entire nave of an old Norman church illuminated, with its massive piers casting long and deep shadows around, is a sight which Hereford Cathedral alone affords. The effect is grand in the extreme, and the gloom, which the light throws into contrast, truly impressive.

Furniture & Decoration.

THE THEORY AND PRACTICE OF MODERN HOUSE PAINTING AND DECORATION.

By AN EXPERIENCED WORKMAN

PREPARATORY PROCESSES.

(Continued from page 155.)

OLD woodwork when about to be repainted requires much care in its preparation. Of course, the amount of labour required will depend upon the state of the work. If it is in pretty good condition, rubbing down with pumice-stone and water may suffice to bring it right for painting; but if it is very old work, which has had a great many coats of paint put upon it time after time for a long series of years, and has chipped or cracked, it may be necessary to remove the old paint altogether, as being the quickest and best remedy to apply. Or it may be that the work is sound, but uneven and full of slight hills and hollows; in this case it may be filled up either with distemper filling, or with quick varnish filling. In the first case, when the work only requires rubbing down with pumice-stone and water, the workman should proceed as follows:—In selecting the pumice-stone for this purpose, the close-grained and harder kinds should be rejected, and only that used which is of an open porous nature, the former kind being apt to clog up and scratch the work, while the latter will do the work effectually. The work will be facilitated if a little ground or powdered pumice-stone is used with the lump. The loose pumice assists the lump to bite or cut better, and also prevents its clogging with the paint—for it will often happen that if the pumice be rather hard, and the paint dry (through not having much oil in its composition), the paint will gather upon the face of the pumice-stone and prevent its biting, rendering it, consequently, of no effect, which fault the loose pumice in a great measure prevents. In rubbing down, it is best, and answers the purpose most effectively, to move the hand in a circle as much as possible. and not straight up and down. The circular movement will produce a level surface, as it touches every part equally; but the straight up-and-down rubbing tends to produce an unlevel and streaky or ropy surface. It is necessary for the workman to have a piece of flagstone beside him when rubbing down to level and clean the pumice-stone, or to rub it into shape, so that he can get into corners and angles. In rubbing down the mouldings the pumice-stone may be cut with a fine saw, and rubbed or filed to the exact shape to fit the moulding. This is very easily done, and is the most effective means of getting at the various parts of the moulding. Ground pumice-stone and felt may be used also for this purpose, but will not be so effective in the first instance as the lump in clearing off any roughness or protuberances. The pumice should be wiped off with a wet sponge occasionally during the rubbing down, to see what progress is being made. When it is rubbed down sufficiently, the whole must be well cleaned off with water, in order to remove all loose particles resulting from the rubbing. This should be carefully done, or else the grit will work up in painting, and thus make the work rough again. When the work is in pretty good condition after being rubbed down, it may perhaps only require facing-up here and there with hard stopping preparatory to painting; but if it is in bad condition, and requires filling up, it must now have a thin coat of oil-paint. When we say a thin coat we mean a bare coat—the oil-colour must be rubbed as bare as possible, because if there is too much paint put on the work it will not harden sufficiently to bear the rubbing down after the filling-up colour is put on, but will tear or peel up. The oil-colour forms a key for the distemper filling to hold by, and if distemper filling is placed upon old work without this coat of oil-colour it will not hold but will chip off in working. What is here called filling may be mixed in several ways, and is used for the purpose of producing upon the surface of woodwork or plastered walls an even, level, and uniform surface. Staircase walls are sometimes filled-up in distemper, but rarely with a good and lasting effect; for we have found this sort of filling more liable to fail on staircase walls than in a warm room. In damp weather the size in the distemper filling is affected and softens, and in dry weather it contracts; and so, between the two, sad havoc is made with the paint and varnish which covers it.

Distemper filling is made with the best washed whiting and glue or parchment size. The whiting is broken up in water to the consistency of a stiff paste; sufficient size is then added to bind the whiting, so that it will rub down with sand-paper without crumbling away in rubbing. The quantity or proportion of size to whiting must be determined by the workman himself. It is best to test the mixture by actual experiment before using, for if there is too much size in the stuff it will not rub down when dry, and if there is too little size it will crumble away under the sand-paper; so the safest and best plan is to mix the colour and try a portion upon a part of the work. Let it dry, and then test it with the sand-paper; if it rubs down easily, and without crumbling away, and leaves a smooth face, then the stuff is all right, and the work may be proceeded with confidently; but if it crumbles, it will require more size to be added. If, on the other hand, it is too hard, and the sand-paper will not cut it, then it must be reduced with water, and more whiting added. In the act of rubbing down, the sand-paper must be placed on a flat piece of wood, as before described. Placed thus, the sand-paper will, of course, operate upon all the projecting parts, leaving the hollows filled with the distemper, thus producing a level surface; but care must be taken not to press heavily, or the paper will scratch and break up the filling. Gentle rubbing will alone effect the end in view. When the work is as level as it can be got, and it is found not to be sufficiently filled up, another bare coat of oil-colour must be put upon it, and when dry, another coat of filling, and so rubbed down again as before, until a level surface is produced. It must be noticed here, with regard to distemper-filling, that the less body there is left upon the work the more likely it is to stand without cracking; and, as a rule, it should be rubbed down until the paint appears on all the prominent parts. It will thus only leave the filling in the hollows and uneven places, where, of course, it is most required.

Quick, or varnish filling, is a mixture of white lead, japanners' gold-size, or quick-drying varnish and turpentine. There are several sorts of powder used to mix with the paint instead of white lead. Spruce ochre is used by the coach-painters, and there is a black or lead-colour powder sold for this purpose; but in practice we prefer to use the ordinary white lead, ground in oil, with sufficient copal varnish or japanners' gold-size to bind and harden it, so that it will rub down when hard; but of course it will take some time to harden, and, in fact, ought to stand a few weeks before being rubbed down. But when so treated, we have no doubt of its being the best filling, in every respect, that can be used, for it rubs down well to a smooth hard surface, and the oil contained in the lead has a tendency to prevent the work cracking afterwards—this liability to crack being the great danger, and, in fact, the great failing of most of these compositions for filling up painted work. It frequently happens that after immense labour has been bestowed upon the work in preparation, and after it has been expensively painted and ornamented, it will, in course of a year or so, begin to crack all over its surface, until it becomes one mass or network of cracks, which, of course, spoils and ruins the work. We have seen numerous jobs (executed by some of the first firms in the kingdom) which have turned out bad in the manner described, and this has solely arisen from the fact of the filling having been either too quickly followed up, one coat upon another, or else from the colour being improperly mixed. Filling-up colour is also made with dry white lead ground in turpentine, sufficient varnish being added to bind the lead so as to enable the same to be rubbed down. We have found by experience that it is always best to add a few drops of boiled linseed oil. When the filling is mixed as above it gives tenacity to it, and consequently it is less liable to crack. If there are any holes or indentations in the work, they must be faced up with hard stopping before the first coat of filling is laid on. Varnish filling differs from distemper in the fact that we can lay on as many coats as we like, one upon the other, which cannot be done with distemper. Each coat of filling should stand one day at least before another coat is put upon it, in order to allow the turpentine to evaporate. Four or five coats may be laid on until there is a sufficient thickness to rub down to a level surface. When the filling has stood long enough to harden it may first be rubbed down with lump pumice-stone and water, as before described, great care being taken that no scratches are made. A deep scratch will necessitate the work being filled-up again, and so much labour will be lost. The dark-coloured filling-up powder may be used upon all work which has to be finished in dark colours, but is inadmissible when the work has to be finished in light tints of colour, as it requires so many coats of paint to cover the dark filling that the work necessarily becomes roughened or coarser than in the former case. Any slight scratches may be obliterated, and the work brought to a fine surface, by finishing the rubbing down with felt and finely-ground pumice-stone and water. Ground or powdered pumice may be had of various degrees of fineness, which may be used for different stages of the work—commencing with the coarse and finishing with the very fine on such work as requires it. The felt here spoken of is a thick white felt, made almost expressly for polishing marble and paint and varnish work, but is used for many other purposes besides. It varies in thickness, but the thicker it is the better for our purpose, so that it is made without any coarse fibre or other foreign matter mixed with it, as in that case it is liable to scratch the work. The felt should be fastened to flat pieces of wood of various sizes and shapes. A strong solution of shellac in wood naphtha makes a good cement to fasten the felt to the wood. Any strong resinous gum that will not dissolve in water will answer the purpose.

(To be continued.)

◆

DIARY OF THE ARCHITECTURAL ASSOCIATION'S LINCOLNSHIRE EXCURSION.

BY A MEMBER.

"ADMIT P. Q. R., Esq., to the several visits and excursions under the direction of Edmund Sharpe, Esq., M.A., from August 22nd to 27th, 1870."

Monday, August 22.—London to Lincoln, credentials as above. Great Northern Railway, Hitchin, Huntingdon, flat land to Peterborough, towers and spires and three-arched west front. Grantham: some of our number here by wrong train, have "done" the town in this $\frac{3}{4}$ hour. Railway down the Witham Valley; the South Cliff villages to the right, grey churches, trees, here and there tinged with autumn. Lincoln; a small troop emerges from the train in thick boots and grey cutaways and chummies, the dandies in figured waistcoats and neckties. Walk to the White Hart—Steep Hill, a (not) nominal insult ?

But does not that huge mass gain grandeur enough to make amends?—Jew's House, looks shaky, should be de-colour-washed—Smells, haven't by heart S. T. C.'s vigorous verse "Odeurs de Cologne," useful for quoting in country towns. Lunch. 2 p.m., Mr. Sharpe on the Cathedral, in the Assembly-rooms; Bishop, clergy, a few ladies; general sketch of history and forms of Gothic art:—

Black ... (Chocolate)	Norman Period	Circular arch alone used.	1066 to 1145
Blue ...	Transitional	Conflict between circular and pointed arch; emancipation from direct Norman influence.	1145 to 1190
Green ...	Lancet	Name from form of windows.	1190 to 1245
Yellow ...	Geometrical	The circle in window tracery.	1245 to 1315
Orange ...	Curvilinear	Free curves in window tracery.	1315 to 1360
Red... ... (Magenta)	Rectilinear	Right lined forms in window tracery.	1360 to 1500

Indicated thus by the colours of the Prismatic Spectrum.

A diagram to each member: these names used in all descriptions throughout. At Lincoln a complete series; portions in style of each period; strongest in quantity and perhaps in quality in Lancet and Geometrical. Subdivision of Rickman's divisions for increased accuracy of expression. Value of the study of mouldings: in conjunction with the forms of buildings they are the surest evidence for architectural history—a great comparative anatomist can deduce the form of an animal from a single bone; by proper use of study of mouldings a building may be dated with confidence within four or five years. Fully developed Gothic in the work of Bishop Hugh of Grenoble (S. Hugh of Lincoln) 1190 to 1200; emancipated from Romanesque influence; pointed arch used both for construction and decoration, each main order of arch mouldings specially prepared for on the jamb, with shafts, &c., caps with hollow bells, not bulged as earlier. Service at cathedral at four — drowsy. Dinner. Evening meeting at Assembly Rooms at eight; lecture by Mr. J. H. Parker. The work of Hugh of Lincoln the *earliest* true Gothic work in Europe. The work at S. Denis explained—Abbé Suger's work commenced 1140, pointed arches with Romanesque details (not in the upper church or the west front) only in the under chapel. Photographs and sketches to illustrate this. Bishop Hugh's life traced, and the buildings with which he was connected. He employed local architects—Geoffry de Noiers (Hugh's architect at Lincoln), probably, almost certainly, a native-born Englishman. A few words from Bishop Wordsworth. "Thrones and dynasties pass away. Cathedrals seem likely even to outlast the nations that built them. Something to rest against. Why have our cathedrals no accepted place in our modern life?"

Tuesday, August 23.—11 a.m. The cathedral described on the spot by Mr. Sharpe. Beak-head, north doorway of west front, latest trace of true Norman work; Transition in south doorway of west front more marked, probably a year or two of difference; quick spread of new features through the country; work of same kind practically contemporaneous. Bishop Hugh's work; his mad architect, G. de N.! (so called by Prof. Willis); experiments, and an infinite vivacity, vigour and originality—full Gothic at a single bound. A D. 1240, west doorways of choir aisles, perfection of mouldings and carvings. Presbytery (angel-choir), the glory of Gothic. How to finish the vaulting which has been built, part in ashlar and part in rubble. Mr. Sharpe advises "Use colour to harmonize, not to obliterate, traces of constructive masonry." Mr. J. H. Parker replies, "These buildings were designed for colour and were coloured—colour should be restored; wax colours advocated; damp does not injure them—subdued tones." (Is not this question affected by the nature of our ancient buildings, which we maintain as art museums, part of national and architectural history? They derive value from the idea of *genuine antiquity*; their value is in their forms, which are mainly intact: The colour can only be conjecturally reconstructed. Why attempt to bring such buildings quite within the range of modern living art?) Admitted to the Dean's garden, from which is obtained the best north view of the cathedral. Lunch. Bishop's palace; ruins, trees, and shrubs; the present house a mere block. View over the town, opposite side of the valley shrouded in grey smoke (foundries, &c.). 5 p.m., the town churches, S. Peter's Gowts (goutes, or drains) and S. Mary-le-Wigford; John of Gaunt's stables on the way—Norman, nearly a ruin. Good early work in both churches. Dinner. Thanks to the Rev. G. Hervey (secretary of local association), for obtaining for us every possible access to cathedral, &c. Responded to—"Come again." 8 p.m., meeting in assembly rooms. Mr. Sharpe on mouldings. The cymagraph of Prof. Willis improved by Mr. Sharpe. Accurate delineation of mouldings full size; most ingenious contrivances for construction of diagrams and their exhibition. Mr. Sharpe's, large collection the basis of accurate knowledge; has not theorized in the air. Ladies with us in Cathedral. One grave member states his attention is divided between the architecture and the Graces. Later, a spirited portrait discovered in sketch book of severe paterfamilias, appropriately among sketches of Angel-Choir—a face that might well have served for model to the sculptor employed there.

Wednesday, August 24.—Train, Lincoln to Caythorpe, 8·15 a.m. Carriages.—1. Caythorpe spire (well-rebuilt): curious double nave, half arch abutting against chancel arch.—2. Fulbeck. Good base courses. The cymagraph at work. Arrangement of tower and nave pinnacles and parapets admirable.—3. Leadenham. Mouldings, buttresses, tower, and spire.—4. Wellbourne. Sanctus bell and cross. East gable of nave. Remarkable entasis to spire: has spire been shortened? The effect peculiar but not unpleasing. "Properly an entasis is too strong if you can see it." Lunch under a tree.—5. Wellingore. Lead work of roof sloped rolls (on plan); effect not approved—disturbs lines of the architecture (also in new work, chancel roof, Spalding Church); good oak seats. Rectilinear.—6. Navenby. East windows (Curvilinear) mutilated, six-light; good remains. Piscina, sedilia, and Easter sepulchre. Carving a high type of conventional foliage.—7. Coleby. Font of interlaced Norman arcades; admirably managed transition of tower to spire. Pinnacles, buttresses, diversified parapet. Sketch of main points of interest by Mr. S. inside and outside each church.—8. Harmstone. Nave and chancel restored by Mr. Withers (modern polychromy). Norman tower arch.—9. Waddington—details.—10. Canwick. A detour from the route as settled. Norman ground story of nave in good condition. The whistle sounds, and the last rush to carriages takes place.—Back to Lincoln. Notes and drawings compared, and interchange of cymagrams in the evening.

Thursday, August 25.—Breakfast at 5·30. A very early start. Train to Boston, past Tattershall Castle on our left. Its great tower of brickwork 150ft. high, a lordly fortress! Morning papers: sad news from France. By "these Lincoln Washes," one recalls Philip Faulconbridge, in "King John."

This England never did nor never shall
Lie at proud foot of a conqueror.
Come the three corners of the world in arms,
And we shall shock them. Nought shall make us rue,
If England to itself do rest but true.

1. Sleaford. Large double-aisled Curvilinear church; the first of the broach spires we have had. Carriages; ladies, squires, and clergy, not to be daunted by any call for exertion; enthusiastic for archæology, old churches, and substantial lunches.—2. Silk Willoughby. Spire—"octagon spires on square towers best seen from angle of 105 to 110 deg. with one of the sides—not from extension of diagonal, set too much into the towers there. Get away a fair distance, then all the charm of their form."—3. Osburnby. Late oak seats. "I suppose ye want 'em for patterns," says a farmer with a glowing face. Pattern-books at work.—4. Threckingham. Curved broaches to spire. Ridge curves strongly marked; valleys consequently. Variety and ease. Geometrical spires rare; this a good specimen. Lichen on stonework; wonderful sharpness of mouldings.—5. Billingborough. Tall pen-pews. Curvilinear tower and spire—flying buttresses—too light to look "a purpose;" (rarely have any beyond filling in the outline.) Young ladies' college out for exercise. Enthusiasm of "the boys."—*Billingborough.* Lunch at inn.—Pleasant walk of a mile to (6.) Horbling. Ruin of central tower; affected entire history of church; now not vertical, tied with Brobding T-ties of iron. Mr. S. points the moral of all these cases —"Look to your foundations." West window, large five-light; "use of transom in Rectilinear work to reduce the long-drawn-out lights to pleasing proportions." "Put stained glass in west windows (beautiful afternoon effects); avoid it in clerestories; darkly painted glass deprives of light, hinders appreciation of form."—7. Swayton. The chancel has double asterisk ** (unusually interesting) in Mr. Sharpe's list (so kindly furnished to each member), deserves ⁂. Most refined elegance; very early Geometrical. Many of these churches—gems in good setting; trees, green churchyards (not so green now!) with lichened stone boundary walls, farmhouses and cottages, orange with lichen.—8. Helpringham; unrestored. The word "restoration" getting an unhappy tinge of not quite pleasant meaning equivalent to *renovation.* What is a good fresh word for putting-back-again-in-*statu-quo-ante*-the-Vandals? Lancet font of sunk arches and octagon angle shafts—receptacle for candle-ends and sticks, dusters, mops and brooms—and painted and veined a blood red! "Here's a Golgotha"—from Reparationist. Picturesque turret, top of rood loft stairs giving entrance to gutters of roof. Pattern books handled actively. Children in open tower—with bell ropes hanging. "Where going? To ring the bells?" asks our leader of them, paternally. "No, to Help-ring-'em," responds a flippant pattern-booker.—9. Heckington. A little cathedral—dignity. The carving of chancel fittings, piscina, sedilia, Easter sepulchre, &c., full of grace and genius: angels, foliage, grotesques. View from tower—Ewerby spire, &c., in the distance. Departure of an accomplished cymagrapher, Mr. S. says (till lately) his only rival in the world.—Dinner at Railway Hotel. Cymagraph. Moulures and molars. Good effect as to latter at least. Architectural joke! Train to Boston. Vocal harmony; clatter of train and engine suitable instrumental accompaniment.

Friday, August 26.—Boston Church, opened for us at 6 a.m. "The Stump;" view over the Deeps, five or six miles off, great perfection in masonry. W. Stukeley, M.D., Itin. Curios.—"from Barneck Pits." "No part of England has so many beautiful churches" (as his native Holland, Lincolnshire). Old woodwork—odd misereres and stall ends—restoration admirable; Pescod (green-peas) brass. Marble statue of Herbert Ingram in open space at east of church. Good market-place; seems a town without streets, lanes only.—8.15 train to (1.) Long Sutton. Carriages. Early transition, ground and clearstory of nave—clearstory now has aisle roof over it, and a tall later story above.—2. Gedney. West tower, buttresses, windows, trings, free and fresh Lancet, lots of Rectilinear clearstory windows, roof; ladders here as elsewhere, for use of enterprising seekers—

Half-way down
Hangs one that gathers *mouldings*, dreadful trade!

3. Fleet. Detached tower, curvilinear; not joined to church or designed for junction; picturesque north-east turret, stone roof and pinnacle, eight corbels to nave roof inside; "some of the most beautiful carved work to be found anywhere."—4. Holbeach. Mr. Ewan Christian at work here; all admire his nave roof. Pews cleared away; chairs on the old floors while further funds are got together. Original Curvilinear oak south door; tracery separate and scribed on. Lunch at inn. A few words of thanks to Holbeach parson; his reply cheered to the echo. "That's *a man*" from our Reparationist friend.—5. Whaplode. Norman chancel arch and east part of nave, Transition west part of nave. Norman piers surely prepared for different arches? Did they stand sometime and then get their superstructure? Clearstory—nearly as at Sutton, but windows larger—has not been restored! Odd that unfurbished churches are most piquant of all!—6. Moulton. Reversed curve in flying buttresses at base of spire; great grace of form. Tower in stages, set off at each and each, stage battering. Characteristic foliage, north and south of nave, cut with spirit (Transitional).—7. Weston. Mr. Moore, now vicar of Spalding, was incumbent here; church restored (no trace of evil meaning in the word this time). Age not destroyed, and

yet the building youthful for strength and endurance; evidences of much intelligent care; bar the inscription on chancel arch, hits the eye painfully, vulgar colour and form. Foliage (latest Transitional) in nave; relief. Font, a ring of sketchers and measurers. Mr. Moore's suggestion that shafts were prolonged to the base pronounced highly probable. See "Brandon's Analysis," Sec. i., E. E. 37, where, however, the jointing is not shown.—8. Spalding. As to Mulciber's work (*driven* in *this* case by a shower of rain)—

> The hasty multitude
> Admiring enter'd, and the work some praise,
> And some the architect; his hand was known.

(Mr. G. G. Scott.) Explanation by the Vicar. Much to see. Lancet church transformed in geometrical period. Shafts of nave lengthened full 6ft.; old caps replaced and arches rebuilt. The carving of rectilinear period mainly (inserted). Two-story porch at north-west of church, fan-vaulted with four quarter-conoids. Tower was all but lost; has been underpinned. Foundations on the surface, graves almost under the walls. Reversed curve buttresses to spire. New pulpit exquisite, like ivory carving; no woodwork, old or new, in this journey to compare with it. Needlework, fine cope. Beauchamp family. Drawing in Spring-Gardens Sketch-book. Dinner at the Red Lion (house with a red face; the White Hart just by has a white one. Chromatic illustration). Thanks to the Vicar of Spalding for his help and his company with us to-day. "If you go on with your cheese, I'll thank you," says the Vicar. The evening, the idea of calm embodied. Faint orange sky, distant soft grey clouds. Rail to Peterborough. Great Northern Hotel.

Saturday, August 27.—Each man for his own head from breakfast at 8 to 11. Then Mr. Sharpe, in and round the Cathedral. A complete Norman interior of great majesty and unity. Choir, nave, and transepts. Later work at west end, Transition; then the west front, towers, &c. Rectilinear retrochoir or new building. Monastic buildings. Remains and ruins. Adjectives wanted. Too much the habit to hurl out several. Some are right! Mr. Sharpe singularly happy in his choice, his expressions *carefully shaded*. Really our language wants enriching in this direction. Ruskin always showing this need; though he never falls short or returns on his own traces, his method is too fantastical for soberer people. Some hours in the cathedral. The Rev. Mr. H——— (our chaplain, as we had called him)—an enthusiastic architectural antiquary, with double the years of most members of our party, and more than double the energy of the most youthful,—obliged to go now. Hand-shaking all round. May we meet again! Dinner at 3 p.m. Letter presented to Mr. Sharpe, and his health drunk in a glass of champagne. Three cheers and one more! "This letter and those cheers are all I could ask or wish from you. I feel the purpose of this excursion has been answered. We have had good weather, our arrangements have gone fairly. We have seen and sketched, and measured some good work." . . . . "It would have been a pleasure to me to have had a photograph of the party." Hint given, acted on at 5·30 p.m., at west front of Cathedral, all hold their breath and gaze into vacancy! . . . . "Our healths are improved, good humour keeps pace with good feeling and good digestion. No awkward or unmanageable man has dared to appear within our gay-hearted company!" . . . Farewell and *au revoir.*—To Newcastle, Liverpool, North Wales, North Staffordshire, and a full carriage to London.

ARCHÆO LOGICAL.

The Cardiff Corporation has invited the Royal Archæological Society to hold its next meeting in that town. It is hoped that the Marquis of Bute's patronage of archæology will induce the society to accept the offer.

The Old City Wall, Oxford.—Whilst workmen were engaged in digging for the foundations of the chapel for the Methodist Free Church last week, in New Inn Hall-street, Oxford, one of the bastions of the old city wall was laid bare. The wall is nearly five feet thick, and is in a capital state of preservation. The wall runs parallel with New Inn Hall-street, to S. Michael's Church, and so to Mr. Dudley's garden, where there is another but more perfect bastion. Part of the old ditch has been laid bare in the same excavations.

Roman Pavements.—Mr. H. S. Harland, F.R.A.I., of Sawden Park, near Scarborough, has just made known the discovery of important Roman remains at the village of Oldcoates, near Blyth, Notts, about four miles from Ranskill station on the Great Northern Railway. Mr. Harland says the discoveries deserve more attention from antiquaries than they are receiving. The pavements were discovered by a workman in digging a mortar-pit adjoining a new house in course of erection. The workman turned up part of the principal floor of a Roman villa, which has since been bared, and is found to consist of about 25 square yards of tesselated pavement, the tesseræ being about ⅝in. cube, of a brown and bluish colour on a white ground, the whole worked into an elaborate geometrical pattern, and having a rude representation of a (supposed) Roman warrior in the centre. This floor is about 1ft. 6in. below the natural surface. A second floor, supposed to be that of a bath-room, or hot-room, is still lower, and on the west, and is formed of tesseræ about ⅝in. cube, and all of white stone. This floor forms two sides of a square, and appears to have flues below it. At one part is a flagstone or hearth, and near it was charred wood. Trial pits have been dug in three other places, and from the quantity of broken tiles and pottery discovered, it seems the buildings have covered a considerable space as yet uninvestigated. During the three years in which the new Catholic church and buildings have been in hand near the spot, numerous tiles, as if for roofing, &c., have been dug up, with numbers of animal bones; but no human bones or coins have been found. It is believed that permission for a systematic examination of the whole area would easily be obtained by competent persons, and the remains ought to be carefully preserved.

Building Intelligence.

CHURCHES AND CHAPELS.

Alston.—The new church of S. Augustine, Alston, was opened on Tuesday last by the Bishop of Durham. The new edifice stands on almost exactly the same site as the old church, and while the foundations were being digged, the workmen discovered the foundation of the old eleventh century church, containing traces of elaborate decoration and carving. The present church is in the style of the thirteenth century, and consists of nave, south aisle, chancel, and transept, the latter forming the vestry and organ chamber. The gas-fittings are by Messrs. Combe and Son, Glasgow; and the warming apparatus by Messrs. Walker and Emley, of Newcastle. The church is not yet complete, the tower having only been raised to a height of 30ft. As funds will allow this will be increased to 55ft., and a spire of 60ft. high added. The total cost will be £3,600. Mr. J. W. Walton, M.R.I.B.A., London, is the architect, and Messrs. C. and J. Armstrong, of Carlisle, are the contractors. The church will accommodate about 420 worshippers.

Bolton.—The Congregational Church, S. George's-road, Bolton, was reopened on Sunday last, after undergoing extensive and thorough renovation at the hands of Mr. W. H. Lomas, of Strangeways, Manchester. The north gallery has been extended to the full length of the building, and the organ, which occupied a recess at the back of the pulpit, has now been removed to the north-west side of the gallery. An improved warming apparatus, on the hot-air principle, has been fitted up by Messrs. Constantine and Whittaker, of Bolton. The platform formerly used by the minister, has been replaced by a pulpit of Caen stone, which is elaborately carved and decorated with marble shafts and columns, by Mr. Cole, of York. The communion is enclosed, and is laid with a beautiful mosaic pavement by Messrs. Thomas Dale and Sons, of Manchester. The interior of the church has also been elaborately decorated. The total coast has been about £500.

Doncaster.—The ceremony of laying the memorial stones of the Wesleyan Methodist Chapel and day-schools, Oxford-place, Doncaster, took place on Tuesday, the 23rd ult. Mr. Wm. Watson, of Wakefield, is the architect, Mr. Harold Arnold, of Doncaster, being the contractor.

Fenton.—A chapel for the Methodist New Connexion was opened at Fenton on Wednesday evening last. The new edifice occupies the site of the old chapel, with the addition of some ground at the rear, from which some old buildings have been removed. It is in the Gothic style of architecture, and the total length, exclusive of the entrance, is 55ft. 6in., the width 40ft. 3in.; the height from ground line to the ridge is 51ft. The front gable, facing Market-street, contains the principal entrance, and has three wide doorways with moulded arches, and stone labels with carved terminals, supported by circular stone shafts, with circular moulded bases, bands, and richly carved caps, the whole surmounted by a large five-light stone window with tracery in the head. To the right and left of the entrance are staircases leading to the galleries and orchestra, the right staircase being surmounted with a tall, slated, spirelet roof, and the left staircase by a tower with buttressed angles and spire, the total height of which is 110ft. to the top of the metal finial with which it is to be crowned. There is a gallery around two sides and one end, with a circular enriched and moulded front. The school, which is at the further end of the chapel, is two stories high, entrances to which are from Park-street. The total length is 56ft. 6in., and the width 35ft. 6in. The rooms are divided into departments for boys and girls, with separate entrances, in which are a number of class-rooms. Portable partitions are fixed in the upper room, so as to be readily taken down in order to admit of the room being used as a lecture hall or for public meetings. The chapel will accommodate about 700, and the schools are sufficiently large for about the same number of children. The total cost has reached nearly £4,000. The architect is Mr. Pinchbeck, and the contractors are Messrs. Wade Brothers, all of Manchester.

King's Norton.—A committee of the parishioners of King's Norton has been appointed to collect funds for the restoration of the parish church. Mr. Hopkins, architect, of Worcester, has reported to the committee on the works necessary to be carried out. He recommends a thorough restoration, at a cost of £2,500, of the whole fabric of the tower and spire, including the removal of all decayed stones and the substitution of fresh ones; the restoration of the parapet; the removal of the incongruous gables; and the rebuilding of part of the north aisle.

Locking.—The parish church of Locking, Somersetshire, was re-opened on Sunday week, after various additions and improvements, from the plans of Mr. E. Down, architect. Mr. Stradling, jun., of Weston-super-Mare, was the contractor.

Mylor.—The Bishop of Exeter re-opened Mylor Church, Cornwall, last week, after restoration at the hands of the Rev. J. Murray, the vicar, who has been his own architect, "and has aimed at restoration in the strict sense of that much-abused term." The cost has been upwards of £1,100. The reredos is to be filled with Salviati's mosaic work.

North Ormesby.—On Wednesday week the foundation stone of a new mortuary chapel, to be erected at the west end of the hospital, was laid. The chapel is from designs by Mr. E. Tidman, and the contract has been let to Mr. Aaron Lackenby.

Westhoughton.—On the 24th ult., the church of S. Bartholomew, Westhoughton, near Bolton, which has been re-erected by Mr. John Seddon, at a cost of about £6,000, was consecrated by the Bishop of Manchester. The building was designed by Messrs. Cunliffe and Freeman, architects, and is capable of accommodating 831 persons. The east window, by Clayton and Bell, has been erected by the parishioners, in commemoration of the munificence of Mr. Seddon. Its cost was about £300.

Winkleigh.—On Sunday week the parish church of Winkleigh, North Devon, was re-opened, the chancel, with the arch and wall of the nave adjoining, having been partially re-built and restored. Collections were made to form a fund for the restoration of the rest of the church. The work has been executed by the Messrs. Hooper, of Hatherleigh, under the designs of Mr. Christian, to whose report it is, indeed, owing that the Ecclesiastical Commissioners consented to restore the chancel.

BUILDINGS.

Barnard Castle.—Building is going on at Barnard Castle at the present time with more vigour than for many years past. The Duke of Cleveland has lately agreed to dispose of a portion of land in the Flatts for building purposes, and a line of road has been laid out for the formation of a new street, extending from the Horse Market northwards over the higher side of the Corn Close; and, in fact, forming a continuation of the Horse Market. The contract for the construction of a foot-bridge across the River Tees has been accepted by a Darlington firm.

Bath.—An important improvement is now being effected in the Corridor, Bath, by the construction of a new roof, which will be of iron and glass, the central division being angular, and the end divisions in the shape of a dome. The entrances will each be emphasised by a couple of granite pillars. The alterations are being carried out from the designs of Mr. Goodridge, architect, the contracters being Mr. Francis for the glass work, and Messrs. Sothern and Pitt for the iron and other work.

Bradford. — On Saturday last the corner stone of the new schools in connection with S. Thomas's Church, Cropper-lane, Bradford, was laid by Mrs. F. S. Powell. The schools, which are to accommodate 730 boys, girls, and infants, have been designed by Messrs. Lockwood and Mawson, architects, Bradford, in the Gothic style, and are being erected by Messrs. J. Ives & Son, Shipley. The cost, including the value of the site, will be £3,300.

Cardiff.—At the weekly meeting of the Cardiff Board of Guardians on Saturday last, Mr. Stephens, architect, having completed the alterations required by the Poor Law Board in the plans for the new workhouse, now produced them, and also an amended estimate for bread-room and tramps' block, receiving rooms, &c., amounting to £7,675, an excess of £1,200 on the former estimate. The plans, as amended, were accepted by the Guardians, and are again to be sent to London for the approval of the Poor Law Board.

Edinburgh.—It is now upwards of six years ago since the first stones of the Fettes College, Edinburgh, were laid. We gave an illustration and description of the building at the time (see Building News, Vol. XI., p. 540), and need only say here that the work is now nearly completed. Mr. David Bryce, R.S.A., is the architect. The cost up to the present has been £140,000, and it is estimated that the total cost will be £150,000.

Pickwell.—Extensive works, in addition to and restoration of the Manor House, are being carried out in this village. The works are being executed by Messrs. Halliday and Cave, of Oakham, under the superintendence of Mr. R. W. Johnson, architect, of Melton Mowbray.

Stockport.—At Stockport a new mechanics' institute is being built in Hazel Grove, by Mr. Mr. S. Howard, of Disley, from the designs of his son, Mr. S. Howard, jun. The building is of brick with stone and white brick dressings. The cost is to be over £1,000.

Wakefield.—On Tuesday last the foundation or corner stone of a new school-church was laid at Belle Vue, near Wakefield, in the parish of Sandal Magna, by Mrs. Holdsworth. The new edifice will be situated in a field abutting on the Doncaster-road. The estimated cost is about £1,500. The style will be Gothic. The architect is Mr. Jeckyll, of London.

◆

TO CORRESPONDENTS.

To Our Readers.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office not later than 5 p.m on Thursday.

Received.—J. D., J. B. F., J. B. and Co., W. and D. P., S. Son and R., W. Warn., W. J. C., T. C. W., J. B. R., J. S., R. M. S., T. H. R.

Jas. Redford.—See Building News, August 12.

R. A. M., Birmingham.—Sketch returned.

W. Y.—The stamps were sent.

D. M.—An American publication.

A. S. Bird.—Instructions forwarded.

Savory and Co.—The parcel came to hand.

S. S. and R.—Photos to hand.

Correspondence.

ANCIENT CROSS.

(*To the Editor of the* Building News.)

Sir,—Your new correspondent, also, is equally silent about the inscription. Will no charitable individual, who has access to the original, enable us to decide upon the letters and language used?

Llantwit Major, in Glamorganshire, the site of the first Christian school of learning in Britain, is one of our most interesting localities; an older Christian settlement than Canterbury itself, and of unequivocal authenticity. Visitors report the existence there of a fragmentary cross to commemorate the founder, S. Iltyd or Iltutus, *circa* 408-502 A.D. Llan-Iltyd has been corrupted to Llantwit; it was, so report says, erected by his pupil and next successor but one, Samson, Archbishop of Dol. A. H.

August 26th, 1870.

ARCHITECTS' CHARGES.

Sir,—Can you or any of your readers enlighten me on the following? I have prepared three sets of designs for detached villas, with a map of the ground showing position of houses, with a preliminary estimate of cost and all particulars; in short, everything which would be necessary to ask builders to estimate. My client being the freeholder of the property, he now informs me that he only wants them to show future lessees what he intends to have built on the property. For the sake of peace I have offered to take 2½ per cent., with the additional understanding that he will not infringe the copyright of the designs. He refuses to comply with either of these offers, and returns me my bill, but not the drawings. As this is not an isolated case, but one of several I have met with in the same district, I shall be glad to know what the law will allow me to charge. It is becoming very much the fashion for men who can well afford to pay to get designs in this way, and then, by bombast and threat, to say they will stand out a lawsuit, and endeavour thereby to blink payment of the same; and in many instances do so, unless the poor architect accepts as a compromise an amount in many instances which barely reaches to mechanics' wages. I should be sorry, further, in this instance to concede anything which might prove an injury to the profession at large, or which, as a young beginner, may be detrimental to my future success.—I am, Sir, &c.,

Young Architect.

WHICH IS THE GROUND STORY OF A HOUSE?

Sir,—Will you kindly allow me to thank the gentlemen who wrote me on the above, all of whom concurred in my view? The case came on before Mr. Dayman, on Friday last, who, before the hearing commenced, intimated that the decision would be against me. During the hearing I drew his Worship's attention to the 23rd section of the Building Act, which refers to underground rooms, and read to him the written opinions of various London and provincial architects. Subsequently the Magistrate contended that I was in error in using the term "floor," and applying to it the same significance as "story," the term used in the Building Act. Mr. Marrable attended to give evidence in support of my view; but was not heard. The case was adjourned to the 7th of October, his Worship having consented to consult the 23rd section, and read the letters. Kindly allow me to inform those gentlemen who wrote me that it is my intention to send a written acknowledgment to each on the letters being returned. Thanking you for your courtesy, —I am, &c. T. E. Knightley,

District Surveyor for Hammersmith.

WINDOW CLEANING.

Sir,—Amongst the numerous inventions applicable to the saving of labour there has not yet appeared one —which is a real necessity—for sparing the lives of women servants. The article needed is a wooden hand and arm, to hold a cloth and move to clean the outside panes of glass in bedroom windows. In the country women servants constantly do this, and sit on the sill holding by the window frame, with the body outside. Can it be difficult to arrange an instrument to work upwards, downwards, and to the right and left, so as to clean the glass and spare the risk of life and limb by the common act of the neat tidy housemaid? The inventor would find remuneration. Every mistress would rejoice to possess what would do the work and spare her from anxiety. Tidy servants never will take warning or obey if ordered not to sit outside of the window.—I am, &c., Isle of Wight.

August 30.

QUESTIONS.

[1931] MEASURING BUILDERS' WORK.—Can any reader inform me of a good and inexpensive book giving directions for measuring the various kinds of builders' work? I have Peddie's, but that does not enter into the subject sufficiently.—G. W. W.

[1932] SKETCHING IN TOWER OF LONDON. — I should be glad if some of your readers could inform me by what means I could get an order for sketching in Tower of London.—A. C.

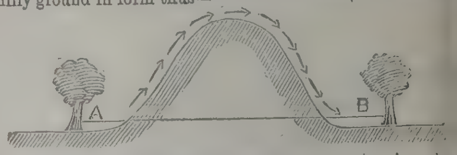
[1933] WHITWORTH SCHOLARSHIPS.—Will some one inform me where I can procure a copy of the examination papers issued to the competitors for the Whitworth scholarships last year? Also where I shall be able to obtain the requisite information regarding the examination to take place next year?—T.

[1934] MALT-HOUSE FLOOR.—Would any correspondent kindly inform me what are the proper materials, and the proportions of the same, to make a thoroughly good malt-house floor?—Pecksniff.

[1935.] GOTHIC ARCHITECTURE.—Will any of your readers inform me of a good book for the study of church architecture, likewise one on Gothic architecture generally, say 13th to 15th century?—Anxious Youth.

[1936] ROAD-MAKING.—Can you or your readers inform me of a good work on road-making and draining of the same, with name of the publisher?—W. P. B.

[1937] MEASURING HILLY GROUND.—I wish to ascertain how the measurements of hilly ground were taken by the persons appointed to make the Tithe-Map and Ordnance Survey. For instance, I purchase a piece of hilly ground in form thus—

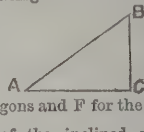


It is sold to me according to the measurements given in the book of contents attached to the Tithe-Map. Are the dimensions taken horizontally, A, B, in order to compute the contents, or, on the other hand, are the dimensions taken on the surface only, as indicated by the arrows.—Subscriber.

REPLIES.

[1913] RETAINING WALLS.—The drawing shows the proper manner in which to lay out the plan of the wall; but it must be borne in mind that the backs of the counterforts or buttresses should not be curved, but laid out at a tangent to the radius of the large circle. This arrangement will simplify the work, and also slightly increase the strength of the wall. The distance between the buttresses should not exceed 15ft., and their breadth or depth, which should be equal to one another, may be obtained by the following simple formula. Let H be the height of the wall, T the thickness at top, and R the ratio of the latter. Putting T^1 for the lateral dimensions of the counterforts, we have $T^1 = T + \frac{RH}{2}$. If any steps are built on the back of the wall, there should also be corresponding ones in the counterforts.—A. M.

[1914] SELF-WORKING GRADIENT. — The first thing to do with respect to this question is to find what



weight would draw the empty waggons up the incline. In the cut, let BAC be the angle of elevation of the incline, let P equal the weight or force necessary to draw up the empty waggons Put W for the weight of the empty waggons and F for the value of friction. Then, by the principle of the inclined plane $\frac{P = W \times BC + F \times AB.}{AB} = \frac{W \times BC}{AB} + F$. But $\frac{BC}{AB}$ equals the sine of angle BAC, equals the sine of angle elevation, so that $P = W \times$ sine BAC + F. Any value will therefore obviously answer for the angle BAC that does not make the value of I greater than the weight of the full waggons. It must no be forgotten that ample allowance must be made for the friction, and also for the want of adhesion in wet weather —Axle.

[1915] EVAPORATION.—The loss of water which i available for the supply of a town, by evaporation, depend upon so many circumstances that it is scarcely possible t reduce it to a general rule. The nature of the subsoil o the gathering grounds and catchment basins very materially affects this result, so much so, that it is difficult t asertain what quantity is lost by evaporation, and wha by percolation. The best way to arrive at an accurate conclusion is to make a short series of experiments in th district in which the intended waterworks are to be erected —Locus.

[1916] FLOORS.—For the information of "Apprentice I give in the accompanying sketch examples of ordinary single and double flooring. In fig. 1, W is the wall plate

FIG. 1

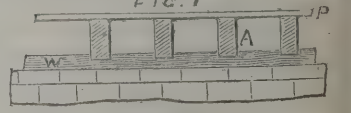


FIG. 2

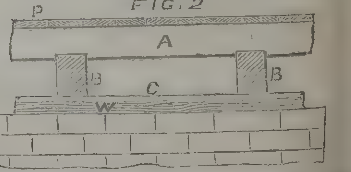

A the joists, and P the floor boards. In fig. 2 the corr sponding letters represent the same parts; but it wi seen that there are additional joists, B, which are called binders, and which carry the ceiling joists C. Double floors are much stiffer than single ones, and ought to be employed more frequently than they are. But builders and landlords will not pay for extra joists, although they assist in binding the whole building together in a manner which very much contributes to its durability and soundness. A great many cases of failure houses, are owing to the wretched shaky floors laid down which communicate to the walls continual vibrations and shocks. – S. L. B.

[1916] FLOORS.—Single floors are those in which the joists reach from wall to wall; the lower edges of the joists receive the lathings and plasterings of the ceilings, as in fig. 1. Double floors are constructed with stout binding joists placed about 12ft. apart, which support bridging joists for floor and ceiling joists for the ceiling, as in fig. 2.—A. C. Pillar.

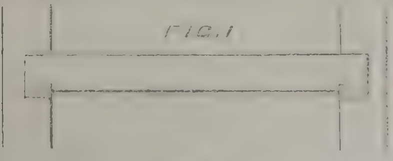

FIG. 1

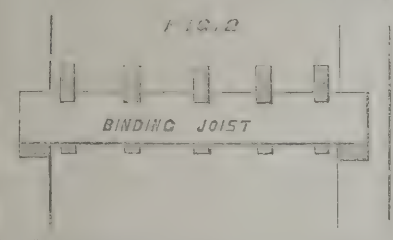

FIG. 2

[1918] STRENGTH OF TIMBER.—In Weale's "Rudiments of the Art of Building," (page 84, article 178), is the following formula for the strength of a beam, in which (*s*) is the transverse strength of the material, (*b*) the breadth, (*d*) the depth, (*l*) the length between the support, and (*w*) the breaking weight. $w = \frac{s\ b\ d^2}{l} = \frac{400 \times 5 \times 13_2}{21} = 16095{\cdot}238$lbs. The above result is the breaking weight of one beam. The beams being set 13in. apart it takes four beams to carry a square of flooring. Multiplying the above result by 4 we get 64380·952 as the breaking weight in pounds of the four beams. But as the safe load to place on a beam should never exceed one-third of the breaking strain, dividing the last result by 3 we obtain 21460·317 as the load which can be carried with safety by the floor, which is a little over 9½ tons per square. Perhaps the annexed extract from the same volume may be of service to "Founder," (1928). At page 88, article 182, the author says:—"In practice it is not desirable to load iron girders beyond one-third of their ultimate strength, and they should be proved before use by loading them to this extent or a little more, but care should be taken never to let the proof exceed one-half the breaking weight, as a greater load than this strains and distresses the metal, making it permanently weaker. The ultimate strength of a girder of the usual proportions may be approximately ascertained from its deflection under proof, on the assumption that a load equal to half the breaking weight will cause a deflection of 1-480th of its length.—Studiora."

[1919.] SMOKY CHIMNEYS.—There are a quantity of superstitions in regard to smoky chimneys; I cannot see that the hole in the chimney would have the desired effect, if you have the down draught from the topmost part you have the same from the hole. If you want currents of air, you must commence from the bottom part, and then you must have your current of cold air to drive your hot air very strong in force to compete with the heavy and foggy atmospheres. But this is no cure for "S. R.'s" chimney. If you want to get at curing smoky chimneys, you must first of all get hold of the disease and then you can apply the proper remedy.—A Chimney Doctor.

[1922.] ARCHITECTS' ASSISTANTS' HOLIDAYS.—All depends upon the agreement. If an assistant engages himself unconditionally at a certain rate per week, "Constant Reader" need not put on his considering-cap to enable him to arrive at the conclusion, that for every week's pay he must work every day. If, however, he is called upon, as in some offices, to render extra services without a fair compensation for the same by his employer, it would be only just to expect a proportionate holiday without any stoppage of wage. It cases of yearly engagement a holiday is generally provided for by a condition in the agreement.—Tee Square.

[1925.] SEWAGE IRRIGATION.—There is at present great diversity of opinion among those experienced in the subject as to what is the proper number of acres of land to take for a given population. Mr. William Hope says that towns with increasing populations to utilise their sewage should purchase one acre for every twenty or twenty-five persons; if stationary, one acre to every forty or forty-five persons, for this latter proportion represents as much sewage as land can either utilise or purify over a term of years. Mr. Baldwin Latham says the sewage of 100 persons may very well be applied to one acre of land. The light loam land is more suitable for sewage irrigation. —A. J. C.

◆

LAND AND BUILDING SOCIETY.

Westward Ho! Villas Company.—The annual meeting of this company was held on Wednesday week at Bideford. The report stated that there was a reserve fund of £1,469, and recommended that the payment of a dividend of 3 per cent. An amendment that no dividend be paid was carried by a large majority.

LEGAL INTELLIGENCE.

Samuel Trickett v. Wedekind.—This was an action in the Lord Mayor's Court for the recovery of the value of a quantity of stone supplied to the defendant. The plaintiff is a stone merchant, carrying on business in Gresham-buildings, and owning extensive quarries near Leeds, and on July 29 last he received an order from the defendant for 500ft. of 2-inch paving stone, at price as per original agreement, which would be 6½d. per foot. The stone was intended for shipment to Hamburgh. On August 3 he received a note from the defendant cancelling the previous order, in consequence of the price for squaring the stone being more than the Hamburgh customer would give. Immediately plaintiff wrote off to his brother, who managed the business at the Leeds quarries, telling him to cancel the order; but his note did not reach its destination until the order had been carried out, and the stone had been already sent to Hull for shipment to Hamburgh. The stone was never returned to plaintiff, and no claim was ever made on him for freight of the goods. A verdict nonsuiting the plaintiff was entered, with power to Mr. Kemp to move the Exchequer Court for a new trial on the ground of misdirection.

Claim for Supply of Cement.—James Wright, proprietor of lime and cement works at Hitchin, Bedfordshire, sued Henry Reddy in the Lord Mayor's Court last week to recover £11 18s., the price of eight tons, containing 110 bags of cement supplied to him so long ago as 1868. The goods were invoiced to Messrs. Chichester Brothers; and the plaintiff, in reply to the Judge, said that a messenger came to their establishment and gave the order for the goods. Defendant did not give the order, and disputed his indebtedness on the ground that the cement was not good in quality. The defendant had the goods sent to his place at Beckenham, in Kent. After an action had been taken against Messrs. Chichester it was discovered that they had never ordered the goods, and they found a letter from Mr. Reddy which he wrote to Mr. Wright, stating that the cement the plaintiff had sent to Beckenham. Messrs. Chichester, of this place, were applied to for payment, and their reply was that Reddy was erecting some buildings on their property, and that it was he who had received the cement. Mr. Reddy, who conducted his own case, denied that he ever ordered the cement or used it. He knew nothing at all of the transaction. Verdict for the plaintiff.

Joiners' Case.—At the Edinburgh Small Debt Court, on Friday last, a case of some interest to joiners was disposed of by Sheriff Hallard. Robert Watson, joiner, Dalry Park-terrace, sued William Brown, house carpenter, Charlotte Square-lane, for 8s. 6d., which he alleged to be due to him for work done for the defender on 16th and 17th June. The defence was that the pursuer left his employment without giving warning; and that this was contrary to the practice of the trade. Several witnesses were called, who spoke as to the rule of the trade regarding warning. Their depositions were to the effect that, after getting his first pay, a workman was entitled to receive from his master, and to give to him, a week's warning, in the event of either party being dissatisfied; but that before getting his first pay a workman could leave or be dismissed without that notice. The sheriff held it proved that up to the first pay master and servant were upon mutual trial; and that if the employer thought the workman incompetent, or if the workman considered the employer severe or disagreeable, they could part company without warning. He found for the pursuer, with expenses.

◆

WATER SUPPLY AND SANITARY MATTERS.

Banbury.—The *Bicester Herald* states that on the Banbury Board of Health Farm a little over six acres of rye grass, grown under the influence of the refuse of the town, sold for £57 10s., or at an average of £9 10s. 6d. an acre. This does not seem very much money in comparison with the sums realized off sewage meadows in the vicinity of Edinburgh, where at the rate of from £30 to £40 an acre is often, indeed, it may be said, annually, realised. But the amount signifies little comparatively. That which is gratifying in the paragraph is the fact that loathsome and poisonous matters have been robbed of their noxiousness, and made profitable to the community. Besides the rye grass, there were raised on the farm sixteen acres of oats, which at a public sale were sold at an average of £16 per acre.

Hornsey.—The Hornsey Local Board of Health has at length, and after much negotiation, succeeded in making arrangements with the Board of Works for the sewage of Hornsey, which now flows into the River Lea, to be carried into the northern high level sewer.

Merthyr.—The Merthyr Local Board of Health having obtained their Bill for carrying out their surveyor's proposed scheme of irrigation, steps will be immediately taken to borrow a sufficient sum for carrying out the same; something like £30,000 will be required.

Neath.—The Neath Sewers Committee have accepted the tender of Mr. Cribb for the new drainage works proposed to be carried out in that town.

Newent.—The question of dealing with the sewage of this town and district is at length virtually settled. A committee has been unanimously agreed to by a very large meeting, duly convened by legal notice last week. The whole parish is to be formed into a drainage district.

Ottery S. Mary.—The Ottery S. Mary Local Board have determined, on the strong representation of the inhabitants, to give a better water supply to the upper part of the town, and Mr. Norrington, the surveyor to the board, is entrusted with the survey, estimates, &c.

Purification of the Rivers Aire and Calder.—On Tuesday a conference of the representatives of local authorities of towns on the rivers Aire and Calder was held at Leeds, "for the purpose of considering what measures it is most advisable to adopt for the purpose of enforcing the purification of the rivers Aire and Calder, and the suspension of legal proceedings for a sufficient period to effect the necessary measures for doing so." It was resolved "That inasmuch as the Government have not taken any measure for the general conservancy of the rivers Aire and Calder, and great pressure having been put on the local authorities in the watersheds of those rivers by proceedings in Chancery and otherwise, this meeting is of opinion that some measure should be introduced into Parliament in the ensuing session on behalf of the local authorities of all the boroughs and districts within the watersheds of the Aire and Calder, to deal with the whole question of defecating the sewage of such places, and of purifying the streams and rivers of those watersheds, due regard being had to the important manufacturing and other interests thereby affected." It was also resolved, "That a committee be appointed to consider and report as to the best mode of giving effect to the preceding resolution, and that this meeting be adjourned to the 8th October to receive their report."

Reigate.—Considerable progress has been made with the irrigation works for the Reigate sewage. Mr. Baldwin Latham is the engineer for the works, and in his last report to the Reigate Town Council says that great progress has been made in preparing Earlswood Common for the reception of the sewage of the district, and with the erection of buildings and sewage extractors. Work to the value of £1,650 has been done, and Mr. Latham has certified for £1,310 to be paid to Mr. Hayward, the contractor. The sanitary committee have approved the designs of Mr. Latham for the outfall sewers, and have directed application to be made to the Secretary of State for his consent to borrow £13,000 to carry out the works.

Taunton.—The Taunton Board of Health is in a "fix." The whole of the sewage discharges into the Tone, and for a mile in length the river has the appearance of an elongated cesspool. Various plans have been discussed for deodorising the sewage to make profitable manure, but hitherto nothing has been done. The affair culminated on Thursday week, when Captain Beadon (who owns the fishery of the river, and has houses on its bounds) gave notice that unless the Board remedies the nuisance within a fortnight he will apply to the Court of Chancery for an injunction to restrain the Board from sending any sewage into the river.

The London Water Supply.—Mr. Ormsby, C.E., has written a long letter to a daily contemporary respecting the water supply of London. He points out that although there is plenty of water for common use in London, the source from which that supply is derived is so corrupted with unavoidable filth as to make it unfit for human consumption; and it is therefore necessary to overcome this difficulty by the discovery of an analytically-pure source of supply. It appears that 100,000,000 gallons of water are consumed daily for all purposes, and, as the utmost that is required for drinking and cooking is 6,000,000 gallons per day, it is evident that if all the water that is used in London is to be filtered, it will be necessary to filter 94,000,000 gallons per diem more than is required, as well as to commit the absurdity of applying this filtered water to the purpose of flushing sewers, serving water-closets, watering streets, &c. Mr. Ormsby discusses at great length the report of the Royal Commissioners on this subject, and advocates the adoption of the Salisbury Plain project, believing it to be the best that can be adopted.

Lord Derby on Sanitary Reform.—Lord Derby last week laid the foundation stone of a new hospital at the rising town of Bootle and in an admirable speech dwelt on the, to a great extent, preventible causes which necessitated the establishment of such institutions. Among such causes he prominently classed our sanitary deficiencies. "In sanitary matters, at least," said the noble lord, "the future of the world need not be like its past; for the worst of the material evils that beset us, the cause is not in the arrangements of nature, but in ourselves; and remembering that this is the age of great towns, and knowing what are, in a sanitary and moral point of view, the defects and the difficulties of great towns; and bearing in mind, what I am afraid there is no doubt of, that an urban population not recruited from the country cannot keep life permanently in itself, but tends inevitably to decay and die out—considering all these things, I say, you will be at no loss to see what our business is, and to some extent to see how it is to be done. We want here broad streets, good drainage, plenty of light and plenty of air. These are the first requirements, and for so much I will undertake to answer, so far as my interest in Bootle is concerned. But we want more. We want good and cleanly houses for our working men: we want baths and washhouses; we want places of healthy exercise for those whose labour is sedentary; we want places of rest and harmless amusement for all when their labour is done These things must be everybody's concern; and as Bootle is about the youngest borough in England, I hope it will do what youth always thinks it can do—show itself a great deal wiser and more energetic than its elders. One thing we have to remember—in theory we all know it, but in practice we are too apt to forget it—that the true wealth of a state is not shown in the lists of its exports and imports, nor in a vast revenue easily raised, nor in its enormous yearly savings, of which our statistical writers boast. All these things are excellent in their way; but excellent as they are, they are means, not ends; and the end of them all is, that we should have living on this English soil a population not squalid in dirt, not decimated by disease, but healthy in body and mind, trained for all needful purposes, whether of peace or war, living in homes which make self-respect possible, and attached to a country which has done its duty towards them." If every wealthy landlord laid to heart (as Lord Derby has done) the maxim that wealth has its duties as well as its privileges, what might not be effected in the way of social reform? Class feelings would no longer rankle in the breasts of working men, nor would the upper classes be contemptuously spoken of as "a bloated aristocracy."

◆

STAINED GLASS.

Barnard Castle.—A stained glass window has just been placed in the south transept of the parish church of Barnard Castle to the memory of the late Canon Dugard, vicar. The subjects of the window are "Christ giving his charge to Peter," and the "Good Samaritan." The work is by Mr. Baguley, of Pilgrim-street, Newcastle-upon-Tyne.

Steyning.—The west window of the fine old church at Steyning, Sussex, has just been filled with stained glass, erected as a memorial to the late Dr. Ingram. The design of the stonework, an Early English window of two lights with quatrefoil head well proportioned to the massive tower in which it is placed, is the work of Mr. Gordon Hills, Messrs. Hardman being intrusted with the design in stained glass, which consists of two large-sized medallions containing subjects in rich colours set in a ground of grisaille glass with coloured borders. The subjects illustrated are "Christ blessing little Children," and "The Good Samaritan."

◆

STATUES, MEMORIALS, ETC.

Edinburgh.—The Prince Consort Memorial, Edinburgh, is now, so far at least as the sculptor is concerned, approaching completion. The design selected for the memorial was one of three submitted in public competition by Mr. John Steell, R.S.A. It consists of what may be generally described as a great pedestal, supporting a colossal equestrian statue of the Prince, and itself enriched with bas-reliefs and subsidiary groups of statuary. The structure, oblong in ground plan, is formed in three stages. The first of these, which presents faces of plain masonry about 4ft. in height, has at each angle a square projection, designed to support a group of figures. Over this rises the second stage, which is to have its sides covered with quotations from Prince Albert's published speeches. The third stage, or pedestal proper, is richly moulded, and exhibits on each side a bas-relief in bronze illustrative of the Prince's tastes, or of leading events in his life. Under the centre of each bas-relief a group of emblematic objects, suggestive of the Prince's honours and pursuits, will rest on the ledge formed by the projection of the second stage beyond the base of the third. The groups of statuary for which places are provided on the first stage are designed to represent people of all classes in the act of approaching the Prince with looks and gestures of reverence and affection. In accordance with Mr. Steell's wish, the execution of these subsidiary groups was entrusted to other Edinburgh sculptors. That representing the Aristocracy was undertaken by Mr. Brodie. The figures standing for the Army and Navy were assigned to Mr. Clark Stanton. The late Mr. M'Callum took the group representing Labour; but after accomplishing the greater part of his task, left it to be finished by Mr. Stevenson, who had also allotted to him the figures intended to denote Science and Literature. Of the four groups, only the one last mentioned now remains to be completed, and that we (*Scotsman*) believe, is nearly ready for casting. Some delay has taken place in respect to the pedestal, in consequence of the resolution adopted about a year ago to substitute Peterhead granite for freestone. This granite will be supplied by Messrs. McDonald and Leslie, Aberdeen. It will, however, require nearly twelve months to execute the commission for granite work after the order shall have been given.

Loughborough.—A new drinking fountain, the gift of the Ven. Archdeacon Fearon, is in course of erection in the Market-place, Loughborough, by Mr. Hall.

◆

Our Office Table.

The South London Tramways.—The following is the method adopted in the construction of the tramways of South London :—A trench is first dug in the centre of the public carriage-way, ten feet broad and two feet deep. The bed is paved with old bricks closely packed together, and covered with concrete one foot six inches in thickness. Upon the solid mass are placed iron shoes four feet apart, which receive quarterings of yellow deal, six inches deep, four inches broad, and twelve feet in length. These are kept five feet apart by iron bars, which drop transversely into sockets prepared for their reception in the shoes. Upon the quarterings are laid the iron tramway, four inches in breadth, in which is a groove to receive the small wheels, by which the carriage wheels are regulated. The inner half of these trams is corrugated, and affords a bite for the revolving wheels. The interstices are filled in by blocks of granite six inches square, set in with concrete, and which, when complete, form a level and compact road of great durability.

Science and Art Department.—The results of the late examinations in drawing held by the Science and Art Department are as follows :—As respects schools for the children of the labouring poor—In 1,376 schools examined, 98,544 children and pupil-teachers worked 114,964 exercises, being an increase on the numbers examined in 1869 of 282 schools, 16,093 children and pupil-teachers, and 19,750 exercises. As respects schools of art and art night classes—In 394 schools examined, 16,361 students worked 24,370 second grade exercises ; an increase of 91 schools, 3,587 students, and 4,330 papers. From 347 schools of art, night classes, and science classes ,13,660 students submitted to the Department for examination 90,889 drawings, executed in the ordinary course of the year's study, being an increase of 126 schools and classes, 3,735 students, and 25,440 drawings. In 1869, 75 candidates were examined for the third grade, or art master's certificate. These worked 302 exercises, and 25 candidates were successful. In February last 78 candidates, who worked 316 exercises, were examined, and 27 succeeded in obtaining the certificate. Finally, the total number of schools examined in drawing this year is 1,842, and of candidates 128,643, by whom 230,269 works and exercises were executed ; showing a total increase in twelve months of 404 schools examined, 23,418 candidates, and 49,534 works and exercises. In the last three years there has been a total increase of 1,146 schools, 76,412 candidates examined, and 160,867 worked exercises.

Thames Embankment (North) Approaches.—Useful and necessary as it may be to open communications between the streets running south from the Strand to the Victoria Embankment, we (*Globe*) are unable to join in the opinion that this improvement would bring the magnificent carriage-way by the Thames into use, and relieve the Strand. The necessity is a broad road branching obliquely from the neighbourhood of Charing Cross to the Embankment. Such a way might be opened from the eastern extremity of the Charing Cross railway station, nearly in the line from the upper side of Trafalgar-square (by the side of S. Martin's church) to the Strand. The property to be taken on the south of the Strand is not of great value, and does not include the destruction of any public building of great importance. [Our contemporary does not take cognisance of the fact that it is at the *east*, and not at the west end of the Embankment that an approach is wanted to render it available for much traffic. That approach (viz., the new street from the Mansion House) is in course of construction, and will be the main feeder of traffic to the Embankment. To make the approach what it should be at Charing Cross, a roadway should be constructed directly opposite the Nelson column, but this would necessitate the complete or partial demolition of Northumberland House. As it is, we think that the continuation of Whitehall-place to the Embankment will afford a tolerably direct outlet from the Embankment to Charing Cross, though not so good a one as that suggested by the *Globe*. But however complete the western approaches may be made, comparatively little traffic will run along the Embankment until the City approach is completed.]

Alleged Oil-Spring in London.—At the last meeting of the Hackney District Board of Works, Dr. Tripe, the medical officer of the district, reported that he had visited a factory belonging to a Mr. Barnes, at Hackney-wick, where there was a furnace fitted up for burning "dead oil"—that is to say, an oil which is given off during the latter stages of the distillation of gas-tar. The The oil, however, burnt at Mr. Barnes's works he discovered was not "dead oil," but a similar product, which is pumped with water from a deep well in the factory, and resembled impure rock-oil. He believed it was the only instance of a natural oil-spring in England.

Dover Harbour.—The Dover Harbour Board intend to deepen the harbour, and improve the vessel accommodation, at a cost of £80,000. Messrs. Lee & Sons, the contractors for the Admiralty Pier, have been making the necessary surveys, with the view of obtaining the order for executing the work.

Fall of Buildings at Manchester and Jarrow.—About 9 o'clock on Monday morning, the greater portion of two houses and shops in Market-street, Manchester, fell. Some time ago the premises were condemned by the City Surveyor as insecure, in consequence of which the owner had commenced making alterations. The front wall of the upper stories had been removed, and the owner's intention was to replace the shop windows. From some cause the whole of the front floors, from roof to basement, gave way on Monday. Fortunately no workman were engaged about the building at the time of the accident. Later in the afternoon another portion of the premises fell. On the same day, two large chimneys at the west end of the chemical works lately occupied by Mr. T. J. Nixon, of Jarrow, suddenly fell down with a loud crash, and carried with them the entire ends of two large sheds, considerable portions of the roofs, and several yards length of the boundary wall. Fortunately, there were no persons in the vicinity at the time.

◆

Chips.

The new theatre in the Strand (described in last week's Building News) is to be named the "Opera Comique."

The church of S. Ethelburga, Bishopsgate-street, is closed for further "restoration."

The church of S. Michael, Cornhill, will be closed for two Sundays, to allow of the construction of ventilators and other works.

The foundation stone of the new music hall at Sheffield was laid yesterday (Thursday).

Mr. Ernest Hart, well known as a sanitary reformer, has been appointed editor of the *British Medical Journal.*

Another race-stand accident took place at Leicester, on Monday week, and several people were severely injured.

Great alterations and additions are to be made to Zion chapel, Boston. Messrs. Broughton and Sherwin's contract has been accepted for the proposed works.

The Corn Exchange, Lincoln, has recently been repainted and decorated by Messrs. Morgan and Waller.

A local journal says that the lowest tender for the erection of the new church of S. Martin, Lincoln, is £2,000 above the architect's estimate. The committee intend to fall back on the other plans from which they originally selected.

The new Corn Exchange at Chatteris was opened on the 19th ult.

The Rochester and Chatham Gas Company have resolved to reduce the price of gas supplied by them from 4s. to 3s. 6d. per thousand feet at the end of the year.

A new organ (by Messrs. Walker and Sons, of London) has just been placed in Feering parish church, Essex, at a cost of £350.

The enlargement of S. Peter's Church, Folkestone, is so far accomplished that the building was reopened yesterday (Thursday).

On Tuesday last the memorial stones of a new Primitive Methodist chapel were laid at Derby The total outlay will be £4,000.

A new Protestant church at Killarney was consecrated last week.

A street tramway from the Liverpool Exchange to Spellow-lane, Walton, was opened yesterday (Thursday).

A great number of buildings are at present in course of demolition at Liverpool, to make room for the new station for the Manchester and Sheffield, Great Northern, and Midland Railways.

The foundation stone of a new Wesleyan chape was laid on Tuesday last at Coxhoe.

Mr. Joseph Dodds, M.P., on Tuesday last laid the foundation stone of a Sunday school for the Cleveland Wesleyan chapel, South Stockton.

The building of the art schools which are to be erected in connection with the London University College, in conformity with the provisions of the Slade bequest, is to be proceeded with without delay.

At a meeting of the gas consumers of Market Drayton, held last week, it was resolved, "That the Market Drayton Gas Company be solicited to reduce the price of gas to 4s. 6d. per thousand feet, and should they refuse, this meeting pledges itself to discontinue the use of their gas at Michaelmas next."

Mr. Rollaston has been re-elected surveyor to the Assessment Committee of the West Bromwich Board of Guardians, at a salary of £90 per annum.

The buildings of the Newcastle Improved Dwellings Company (Limited), near the New-road, are now rapidly approaching completion, and it is stated that the applications for tenancies from every grade of the working classes are already very numerous.

From Canada we learn that extensive fires have been raging in the woods around Ottawa.

The parishioners of Speen, Berks, are about to rebuild the tower of their church, at a cost of £1,200.

There is a talk of making Leicester-square a flower market. A more desirable change could not take place; and Covent-garden, which has long suffered from repletion under a badly arranged system, would find no little benefit from such an establishment as is now proposed.

A circular letter has been addressed to the Lords Lieutenants of counties, asking them to obtain for the International Exhibition of 1871 specimens of any varieties of earthenware that may be produced in the Highlands to meet a local demand. Many of these, though of the commonest kind, have often (says an Inverness paper) a character and interest peculiarly original.

It is probable that the Prince of Wales will lay the foundation stone of the new Royal Infirmary, Edinburgh, in October.

The death is announced of Mr. George Baird, of Strichen, at the age of 60 years. Mr. Baird was a member of the well-known firm of W. Baird & Co., ironmasters, reputed to be one of the largest concerns of the kind in the world, the principal works being at Gartsherrie and in Ayrshire.

A new cottage hospital at Stanley, near Wakefield, has been formally opened for the reception of patients. The building cost £550, a great part of which was contributed by working people.

Mr. Peter Thomas, a member of the Sheerness Local Board of Health, has, upon receiving a lawyer's letter from Mr. J. Lund, the late surveyor to the board, apologised for making use of language detrimental to that gentleman's character.

The Local Government Act has been adopted for the Tunbridge New District, and a local board of eighteen members is to be elected.

The foundation stone of the new Corn Exchange at Doncaster will be laid on the 22nd inst.

The Dantzig and Memel timber found no purchasers, and was bought in.

THE AMERICAN TIMBER TRADE.—The North American timber trade has fallen off very considerably this season, the majority of the fleet, which have arrived in this country on their first voyages, having been unable to obtain remunerative freights for the return trips. This is owing to the scarcity of timber at Quebec, the rafts from the interior not having arrived in consequence of the ice being long in breaking up. A fleet of 138 vessels, representing almost as many thousand tons, was, a short time ago, on turn for loading, which had a tendency to reduce the freights. In consequence of this, it was feared a number of fine ships would have to be dismantled for the season. At this juncture, however, freights to and from the Baltic rose considerably, and already large consignments of coal are being shipped by vessels of all classes from 50 to 1,000 tons register, Elsinore and Cronstadt, for orders being the general stipulation in their charters.

WAGES MOVEMENT.

DUNDEE.—STRIKE OF CARPENTERS.—The carpenters employed by Messrs. Alexander Stephen & Sons, shipbuilders, Dundee, struck work on Friday last for an advance of wages. They have for some time back been paid at the rate of £1 per week. Work, especially in the yard of Messrs. Stephen, has been plentiful for some time. The carpenters, thinking this a proper time to agitate for an increase of wages, held a meeting on Thursday week, at which it was resolved to ask an increase of 3s. per week on their present wages. A deputation was appointed to wait on Messrs. Stephen, and lay before them the claims of the men. This was done and the answer returned being unfavourable, the men, to the number of 150, immediately left work. About a dozen of the apprentices have since been arrested on a charge of having intimidated a carpenter named Robertson, who had returned to his work on the old terms.

MANCHESTER.—At a meeting of the Manchester Carpenters' and Joiners Arbitration Board on Monday night, the following resolution was decided upon :—"Resolved—That the practice (that has been adopted by some employers) be discontinued in the future, of the foremen stating to workmen applying for jobs that they are only paying a certain rate of wages, that rate of wages being below the standard of the town, and that after October 1st, strangers be paid at the rate of 7d. per hour the first week, and 7¼d. at the end of the second week, if proved to be average skilled workmen; with workmen who are not of average skill, the wages to be a matter of bargain between the employer and the workman."

THE SHORT TIME MOVEMENT IN THE BUILDING TRADES.—On Thursday week a public meeting of carpenters, joiners, and others engaged in the building trades was held in the Hall of Science, Old-street, St. Luke's, for the purpose of submitting a code of working rules, limiting the hours of labour in the trade; Mr. St. Clare occupied the chair. The chairman said that during the last eight months a number of district meetings had been held in the metropolis, and the position of the trade discussed. A committee of delegates was appointed, and they came to the conclusion that nothing but a limitation of the hours of labour would benefit the trade. A code of working rules was decided upon, which the delegates hoped would be mutually binding on both the employer and the employed. He contended that a code of working rules was highly necessary to keep the trade alive, and improve the position of the members. The code limited the working hours to nine per day, at 8d. per hour. It might he said that the reduction of the working hours would reduce a man's wages at the end of the week. That might be so, but a reduction of the hours to fifty per week would give employment to a vast amount of unemployed members of the trade. To prevent strikes and lock-outs there was a clause in the rules providing for the settlement of all disputes between masters and men by arbitration. Mr. Haroy said if they did not get a code of rules of some sort the position of the workmen would become worse. If the men were united no impediment would stand in the way of their improvement. He maintained that if the working classes were united, like the middle and upper classes, they would not be in their present degraded position. Mr. Crawford then read the proposed rules at length. Mr. Davis moved a resolution setting forth that the moral and social condition of the workmen would be best secured by reducing the hours of labour, and pledging the meeting to a code of rules which would give the trade 8½d. per hour. Mr. Cookson, Mr. Shield, Mr. Rombold, Mr. Dunn, and others addressed the meeting, and it was decided that the code of rules drawn up by the delegates should be adopted, Mr. Davis's resolution being negatived. A vote of thanks to the chairman closed the meeting.

THE BUILDING NEWS.

LONDON, FRIDAY, SEPTEMBER 9, 1870.

FIREPROOF STRUCTURES.

NOTWITHSTANDING that we live in a complete "age of iron," but very little use, comparatively, is made of that material in our buildings towards counteracting the effects of fire. It is true that in the majority of our new public structures timber in balk has been to a great extent replaced by cast and wrought iron, and care is generally taken that the staircases and floors are constructed so as to be fireproof, or nearly so. Regard is also had to these details in most of the gigantic warehouses and stores that are erected by our merchant princes. But including all these and many more examples, the total yet falls far short of what it should amount to in a city in which fires are almost of daily occurrence. It is unquestionably more costly to build structures of fireproof materials than of others that are not so constituted, and this is the reason why the principle is not carried into practice in buildings of secondary importance, where the first cost is the only feature considered worthy of attention. It is impossible to expect that private builders will ever introduce the fireproof system into their trade until it be rendered obligatory by legislation. This is a step which no one can say would at the present be either fair or judicious. It must not be forgotten that buildings and houses are erected now upon much shorter leases than formerly prevailed, and there is consequently neither the inducement nor the necessity for building them in so durable a manner. We have heard it stated on very good authority that a nobleman who owns a large amount of metropolitan property will not grant a building lease on the land for more than twenty-five years. No one in his senses would build a fireproof structure on a property subject to such conditions, nor could it ever be attempted by the legislature to enforce a measure of that nature, unless at the same time some radical change was introduced in the law of fixtures and dilapidations. The reversion of the tenants' property to the lord of the soil becomes too expensive an affair when durability and permanency are its distinguishing characteristics.

In all buildings the staircases, floors, and roofs are the chief elements of danger and destruction when exposed to fire. All these in ordinary dwelling-houses, and even in structures of a far more pretentious nature, are usually constructed of that inflammable material—wood. It can perhaps scarcely be advanced, so far as the safe escape of the occupants of a house in flames is regarded, that there is an absolute necessity for the roof to be fireproof, but there is no doubt respecting the floors and staircases, or, at the very least, of the latter of these. An iron or stone staircase would, in our opinion, prove a far better mode of egress from a burning house than that which is termed, by mistake, a fire-escape. Granting for the moment that this part of the question is not yet quite ripe for compulsory legislative enactments, there are undoubedly numerous instances in which the fireproof principle in its full integrity should be rigidly enforced. By the above phrase we mean that it should not be applied to merely portions of a building, but should include the whole structure. It is not enough in these cases to leave the matter in the hands of owners of property or tenants of wharves and warehouses; for suppose one proprietor to place a large store of exceedingly inflammable and combustible goods and merchandise under a fireproof building, and his next neighbour to keep his stock of similar commodities in wooden sheds—timber magazines—the former is perfectly at the mercy of the latter. Among the instances to which we have alluded as calling for the interference of the legislature for the compulsory adoption of the fireproof principle of construction may be mentioned that of the gigantic stores, warehouses, and other erections lining the shores of our great national docks. It was but yesterday that property to the value of over £20,000 was either consumed or destroyed by a fire that broke out in the Victoria Docks. The conflagration took its rise in one of the timber warehouses used for storing bales of jute. The warehouse measured 150ft. in length and breadth, and contained no less than 3,000 bales of jute. Fortunately, by dint of great exertion, the fire was confined to the single building, but had it spread to the contiguous ones the loss of property would have been enormous. It will possibly be asserted by some that although a building may be constructed of fireproof materials that will not prevent the contents from catching fire from internal causes. This is true to some extent, no doubt, for if a light were applied to a quantity of jute or other inflammable description of goods, the nature of the building that contained it would not prevent it being set on fire. But if the structure were fireproof, it should contain in itself no element of destruction from fire, and also should prevent the possibility of it being communicated to the interior from causes of an external nature. As we proceed, it will be seen that so-called fireproof structures are sometimes by no means faithful specimens of that principle. It may with truth be said that excepting the desirability of saving the lives of inmates by the adoption of iron or stone floors and staircases, there is not the slightest real utility or immunity from danger obtained by making part of a building proof against fire. It is simply a "doing of things by halves," a course of action that never has and never will attain to any permanent advantage.

Speaking from a professional point of view, the three principal subdivisions of a fireproof structure are the roof, the floor or floors, and the side walls, or carcass. Of these, considered separately, the first is the most common. In fact, any roof that is constructed of iron trussing, as a very large number are at present, in all cases where the span exceeds very limited dimensions, is, *per se*, almost fireproof, unless it be boarded over before the outer covering of slates or other material be put on. The necessity for using boards, and thus doing away, as it were, with the very principle of the roof, is, in some exceptional instances, absolutely unavoidable, as it becomes imperative to have a "cool" covering at all hazards. Even when the covering is not supplemented by boarding, unless the whole of the building be fireproof a conflagration, although it cannot actually consume, yet nearly invariably destroys the roof. That cast-iron columns, beams, and girders, are not fit to be erected again in the same position, was amply demonstrated by the unfortunate burning of a portion of the Crystal Palace. The carcass of this magnificent edifice is fireproof, so far as that term applies to fire originating in any of its actual component parts, but that did not prevent the floor, which is an immense area of planking, from catching the fiery infection from the over-heated pipes and flues. A communication was rapidly established, through the agency of the tall tropical plants and the various beautiful courts, to the glass of the roof and sides, which could melt if it could not inflame; and but for the fact that the wind was favourable to the extinction of the conflagration, there would not have been in the whole Palace "one column left on another." Had the floor of the Palace been of concrete it might not have absolutely prevented the burning that took place, but it would undoubtedly have both mitigated and retarded its course. It is very doubtful whether wrought-iron will withstand with impunity the extreme opposite effects of fire and water, but there is no question that any cast-iron, forming portion of a building that has been through an ordeal of that description, is utterly unsafe to be again employed for any purpose of construction. It is only fit for the melting pot. At the same time we have very strong suspicions that many of the columns and joists forming portions of the *debris* of the Crystal Palace fire, which were sold by auction or disposed of by private contract, have been placed in positions where they are still doing duty. To proceed still further, there are not wanting instances in which buildings erected in every sense upon a fireproof principle have been as totally destroyed as if they had been constructed of the most inflammable materials. The latest example is one which happened about a week ago. Some very extensive flour-mills, scarcely four miles from the town of Cork, were entirely demolished by this cause for the second time. After the first occurrence, it was determined by the company to re-construct the mills on the fireproof system, which had not been adopted in the first instance, in order to obviate the danger of a second conflagration. No pains nor expense were spared to ensure this object, but all the precautions failed to avert the result, which has reduced the whole premises to a mass of ruins, including some very powerful and valuable machinery. In the face of these facts, the construction of a really fireproof building appears to be a question yet to be solved, and the prospect does not seem very encouraging. While there are unquestionably some fireproof systems of a *bona fide* reliable nature, there are a large number so called which are worthless, as well by the materials used as the manner in which they are disposed and put together. There is a great deal yet to be done in this particular branch of constructive art. At present we have only made a commencement, and not a very good one either. There is plenty of room for improvement, and we do not doubt that it will soon become manifest, especially if the legislature turns its attention to so important a subject, which is so vitally connected with the safety and welfare of all great cities.

◆

SUNDRY WORKS IN THE ISLE OF THANET.

(*Continued from page* 165.)

IN the environs of Broadstairs, Stonehouse Farm buildings form a picturesque group, the house at a distance presenting the appearance of one of those interesting gabled residences which we have been describing; and its tiled roof, of a rich golden brown hue, rises pleasantly above the thatched ones of the barns around it, properly marking its prominence over them. A closer inspection, however, is disappointing. On the side next the sea there is nothing but the outline of the gable, the walling being flat and whitewashed. On the opposite side it has not been so spoilt, and the scale being larger than ordinary it is effective, but, as the date in the panel in the gable would lead one to suspect, the execution is coarse, and the bricks of the ordinary size. It is, in fact, only a later imitation of the older specimens of this class, and deficient in all their delicacy and quaintness of treatment. The inscription in the panel is—

Martha Huggett
Mary Brookes
Ann Peylen
1710

Who and what were the three departed Graces thus handed down to posterity it is amusing to speculate about; the enterprising builder we will not malign by supposing to have been a bigamist, yet it is strange that they should all appear to have been equally honoured at the same date; or could the house have been tenanted by a partnership of spinsters? We have not had time to search in local chronicles to elucidate this interesting point.

Asham gable alongside of this one is a curious example, showing how still further degradation of detail has followed the lapse of time. Its very existence would prove that fact. A panel in its gable bears the incription—

Erected
1839
Paull
Haggett

A decorative outline executed in the coarsest and vulgarest manner is all that it has to boast.

Not far from this farm is another, in the village of Smock Street, of far higher, indeed, of remarkable interest; we do not know when we have been so pleased by a modest rural structure, and yet the means by which the effect has been produced have been of the humblest and cheapest. It is of far older date than any of which we have spoken; an ancient timber-built manor-house, it would appear to be dated perhaps as far back as the latter part of the sixteenth century. Its plan that of an I, the centre rising rather higher than the wings, the roofs of which are hipped, and the whole covered with tiles, and a good group of chimneys rises out of them. The entrance is under an open arched porch, recessed in the right-hand wing. The upper story of the central portion is decorated with two large rosette ornaments, divided by fields of diaper work, all of which has been executed in the plaster, apparently by a stamp, the ornamented part being left white, and the ground around covered with grey rough-cast. The designs are thoroughly mediæval and good, and the style one which might be easily imitated in the present day for the cheapest class of constructions.

A quarter of a mile further on, and near the Broadstairs station, is a very small cottage, noticeable for the extreme simplicity with which the style of work we have described can be applied to the cheapest description of dwelling. It has only the gable ends outlined with a large ogee moulding, and a flat sort of pediment at the apex, but nevertheless the proportion and effect are good.

Proceeding onward to the village of S. Peter's, several other most interesting examples will be found; one, diapered richly with blue-black bricks on a white ground, is effective; and another has a sort of projecting backbone to the chimney stack, formed of 4½ corbelled-out brick pilaster, and this is carried down to the springing of the gable, and laterally supported or tied in by brickwork ornamentally with the flints. A house of rather more than usual importance beyond the church has a good brick porch of quaint outline and detail.

The church itself deserves more than a passing remark. It was originally a chapelry to Minster, but became a parish church about 1200 A.D. It has a long nave and chancel, with narrow aisles to the former and a north aisle only to the latter, a fine tower at the north-west angle, and a spacious south porch. The arcades of six arches on each side between the nave and aisles are of very excellent Norman work, and that in the chancel Early English, with two arched openings that once led to the organ loft in one of the spandrels. The church has been apparently very judiciously and carefully restored by Mr. Joseph Clarke, the architect, but the new details and furniture which he has introduced are deficient in tone and character of work. The ceilings yet call out for improvement, being simply plastered over, hiding all the timbers except in the chancel, which has a rather good treatment of an interesting ribbed ceiling, the portion over the sacrarium being enriched with colour.

Most of the windows have been filled with stained glass, we were informed, by Messrs. Heaton, Butler, and Bayne. Only those in the north aisle are to be commended, and those, possibly the latest executed, are really interesting, well drawn and richly coloured: we take them to be from the designs of Mr. Holliday; a band of figure subjects is carried across the centre of the windows, and above and below is grissaille work within borders. As to the rest, they are rubbish of the ordinary manufacturers' quality, with Our Lord and His Saints parodied in so grotesquely comic a style as to be almost blasphemous. The colour and drawing are atrocious; the heads look generally as if copied from barbers' blocks or afflicted with water on the brain.

On the road to Ramsgate, in the charming village of Dumpton, is a pretty brick cottage, the outlines of the gables of which are composed of a succession of portions of circles. The cottager can, if he wishes, repose under his own fig-tree, but was deaf to the adjuration on our part of "In the name of the prophet—figs!" A new Cemetery is being formed upon the heights above Ramsgate, and a chapel and lodge are being erected. To Mr. Gilbert Scott, jun., the credit of the works in progress belong, and they promise well, but are hardly sufficiently advanced for us to criticise. The lodge, however, is nearly finished, and with its archways and timber and plaster story over is stately and picturesque. Passing a very Victorian and unprepossessing, though pretentious, pile of buildings for the coast-guard, the name of the architect of which we did not and cared not to learn, we found our way, with some expectation and in haste, to Mr. E. W. Pugin's great Granville Hotel, S. Lawrence-on-sea. We were anxious to learn what would be the unfettered work of so loud a critic of the work of others. It is said he has spent £30,000 upon it, and to have been his own employer as well as architect. We were grievously disappointed. It is of the loudest Victorian (so-called) Gothic, and a heavy disagreeable mass of building, without sky-line or outline of any kind, with huge Brobdignagian sash windows and moulded lintels, &c., ten times worse than those of Mr. Waterhouse's Club in S. James's-street. One can, however, with justice thank him for the planted promenades and other attractive surroundings of his work.

COSTUME AND ART.

COSTUME may be usefully divided into *three* kinds, or modes, of clothing the "naked animal man." The first may be typified by the old Greek dress, where the evident object was to hide the figure as little as possible, *i.e.*, to so clothe and fit the human frame as not to hide or smother, but to show the form. The next other mode was the precise reverse of this, and was well typified in the magnificent costume of the ancient Mede, in whom the whole figure was clothed in flowing drapery, the object being to exhibit the splendour of the dress, and to add to the dignified presence of the wearer by its shape and folds. These two modes of dress may be said to represent the two opposite ways of clothing the human form, both equally good in their way, and obviously equally suitable for different people and avocations. It must be observed in passing that under these two heads there are a vast number of costumes and modes of dress all the world over, and in all ages, which will equally well typify the two systems; and a work of no small interest might be written on the subject if thus simply divided. The third mode we would venture to call the mode of *quaint* costume—the word quaint being used for want of a better. It may be represented by the dress of the Japanese, where the object would seem to be neither of the two above mentioned—neither to show the form of the wearer nor the grace of the dress, nor even folds of drapery, but simply to cover the body with some quaint device, almost like the strange figures on a common playing-card. It is, perhaps, the very strangest costume that was ever invented by man; the patterns, the colours, and the odd cut of the several parts making up a gorgeous show, not a little strange and quaint, and unlike everything else. There are, under this head, too, a number of different costumes from different countries and in different ages; and much of the costume of the middle ages is of this type, and has come down to us in the glass painting in the windows of cathedrals and on the walls of churches. To this class of dress belongs that of the end of the last century and of the days of Hogarth, where a sort of odd quaintness redeemed it in a great measure from contempt. Indeed, as we see it in the paintings and prints of Hogarth, it is impossible not to be struck with its oddity; and the wig and great horseman's coat, long waistcoat. short breeches, and heavily buckled shoes, make up together at least a harmonious whole, and the word quaint seems to be the only one which can well characterise it.

It is from this strange idea of a human dress that our modern costume of to-day comes by regular descent; and it of right must come under the same general heading, for it certainly does not belong to the Greek idea of dress, nor to the Median robe order of costume, nor, indeed, if the truth must be told, to the quaint, but is truly a thing by itself. It is simply the very stupidest thing ever yet invented by the ingenuity or perverseness of man. It comes under neither of those two leading principles which should regulate all costume, viz., either to show the form and action of the human frame, or to exhibit the form and folds of the dress with which it is clothed; or, to go to the third and only other way, to show mere "quaintness," as we have ventured to call it, where neither of the two first requirements of dress are aimed at. It would seem, indeed, absolutely impossible to conceive anything more ungainly and inconvenient than the present system of modern fashionable male attire—the "sustained splendour" of Mr. Disraeli—for it does not allow of the form to be seen; it is nothing in itself, there being no folds or drapery, and there is in it no sort of quaint interest to make up in any way for the loss of the two prime ideas in all dress. To confine our remarks to the ordinary fashionable male costume, we may take it for granted that the dress-up of a smart waiter at a big hotel or club may be taken as fairly typical of it. The arms and legs of the old Greeks were left bare, for not living under Mr. Gladstone's rule they knew nothing of the "anthropomorphic element" in fine art; so that when they wanted to draw the human arm they were content, poor simple, ignorant souls, to look at one, and the old Greek dress allowed of it. In our improved modern system of clothing, this it is clear cannot be done, for the climate, it will be urged, compels the covering of legs and arms. Be it so. Neither, again, does the form of the dress allow of the dress to show itself, and to become a thing of beauty *per se*, or even one of convenience; for what can possibly be more ugly or awkward than the semi-tight fitting sleeve of a common coat, or the still worse and more fashionable trousers? Quaintness will not surely be charged upon them, so that neither form, nor comeliness, nor oddity belong to it or to them, and certainly not mere and simple utility. Fashion does all the work.

It would be useless to go into the merits of the world-renowned swallow-tailed coat—that pride of the smart waiter, and last hope of those who glory in being dressed. Of its convenience or beauty, no one perhaps ever yet did boast, any more than they have done or do of the tight-fitting boot or tall chimney-pot and so dearly-fashionable hat. They are all things which the tyrant fashion compels everybody to wear and to be perpetually inconvenienced by. It really all seems to be typical of the art of the time of this latter part of the nineteenth century, when all real and genuine art has disappeared and given place to machinery and manufacture. It would be impossible to sink lower than we now are sunk in this country—at least, in all matters appertaining to art, whether high or low; and one means of rescuing things from this most deplorable state would be, as we take it, some improvement, or say merely change, in costume; and it would seem that the only channel through which any such change or improvement is at all likely or possible is in that of our army, and in the dress and appointments of soldiers.

The tremendous and disastrous failure of that gallant and so perpetually victorious army of France has been so sudden and unexpected that no man has had time to think anything about it, or how it has ever come to pass that so magnificent a body could have suffered and lost as they have done. May it be allowed us in this place to suggest *one* cause of it—the excessive neatness, primness, and fit of the clothes of the men; everything bran new, and of the brightest and gayest colours. The man was lost in his smart tailoring. And the course of the war has been so rapid that there has been no time for any one to grow shabby enough to work, or do anything, or to think of his own personal and bodily self. In the old Italian wars of the first Napoleon, the soldier wore off the smartness of his smart attire before he found himself on the battle-field, was ready for work, and thought of himself and not of his dainty clothing—all so tight, and awkward, and inconvenient, and unfit for its stern purpose. What more important subject, then, can there be than that of the art combined with utility in costume, more especially in the dress of the soldier? In it most surely there ought to be combined the two prime requisites—utility and convenience, and ease of movement with sightliness and artistic beauty, and appropriateness and harmony of colours. Cobden used to say that the French were so artistic a nation, and so clever in making the most of what other people would despise and throw away as useless, that they levied a sort of tax on the whole world in the matter of setting the fashions and showing the rest of the world how to make a dress, and then how to wear it after it was made; not, by the way, so easy a feat as some might be disposed to think; but it is to be feared that they have paid a fearful price for their artistic superiority, for what with this world-taxing smart dressing and Hyde-Park generalship the nation itself is all but well nigh lost, and their Emperor quite. It cannot be amiss, therefore, to draw attention to the art of costume, and to the best possible way in which the human body may be clothed so as not to impede its movements, and yet that this costume shall be at the same time beautiful in form and harmonious in colour. In military dress these two principles are fundamental requisites, as no soldier will be, or ought to be, satisfied unless he looks like a soldier. The old Greek went out to battle with his limbs as free as possible, and with a dress allowing of the utmost ease and freedom of action and movement; and may it not be a good and useful question, in case of any radical change of costume, either in the regular army or in the volunteer force, or in the formation of any new volunteer regiment, to depart a little from the conventional and fashionable type of clothing, and aim at something better and more workable and appropriate? Humanity itself is, as things now are, absolutely blotted out by the unsightly costume it is compelled to wear; and pictorial art is impossible all the time there are no living exemplars to keep the artist's eye and hand to the work he has to do. In either of the three systems of costume-making we have named there is to be found abundance of precedent and examples to go by; and the difficulty, if any there be, will be in the number, and not in the paucity of examples. Of course it will be understood that all that has been said of a required change in military costume applies equally—nay more—to civil costume; and it is in the hope of seeing some speedy change in the dress of the soldier, now generally admitted as desirable, that these few hints on the subject of costume, and the need of beauty and harmony in it, have been written. C. B. A.

YORKSHIRE ARCHÆOLOGICAL AND TOPOGRAPHICAL ASSOCIATION.

THE Huddersfield Archæological and Topographical Association held their fourth annual excursion on Wednesday week, the destination on this occasion being the ancient borough of Pontefract. Arrived in Pontefract the excursionists proceeded at once to examine the objects of interest in the neighbourhood, under the guidance of Mr. T. W. Tew and the secretary, Mr. Fairless Barber. Having inspected Swillington Tower and the Upper Guard House, where the courts of the Duchy of Lancaster were formerly held, the party proceeded to the remains of the famous old castle of Pontefract, making a halt at an elevated spot near the porter's lodge. Here a special general meeting was held. The president of the Association (who occupied the chair) suggested several alterations in the rules of the body, with the view of extending its operations and usefulness, and concluded by moving that "The society should henceforth be called the 'Yorkshire Archæological and Topographical Association,' and that the object should be 'to examine, preserve, and illustrate the history, architecture, manners, customs, arts, and traditions of our ancestors, and especially to further the collection and preservation of materials for the history and topography of the county of York.'" This was agreed to unanimously, and some formal resolutions following upon it were passed. The company then listened attentively to an elaborate and interesting paper by Mr. Tew on the history of the surrounding neighbourhood, with especial reference to the castle. After the reading of Mr. Tew's paper, the party proceeded to make a minute inspection of the remains of the ancient castle, and on leaving the castle the party wended its way to the rock-cut hermitage, which is one of the most interesting sights of antiquity to be witnessed in Yorkshire. The inspection of the visitors was much facilitated by Mr. James Fowler, F.S.A., who read a paper on the history and character of the scene. He traced the history from the first mention of the hermitage by Thoresby, in 1703. It seems it was founded in the year 1386, by Adam de Laythorpe and his son Robert, and in 1433 became attached to Nostell Priory. There was a garden surrounding the dwelling of the hermit, which he might cultivate at his leisure, and from this runs a narrow descending passage, leading to what was the dwelling. An irregularly quadrilateral chamber cut in the rock is reached, and by descending another flight of steps, access to a spring of water of crystal purity is obtained. On the west side of this secluded dwelling is the cavity in the rock which served the hermit for a chapel. The altar and the reading desk, also of rock, still remain intact, and on the opposite side to the altar is a settle, which must have been used by the hermit to repose or to meditate on. From the hermitage the company went to the Town-hall, where a museum, containing some most remarkable archæological curiosities, had been made up of loans from Lord Houghton and others of the leading gentry of the district. The church of S. Giles; an old house in which King James II. is said to have held his court, and which contains a fine old specimen of wood carving; and a strange vault below the Malt Shovel public-house, were next visited. The company then proceeded to the Red Lion Hotel for luncheon. After luncheon, carriages were taken to All Saints Church, mostly in ruins. Mr. J. T. Micklethwaite, F.S.A., read a paper descriptive of this interesting place, which used to be called the Minster of the Moors. During the reading of the paper the company assembled in the transepts of the old building, which have recently been renovated, and are now used for service. The greater part of the remains of the edifice, Mr. Micklethwaite said, corresponded in date with an ordination in the year 1361, by the Archbishop of York, of thirty marks from the priory and convent of Pontefract to the then vicar. The architecture mostly belonged to the latter part of the fourteenth century. During the sieges of the seventeenth century the church was reduced to a state of ruin. Special notice was directed to a remarkable double-stair in the tower, which is almost the only specimen of the kind in England. A model of the staircase was exhibited in the church. The New Hall was the last object inspected by the party. This is a grand old ruined mansion of the latter part of the sixteenth century. Carriages were taken from the New Hall to the railway station, where a large part of the company prepared for departure to their respective destinations.

THE POTTERY AND PORCELAIN OF DERBYSHIRE.*

A FEW particulars from this manual (intended as a text-book for visitors to the recent Fine Arts Exhibition held at Derby), regarding the history of fictile art in Derbyshire, may not be uninteresting. The manufacture of pottery in various forms has long been one of the chief trade resources of the county. Kilns were probably erected soon after if not before the Conquest, and as early as the fourteenth century they appear to have furnished tiles for the pavement of many ecclesiastical buildings. The manual before us does not, however, pretend to trace the history of these earlier efforts, but hastening down to the eighteenth century, refers more particularly to the principal modern factories. Foremost among these is the establishment described in the *Derby Mercury* of 1785 "as that great and extensive factory commonly known by the name of 'the Derby Pot Works.'" Its founder and date of establishment are alike unknown, and the earliest mention of the place is in connection with William Duesbury, about 1750, who carried on the works "greatly assisted" by Mr. Heath, the banker, "and proprietor of the Pot Works on Cockpit Hill." Whatever the quality of the work turned out of this establishment may have been, the quantity was at any rate large, for a notice of sale, dated March 17, 1780, to wholesale merchants in earthenware, finishes with a special announcement that "no less a quantity than two horse loads will be sold to any one person." The ware sold appears principally to have consisted of enamelled and blue and white useful china, cream ware plain and enamelled, and white, stone, and brown ware. Duesbury appears before this time to have quitted the concern, and to have established a china factory, where a new and improved class of goods was turned out under his direction. In the face of this competition, and perhaps more immediately from the bankruptcy of John and Christopher Heath, the old concern rapidly declined, and in 1785 the factory and all its belongings were disposed of by auction. Specimens of the work produced by Duesbury and the Heaths at the Pot Works exist, but are rare.

The china works appear to have been carried on by Duesbury (who died in 1786), and his son, who afterwards entered into partnership with one Michael Kean, until the year 1809, when the business passed under the management of Mr. Robert Bloor, who had been previously for several years clerk and salesman to the firm of Duesbury and Kean. He appears somewhat to have sacrificed the artistic quality of his wares to commercial considerations, and the periodical auction sales introduced by him are said to have been productive of much discredit to the works. At his death in 1846, after a long mental illness, the factory, after abortive attempts at resuscitation by others, was finally broken up.

The figure department of the Derby China Works is said to have been the largest in the kingdom. The celebrated "biscuit" body was then in its best state, and in Duesbury and Kean's time great care appears to have been taken with its manufactore. China factories and potteries of less repute appear to have existed in Pinxton, Wirksworth, Alfreton, Belper, Brampton, Chesterfield, Church Gresley, Harlshorn, Denby, Ilkeston, Newbold, Smalley, Swadlincote, Tickenhall, and Whittington.

Illustrations of some of the marks used by the manufacturers are given in Messrs. Wallis and Bemrose's book, together with some particulars respecting the artists engaged in painting the porcelain. For these our readers will do well to consult the book itself.

At the recommendation of Professor Abel, Chemist to the War Department, the process invented by Messrs. R. Gay and Co., of Alton, Hants, for waterproofing and preserving stone and other buildings, is, by order of the Office of Works, to be applied to a portion of the decayed stonework at the Houses of Parliament.

* "The Pottery and Porcelain of Derbyshire." By A. Wallis & W. Bemrose, jun. London & Derby: Bemrose & Co.

Building Materials, &c.

GLASS.

THE glass used for building purposes is of three kinds, viz., crown glass, sheet glass, plate glass. Crown glass is manufactured in circular flat tables, each having a knot or knob in the centre to which in the course of manufacture the flashing rod was affixed. As this knob would, however, render the table both inconvenient and unsafe to handle, it is usual before selling it to cut off a segment at about 4in. from the knob, and the smaller piece thus cut off is technically termed a *slab*, while the larger piece with the knob retains the name of a *table*. Crown glass is superior in lustre to sheet glass, and presents a less undulating surface.

The different qualities of both crown and sheet glass are distinguished in the trade as best, seconds, thirds, and fourths. The "best" is that which is of the purest metal, and free from blemishes, specks, streaks, &c. "Seconds" is inferior to best, in not being quite so free from these blemishes. "Thirds" is still inferior, both in regard to quality and colour, being of a greener hue; it is, however, the kind most commonly used for glazing in ordinary windows. "Fourths" is the most inferior kind of glass manufactured, only fit for out-houses and the most inferior purposes, where quality is not a consideration. In addition to these kinds the manufacturers supply a superior class, consisting of slabs selected for extra purity and lustre, which commands a higher price.

Crown glass is supplied to the trade in crates at a uniform price per crate, the difference in value being arranged for by including a greater or less quantity in the crate. Thus a crate of "best" crown glass contains 12 tables; a crate of "seconds," 15; and of "thirds" or "fourths," 18 tables. The number of square feet which may be cut out of an average crate may be estimated as follows:—Each table is from 4ft. to 4ft. 6in. in diameter, but owing to the knob in the centre and the circular shape of the slabs, there is always some waste in cutting the glass into squares. Some tables may be cut to within two inches of the knob, but others not nearer than four inches.

	Ft.	In.
Supposing a table to be 4ft. 6in. diameter, and that it may be cut to within 2in. of the centre, then the quantity of glass that may be cut from it, including the triangular pieces, will be	14	2
If the diameter be only 4ft. and the table cannot be cut nearer to the centre than 4in., the quantity will be..................................	10	10
	25	0
The triangular pieces, however, are of very little value, and must be deducted, about................	2	6
Net available contents of the two tables	22	6
Average contents per table	11	3

In this calculation we have taken the sizes of squares that will cut to the most advantage, but as it will be necessary to cut squares of all sizes from the tables as they are wanted, the average produce per table is not more than 10ft. superficial. The following are about the average prices of crown glass per crate.

		£	s.	d.
Selected glazing and Picture qualities	A.	6	10	0
	B.	5	15	0
Ordinary Glazing Qualities	Best	4	15	0
	Seconds	3	8	0
	Thirds	2	12	0
	Fourths	2	2	0

Tables are, however, now made of such a size that squares may be procured of from 24½in. to 30in. across, and these will allow of squares from 34in. by 18in., 38in. by 24in., and intermediate sizes. The extra-sized slabs are supplied at prices per slab, measured exact; the price varying from 5s. 6d to 19s., according to size, for the best selected quality, while "thirds" range from 2s. 6d. to 9s., and "fourths" from 1s. 9d. to 6s. 6d.

Sheet glass differs from crown glass in the absence of the central knob and in being manufactured in squares, not in circular slabs, by which the great waste in cutting is obviated, and the purchaser can more certainly estimate the contents of his crate. It has been known in the trade, at various times, as German plate glass, British sheet glass, broad window glass, spread window glass, and once it was called inferior window glass. This last term it deserved originally from the coarseness of the materials employed in its manufacture, the alkali being soap-boilers' waste and kelp; but the term is no longer applicable, the manufacture having been considerably improved of late years, more particularly by Messrs. Chance, of Birmingham, and Hartley, of Sunderland, and good sheet glass is now inferior to crown glass in lustre only. The crates in which it is sold are made up of sheets of various sizes as manufactured, the price per foot superficial being regulated by the maximum size of the sheets contained in the crate. Thus, in 21oz. sheet glass of thirds quality, if the maximum size of the sheets be 44in. by 34in., the average price per foot is 5d., but if the sheets be of the maximum size of 75in. by 45in., the price per foot is 1s. This great difference in price is attributable to the difficulty of manufacturing the largest sizes. The largest British sheet glass is of 75in. by 45in., but Messrs. Mason Brothers, of Glasgow, Belgian sheet glass merchants, inform us that they can supply Belgian 21oz. sheet glass of thirds quality of the extraordinary size of 80in. by 72in. The custom of the English trade in supplying the glass in crates, with squares of various sizes, is not adopted by the Belgian manufacturers. Their crates contain squares all cut to a uniform size, varying from the smallest required to the largest manufactured. This difference, no doubt, gives a great advantage to the purchaser of Belgian glass, who saves all the waste which necessarily takes place in cutting up squares of the variable dimensions found in an English crate. Table I. shows the ordinary prices of British sheet glass per superficial foot.

If the customer, however, wishes for squares cut to a particular size, the English manufacturers supply them according to special order. The prices, however, are very considerably increased, as will be seen by Table II.

The following are about the prices of Belgian sheet glass, which, however, being supplied in crates of a defined quantity and in sheets of uniform size, are really rather below these quotations, because the customer, as before remarked, may cut up the squares without waste:—

Glass-works of Andris-Lambert & Co., Marchienne-au-pont, Belgium.

Window glass, in crates per 100ft. square, French measure.	Best		2nds		3rds		4ths	
	s.	d.	s.	d.	s.	d.	s.	d.
Sizes under 26 united in.	18	5	15	0	13	2	11	2
From 26 to 40in.	20	10	16	10	14	5	12	0
From 44 to 50in.	25	0	20	5	16	0	12	10
From 51 to 60in.	32	7	26	5	17	2	13	7
From 75 to 79in.	40	0	32	10	20	0	17	7
From 80 to 85in.	44	0	36	0	22	5	20	0

The above are, of course, the average prices, and must not be understood as present actual quotations, which of course vary with the fluctuations of the market.

British fluted sheet glass of 15oz. and 21oz. is usually supplied in crates not above 43in. long, but it is made up to 50in. in length. The price is from 2d. to 4½d. per foot more than the prices of fourths sheet. 26oz. and 30oz. fluted in crates and squares are double the prices of fluted 15oz. and 21oz. respectively. Belgian fluted of 15oz. is supplied at 41s. the crate of 200ft. Obscured sheet glass (English), is supplied in all substances at from 1d. to 1½d. per foot more than the prices of fourths sheet. Belgian obscured of 15oz. is 37s. the crate of 200 feet, and of 21oz. 47s. the crate of 200 feet.

Plate glass is superior in quality and colour to both crown and sheet glass. The best kind may be tested by its perfect freedom from colour, blemishes, specks and striæ of every kind, and is not subject to dampness or "sweating;" that sort which is tinged is of inferior quality. It receives its name from its being cast in large sheets or plates.

Patent plate glass is somewhat improperly so called, it being really a variety of sheet glass. It was first introduced by Messrs. Chance, of Birmingham, in 1840. It is obtained from thick sheet glass by a peculiar process of grinding and polishing. The surface obtained by this process, though not perfectly true, is very nearly so, and in brilliancy it is unsurpassed even by cast plate. For glazing sashes of ordinary size it has nearly superseded crown and sheet glass. But for squares of somewhat larger dimensions it is questionable whether the cast plate is not cheaper. It is made in three qualities:—B, or best; C, or second; and C C, or third quality. Each of these is of four kinds, known as, Nos. 1, 2, 3, 4. No. 1 is of an average thickness of 1-16in., and is of an average weight of 13oz. to the foot; No. 2 is 1-12in. thick and 17oz. to the foot; No. 3 is 1-10in. thick, and 21oz. to the foot, and No. 4 is 1-9in. thick, or 24oz. to the foot. No. 4 B is thus the very best quality made. It is manufactured in sizes from 4ft. to 13ft. in area, not above 50in. long, or 36in. wide. This glass is supplied of three colours, viz., the "usual" and "light"—these are more or less tinged with green;—and the "extra white," which is almost colourless. The "usual" and "light" colours are most preferred for glazing purposes, being harder, more lustrous, and less liable to be scratched in cleaning; the "extra white" is, however, best for engravings, water-colour drawings, &c. Tables III. and IV. show some of the prices.

Polished plate glass can be obtained for general glazing purposes up to about 80ft. superficial of two qualities, "usual" and "best." The usual thickness is ¼in.; higher prices are charged for glass selected to be cut above 3-16in., 5-16in., and ⅜in. thick, while for above ⅜in. thick special prices are charged. It is sold at per foot super., and the prices per foot rise considerably with the size of the plate. Thus for the best glazing quality of plate glass, plates between 2ft. and 3ft. can be had for 2s. 4d., between 6ft. and 7ft. 2s. 11d., between 12ft. and 16ft. 3s. 5d., between 40ft. and 45ft. 4s. 1d., and between 55ft. and 60ft. 4s. 4d. per foot. Above 60ft. special prices are charged.

Rough plate glass, cast, is used for roofing in skylights, windows. &c., in plates from not above 20in. long to above 120in. long, in thicknesses of ¼in., ⅜in., ½in., ¾in., 1¼in. and 1½in., but these thicknesses have certain limited lengths. The widths are the same as for plate glass. This glass is not ground or polished, but rough from the table on which it is cast, and showing the marks of the table on its under side. It may be had ground upon one or both sides, in which case it is charged the same as its thickness before grinding; thus ¼in. thick when ground is charged as ⅜in. rough, and an additional charge is made for grinding.

The patent rolled rough plate is a different kind of glass to the foregoing, and is extensively used for ridge and furrow roofs, conservatories, manufactories, skylights, and places where obscured glass is required to intercept the vision without diminishing the light. It is made of two kinds, plain and

fluted. The "plain" is merely marked by the fine grain of the table upon which it is cast. The "fluted" is of two sorts—No. 1, large pattern, having 3½ flutes to the inch, and No. 2, small pattern, having 12 flutes to the inch. The large pattern has a bright and glistening appearance, and is adapted for situations at a great distance from the eye; the small pattern is best for situations where a clear glass and much non-transparency are required. It is sold in stock sizes, as manufactured, in crates for cutting up, in plates of 30in. wide and from 40in. to 50in. long, or of 20in. wide and from 50in. to 70in. long. It may also be had above 70in. in length.

There are many other varieties of glass known in the trade, but they will each come under one or other of the heads above enumerated, and the foregoing remarks will be quite sufficient to enable the reader to judge of the general commercial value of the different kinds used in building. To estimate its intrinsic usefulness for the different purposes to which it is applied, it is necessary to have some knowledge of the ingredients used in its composition, and of the chemical effect of each upon the mass, together with the peculiar properties of each kind, and this we propose to give in succeeding articles.

◆

THE ELEMENTS OF HAND-RAILING.

MR. ROBERT RIDDELL, of Philadelphia, has just published, through Claxton, Remsen, and Haffelfinger, Philadelphia, and Trübner & Co., London, a very useful book on hand-railing. In his introduction Mr. Riddell says:—"There is no part of the joiner's art which demands more nicety of attention, and carefulness in practice, than this of stair-building and hand-railing; for nothing will so clearly prove the merits or demerits of the workman. The stairs is the great feature of a building. In the grandest houses it is the first object which meets the eye and claims the attention. Its lines are so open to criticism that there is no avoiding the consequence of their failure—the adverse verdict falls, deservedly or undeservedly, on the whole house. The impression produced, being the first on entering the hall, is not to be wholly eradicated afterward by any commendable features elsewhere. Therefore the stair-builder has much to answer for, and a character to establish or sustain by his work, which should call for the fullest effort of his capacity, and the most workmanlike ability he can bring to bear upon his task. It is not a matter of surprise, then, that this subject should have drawn out the best efforts of experienced and practical authors, who have given it their closest attention, with a view to rendering its mysteries easy of comprehension, and pleasing as a study."

The author concludes his introduction with the following practical suggestions:—

"The principal lines in the following system of hand-railing, being right angles and parallels, the readiest way to draw them is, with the use of a straight edge, a square, and a bradawl. Lay on the straight edge, and fasten its end with the bradawl, placing the square against the straight-edge. Next move both together until the blade of square and ordinate agree. You are now ready to draw *parallels*.

"The next line is the *seat*, which in all cases is square with ordinate.

"Be exact in drawing every line, and especially those for bevels.

"The moulds are struck with a string, or a fine twine made of such material as will be least liable to stretch.

"Have the elliptic curves on mould correct, so that the cylinder part of wreath piece may be true, showing that when the slabs are cut off the upper and lower sides, that the wreath is a parallel width. Let order, neatness, and accuracy appear in all your operations.

"Avoid the ugly habit of cutting and slashing, then ogling your work on the skew with one eye, and the other shut.

"When there is a mark or line, intended for a purpose, work to it. Have no fitting, guessing, or tinkering.

"Never make two cuts where one will answer.

"Be sure that your drawings are correct in every particular; and when fully satisfied on this point, commence the job without doubt or fear as to the result.

"Mark and cut the plank square through, according to mould. This is much better than cutting the wreath in parallel width; as the material saved is not equivalent to time lost in squaring the piece.

"Have all the joints correctly made; also bevels properly applied. An error in either renders both work and material a loss.

"Mark the tangents on both sides of mould.

"Let bevel lines that pass through half the width and half thickness of rail (shown on joints) be continued on surface of stuff, and square with joint.

"The application of mould is to make its tangents stand over those on stuff. This simple method gives the wreath its cylinder form, and directs the working of it.

"In taking lengths of straight rails which connect with wreaths—measure from spring to spring, or plumb lines. These are marked or shown on shanks of platform stairs."

It is our intention to reproduce in the Building News some of the most suggestive portions of Mr. Riddell's very useful work. This week we give what he says "On the Circle and its Tangents;" next week will appear "Sections of Cylinders; the Ordinate—its use and value." Those who wish to know all that is said by this practical author are referred to the book itself.

Plate 1.—The Circle and its Tangents.

Figure 1. Describe a circle, and enclose it by tangents, forming a square at A; the acute angle at B; and obtuse angle at D.

On this simple diagram rests the whole principle of hand-rail construction. And as no wreath can be formed without a mould, and no mould be produced correctly without tangents, it is desirable that this should be distinctly understood. The tangents marked on the surface of a mould, when in position, stand exactly over those on the ground plan. Thus all wreaths that stand on a pitch must form elliptic, not circular curves. The succeeding problems will fully explain this principle.

Fig. 2 is a form that approximates to the elliptic curve. It is struck from centres L, H, T.

Let A C be the long diameter, B D the short. Join C D. Let D E equal B D. Drop the perpendicular cutting F. Let D N and C H equal F E Join H N. Bisect it, and draw the line cutting L. Thus giving L, H, T as centres, from which the curves are struck.

By using more centres a truer ellipse may be found; but the object is to make the problem plain, so that it may be practically applied to the construction of *strings for stairs*, and other work requiring to be bent by kerfing.

Fig. 3. Here is shown the *trammel*, and its application to the elliptic curve.

The long diameter 2, 3 is called the *major axis;* and the line O D the *minor axis.*

The curve is struck by adjusting the heads on the rods. For example: Let A C equal O 3. Have B C equal O D. Now move the head C, where a pencil or point is fixed, and the curve is traced in the most perfect manner.

Fig. 4. This problem shows the ellipsis struck equally true by means of a string; the operation being much quicker and more off-hand. Two pins and a string are the only requisites; and almost any one can comprehend and practise it.

To strike the curve: Let A C be the long diameter; and B D the short. Set the compasses to A B; and, with that distance, take D for centre. Then intersect at H and L. Stick a pin in each. Tie a string to that in L. Bring it around pin in H, as shown. Next, stretch the string with a pencil, until its point touches D. Now sweep the curve toward A. Return to D, and complete the curve to C.

The pencil should have a notch near its point, in order to keep the string from slipping. The string should be of a material that would stretch the least.

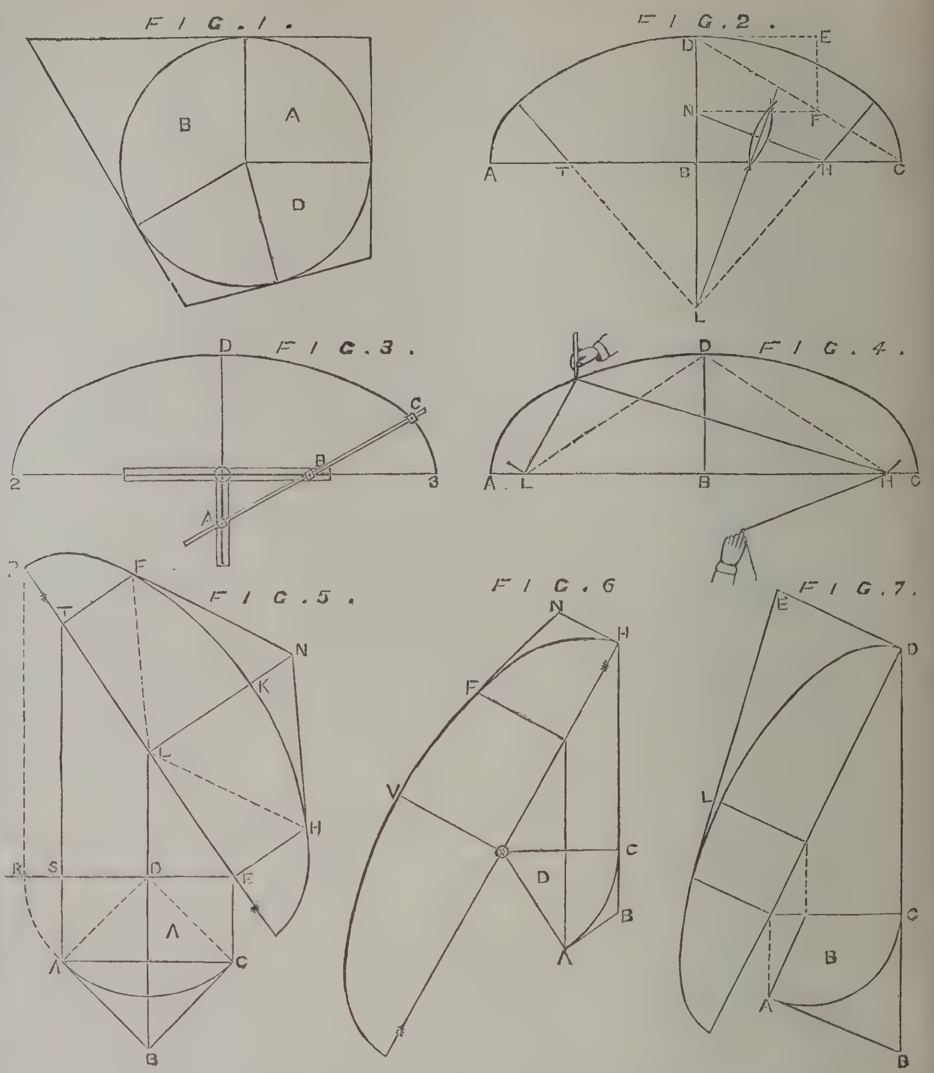
Should there be any one who is not acquainted with this very simple mode of drawing the ellipse, let it be learned at once; it takes but a few minutes, and the materials are always at hand.

Two pins and a linen thread struck every mould laid down in Mr. Riddell's book.

Try it on a piece of board, or anything most convenient. If the first attempt should fail, try again and again until perfect; remembering to keep the hand and pencil steady, and the string gently stretched, so that the curve may be produced with neatness and accuracy.

In order to prevent repetition, it is necessary to state here that as the method just given has been adhered to in all the drawing of moulds presented in Mr. Riddell's book, it will be understood that the points for the pins are indicated by * *.

Fig. 5. This diagram shows the tangents and the elliptic curve drawn on a flat surface. These, when in position, stand over two sides of the square A, the inclination or pitch being T E. The tangents A B and B C form the right angle. Those which are to stand over them form the obtuse angle. This, however, must be determined by construction. For example: Take the line B D extended as the ordinate; draw from A and C lines parallel with it cutting the line of inclination or pitch at T and E. Next, square over from T, L, E. Make T F equal S A, and L N equal D B. Also, E H equal E C. Then join H N F, and we have the required angle, as well as the lengths and tangents to stand over those on the square A.



HAND-RAILING.—PLATE I.—THE CIRCLE AND ITS TANGENTS.

The line cutting the corner of the square D is called the *base* or seat; and always makes a right angle with the ordinate.

To find half the length of the elliptic curve on its long diameter. Let D R equal D A, then draw R P, which gives P L, the required length. The minor axis L K always equals half the diameter of the given circle on the ground plan. Or, in other words, let L K equal D A. Now find points to insert pins, and sweep the curve by the method already given.

It will be seen that the curve touches H and F in the same manner as the tangents or sides of the square touch the curve A C. Such will be the case in the practical construction of every wreath in hand-railing. Therefore the tangents which stand on a pitch or inclination have to be obtained first, before the elliptic curve can be drawn,

Fig. 6. This further illustrates the value and importance of the ordinates and tangents.

Let the segment D be the ground plan. Enclose it by the tangents A B and B C. It is now required to project these to any given pitch, and show the angle they make on a flat surface. Assume B C as the ordinate: extend this, say to H. Let H O be the given pitch. Then the line H N being square with it, and the same length as the ordinate B C, shows that H N must fall level and rest on B C, while N F stands over B A, and on the given pitch H O. Then the tangents F, N, H, on the elliptic curve, give the exact angle as it stands in position over A B C, the plan. The minor axis of the elliptic curve being O V, which is equal to O A. These lines, when in position, range with each other, and O V falls level, the same as N. H.

This will be the case with the minor axis of the elliptic curve in every position: no matter what pitch or inclination a wreath may have, its minor axis, wherever situated, remains level. And this goes to show that there is no such thing in hand-railing as springing the plank, or throwing it up or down. It is simply the ordinate that changes the position of the major and minor axis on the surface of the plank.

Again, tangents which form either acute or obtuse angles on the mould can never be marked on the plank so as to run parallel with its edge on the major axis.

It follows, therefore, that the tangents on the surface of the plank must stand on these given pitches, and the minor axis fall exactly level; so that the edge of the plank in all positions makes a true and pefectly plumb line.

This is a fixed and unalterable law in hand-railing.

Fig. 7. Here we have B as the given plan; its circle enclosed by the tangents A B and B C, forming the acute angle; the construction being precisely the same as that of D, Fig. 6. Either of the tangents may be the ordinate; say B C; and the height C D the given pitch, as shown. Then D E, being the same length as the ordinate B C, shows that D E falls level; consequently L E must stand over B A, and the angle of projection is L E D.

These problems are not difficult to understand, there being nothing in them intricate or complicated; yet they are the very groundwork of constructive hand-railing.

Once more the learner is urged not to pass this plate without fully comprehending its intention and meaning.

(*To be continued.*)

The engineers for the new foot-bridge at Barnard Castle are Messrs. Robinson and I'Anson, of Darlington, and the contractors are Messrs. Pease, Hatchinson, and Co., of the same town.

Furniture & Decoration.

THE THEORY AND PRACTICE OF MODERN HOUSE PAINTING AND DECORATION.

By An Experienced Workman.

PREPARATORY PROCESSES.

(Continued from page 173.)

A VERY important branch of our subject is distemper painting—a kind of painting in which the colours are mixed with water and size. Various kinds of vehicles may be and have been used for this purpose, such as milk, white of egg, vegetable gums, flour, starch; in fact, almost any and everything containing gluten has been pressed into the service. Many kinds of animal size, as glue, are used; size made from parchment clippings; ordinary glue size, made from the hoofs of various animals, bits of skin, and all the refuse of the tanners' and knackers' yards; or glue made from fish bones, which is a fine clear glue, and is called Russian glue (it being principally imported from Russia). In the North of England a size is made by the tripe-dressers from sheep's trotters, and is called trotter size; this, when used fresh, and in good condition, is very clear, and equal to any size for mixing with distemper colour. In years gone by the decorator had to prepare his own size, principally from parchment clippings; and we are not sure but that this is the best plan yet, especially for special work, as we can then make sure of having it pure; for it often happens that distemper work will turn out bad, although the greatest care has been taken in mixing the colour and preparing the work, and we are quite sure that this often arises from some defect in the size used. Size is now made for sale in the state of a stiff and strong jelly, and sold by the hundredweight; consequently, something has to be added to it to prevent it putrifying or going bad, and we are not quite clear as to whether this preventive has not, in many cases, and in some peculiar states of the atmosphere, an injurious effect upon certain colours and mixtures. All decorators have had experiences of this sort, and we cannot account for them in any other way.

Distemper work, when well executed, is very much superior to oil colour in the pureness of its tone. Distemper is decidedly whiter than white lead in oil and will retain its whiteness much longer, and of course any tints of colour in distemper have a pureness of tone not possible of attainment by using oil colour, and therefore it is preferable to use distemper for many purposes on those parts of public buildings and dwelling-houses not liable to suffer from contact or wear and tear. The preparation of ceilings and walls for finishing in distemper is of vital importance to the ultimate result, inasmuch as if they are improperly prepared they will rarely turn out well at the finish. A great point to attain is to stop the suction, for except the finishing colour lays on cool and without any or with very little suction, the work is apt to be more or less rough, and will gather or accumulate more colour in one part than in another, and consequently will look shady. And here we may note a fact which shows the necessity for the use of a preparation. It will almost invariably be found that one part of a wall or ceiling will have a greater power of absorbing either water or oil paint than another part, which fact is most plainly seen in painting them with oil paint; in every case it will be found, even with the first coat of paint, that some parts will be glossy while other parts are dead—that is, the paint has sunk into or been absorbed on the dead parts, while on the glossy parts it remains on the surface (of course, in oil painting this is remedied by successive coats of paint). This arises from the unequal finish of the plaster work. Some parts are trowelled and pressed together more than others, and an unequal surface results. Now, in using distemper upon such plaster work it will be more quickly absorbed upon those parts which have not been sufficiently worked with the trowel, and the colour will, as a natural consequence, gather and accumulate on those parts, while it passes over those other portions which have been well trowelled, and thus we get a bad ceiling or wall; therefore it is necessary that we should cover the wall or ceiling with some preparation which shall stop and equalise this power of absorption, and without which no good work will result. As a consequence of these difficulties there are conflicting opinions as to the best methods of preparing both new and old ceilings and walls. Various mixtures are used with varying success; but we prefer to use the following mixture as a preparatory coat, viz.:—Mix about a dozen pounds of the best washed whiting with water to the consistency of a soft paste; add sufficient parchment or other size to bind the colour fast; add about 2oz. of alum and the same weight of soft-soap dissolved in water; mix well together in a pail (of course somewhat similar proportions will answer for any quantity), and strain through a coarse cloth or a metal strainer. The colour should now be tried on paper and dried before a fire, or otherwise, in order to test the strength of the size and see whether it is fast-bound, so that we can lay on the finishing coat without disturbing the first one. The alum and soft-soap assists us to gain this effect in a great degree, and helps to form a semi-impervious coating upon which the finishing coat will work cool and without suction. Caution must be observed not to have the size too strong, else it is very liable to chip, especially in rooms where much gas is burnt or heat evolved. A little suction is sometimes an advantage, but when the suction is great it is almost impossible to make a good ceiling. We often find it necessary to give both new and old ceilings one or two coats of oil paint before putting on the preparation, but on walls we have found that it is a bad practice, simply because distemper colour on walls, if prepared with distemper preparation, will give and take without injury, according to the state of the atmosphere. But if the distemper is put upon painted walls the absorbent power of the distemper is stopped; consequently, when a room is crowded with company, and much gas is used, the air is charged with moisture, which condenses on the walls and runs down the surface and discolours and stains the walls.

Old ceilings and walls require to have every particle of the old colour washed clean off, and all cracks or holes stopped up. Here we may note that whenever there is a bad crack in a ceiling, it is always best to cut the plaster away for about an inch on each side of the crack, and then plaster up the cavity with plaster of Paris and putty; we are thus enabled to make it level with the ceiling on each side, and the defect will not be perceived when the ceiling is finished. On the other hand, if we merely stop the crack without cutting it away, we leave a projection, because it will almost invariably be found that one side of the crack is lower than the other, and therefore, if only stopped, must form a ridge, except cut out as described above. Great care and pains should be taken to clear out all the whiting or colour from any ornamental plaster work, as distemper colour is apt to fill up the interstices and fine parts of all enrichments. In cleaning and washing them out, small brushes and pieces of soft wood of various shapes will be found useful; for except care be taken much of the ornament may be spoiled. When well soaked with water and carefully cleaned, this work may be got as sharp and clear as when new. We prefer in all cases to paint the enriched cornices and centres to a room, and finish them in flatting, for however careful we may be in using distemper upon such work, it is almost an impossibility to finish it without filling up the finer parts to some extent, and nothing looks so bad as ornament so filled up. We frequently see this done—one coat of distemper upon another, until the detail of the ornament is obliterated and spoiled—a species of barbarism which cannot be too strongly condemned. The same process of preparation will answer for old ceilings as well as new, with this difference, however, hat old ceilings may and often do require two coats of the preparation colour. Old ceilings are sometimes badly stained and discoloured, from the accidental overflow of cisterns, water-closets, &c. Many mixtures are used to kill or obliterate these stains. Cow-dung, lime and soap, and a host of other things are used, and much time and labour is lost, but the simplest, most economical, and most effectual cure is to give them one or two coats of oil paint; in fact, whenever a ceiling is badly stained or discoloured, wash it off and give it one or two coats of paint; it will save time and make the best job.

(To be continued.)

◆

THE CHURCHES OF S. CHAD, HAGGERSTON, AND S. ANDREW, PLAISTOW.

THE churches dedicated to S. Chad, Haggerston, and S. Andrew, Plaistow, which form the subjects of our illustration, have been recently erected from the designs of Mr. James Brooks, of 11, Serle-street, Lincoln's Inn.

Both churches have been built for neighbourhoods essentially poor, and though differing in character have been made to display one or two similar and particularly prominent features; first of all, the church being the really principal edifice of the parish in which it is situated, every effort is used to make this felt in its construction, and simplicity of material and detail are combined with breadth of design to give to it the imposing and massive appearance which its purpose and position demand. The principal element in the fulfilment of this intention is height, the ridge of the roof of each church being about 70ft. from the floor. In another similarity of design they also partake—that is to say, in their ability to accommodate large congregations on the ground-floor without the aid of galleries; by the employment of shallow aisles, the architect has also contrived to obtain for the congregation greater facilities than ordinary both for seeing and hearing.

In giving a more particular account of each church, we will, on account of priority of consecration, commence our remarks with a description of that of S. Chad, Haggerston. This church is situate in Nichol's-square, a short distance from the Hackney-road, and is built of brick, the facing of the exterior and interior being both of red brick with stone very sparingly introduced. All the string-courses are executed in moulded brick, as also the mouldings at edges of jambs and arches. The church consists of nave and aisles, north and south transepts projecting very slightly from the face of the main walls, chancel, north chancel aisle (used as an organ chapel), and south chancel aisle (used as a morning chapel), also two vestries for clergy and choir respectively. The entrance to the church is at the west end, by two doors communicating with a narthex. The nave is separated from the aisles by an arcade of four arches with boldly proportioned piers, and the whole of the light is derived from windows in the clerestory or at the clerestory level, there being none in the aisle walls. The nave and transept roofs are boarded on the under side of the braces and collars, so as to facilitate the transmission of sound. The chancel and south chapel have apsidal terminations, and both are covered with red brick groined vaulting, having stone ribs and carved bosses. Panels have been left beneath the windows of chancel for the insertion of subjects taken from incidents of the birth, life, and death of Our Lord. The altar, with a carved stone reredos, is placed at considerable elevation above the nave floor, and a dwarf stone screen-wall, having tiles introduced in various patterns on the surface, divides the nave from the chancel. The choir stalls are of oak, and the remainder of the seats are of pine. The whole of the floor area is laid with Staffordshire tiles. The accommodation is for 700 persons. Mr. W. Henshaw was the contractor for the erection of the church; the gas fittings were executed by Messrs. Hart, Son, Peard & Co.; and the choir stalls by Mr. A. Robinson, of Holborn.

The church of S. Andrew, Plaistow, is situate in the Barking-road, close to the part where it is intersected by the northern outfall of the Metropolitan Main-Drainage system. This church is constructed of Kentish rag, and is faced internally with the same material. It consists of nave and aisles, with chancel, north chancel aisle, transept on south side of church, a large and imposing tower, 31ft. square externally, and vestry in the south-east corner of the church, communicating with the south transept. The entrances are by a south porch and a deeply recessed and moulded western doorway, divided in the centre with a stone pier, having a canopy figure and pedestal on the exterior. The tympanum of the doorway is of stone, pierced with a quatrefoil light containing painted glass, of which the patron saint is the subject. The termination of the chancel is apsidal, and that portion of it which is beneath the tower is covered with groined vaulting in Kentish rag, and Bath stone ribs. An arcade is formed in the inside face of the clerestory walls behind the windows, and is continued at the same level on the west wall, as well also as behind the chancel windows. The tower remains at present at the level of ridge of nave roof, but the intention is to complete it as soon as the funds will permit. The altar and reredos are in this church also placed at great elevation above the nave floor. The reredos is especially rich in effect, and was a special gift to the church. It is of stone, enriched with carving and inlays of tiles, but is most noticeable for the fine figure-subjects, executed by Mr. Nichol, of Lambeth. The font at the west end of the church was also a special gift, and is of bold and massive design in various rich marbles, executed by Messrs. Burke and Co., of Regent-street. The floor of the choir and sanctuary is laid with Minton's encaustic tiles, and the whole of the remainder of the church with Staffordshire tiles. It is calculated that the church will accommodate 1,200 persons. The general contractors for the works were Messrs. Perry and Co., of Stratford; the gas fittings were executed by Messrs. Hart, Son, Peard, and Co., of Wych-street.

PRACTICE RATHER THAN THEORY.

THE question that has been raised in the last few numbers of our journal—that of the success or non-success of the competitive system for selecting candidates for Government appointments—is one of great importance and well deserving discussion. An incident which has recently come under our notice would lead to the thought that not only in the branches of the service we have alluded to, but in others, affecting greatly the political welfare of our nation, it is desirable that its working should be viewed with caution and criticised with discretion. A retired Indian officer informed us the other day that the mixture in the class of men now sent out to that our dependent province had been exceedingly prejudicial not only to the social status of the English there, which had, of course, a very great influence on the comfort and the character of those countrymen of ours who are necessarily thrown much together in a strange land, but also upon the ideas of the highly-observant natures among whom they are placed. To elucidate this, he informed us that a civilian of high standing, being recently about to leave the principality, was accosted by a native merchant, desirous of knowing who would be likely to supersede him, with the remark, "All that I hope is that it will not be one of those competition wallahs." Such a remark is pregnant with warning; the more so as the report has just arrived that insubordination has broken out in the native troops. We take no alarmist view, however, nor would predict any extensive outbreak from the circumstance that has occurred. We do not doubt that difficulties—if difficulties are to arise—will be met with courage and with zeal by the less refined, as well as the polished gentlemen, of our service in India; but we do think that if the prejudices of the nation are to be smoothed, and their esteem to be preserved, it can only be by sending among them such men as can command reverence by their pre-eminence in ability and love by the graciousness of their manner.

We had written *Practice versus Theory* as the text for our remarks, but upon second thoughts would not put them into opposition, but rather, as S. Paul contrasted faith with works, would point out that theory, without practice, is little worth, and practice, founded upon experience, is a guide generally to be safely recommended. Thus it is we felt that the failure which has attended the endeavour to find surveyors for government offices by competition needed to be noted for future profit. The calamity of appointing a man who has practically proved himself to be most untrustworthy for such a post, simply because he surpassed his competitors in theoretic knowledge of its requirements, has been escaped, as we happen to know, by a mere fluke. When, however, the present insane crusade against architects is over, we have little fear of the ultimate result to them. A body of men who have chosen their profession, and carry it on, for the most part, in a spirit of enthusiasm, the rules of whose Institute bind each one of its members to sign a declaration that they will conform their conduct to a lofty code of honourable etiquette, are not likely long to be set aside by an intelligent public, and the employment of quacks can never, we believe, be other than temporary.

VILLAGE WATER SUPPLY.

IT is hardly possible to over-rate the importance of village sanitary economy. Almost every summer there are gravel and chalk districts in this country, of large area, whose inhabitants during the best part of the hot season are positively in distress for want of water. We append a condensed extract from Mr. Denton's papers on this subject:—"The sources of private character which would be comparable with a public supply are:—1. Wells sunk down to a shallow depth, affording a constant supply of water, to be raised by a common lift-pump. 2. A running stream of unpolluted water passing the doors of the inhabitants, from which they can dip out all they require. 3. The storage of roof-water."

With reference to wells, he remarks that no privies or cesspools, nor leaky sewers, should exist within such a distance of the wells as will allow of the infiltration of excrementitious matter. Secondly, he says, where dependence is placed on a supply obtained by dipping from a stream running through a village, care is necessary to prevent surface defilement, and steps taken to lower the water standing in the soil.

About the storage of roof-water he observes much can be done by house and cottage owners by the provision of tanks, in which to collect and store roof-water. Assuming that if a private house, with its out-buildings, covers a space of 10 poles, the roof being of slate, and that the waters dripping from the roof are properly caught and conducted into the water tank, the private house will have the command of 28,280 gallons of water in a year; and assuming that the space covered by a farm labourer's cottage be 2½ poles, the roof of slate, the cottage will then be able to command 7070 gallons of water a year.

WATER SUPPLY BY PUBLIC CO-OPERATION.

"Failing sufficiency or proper quality from either of the three private sources enumerated, there remains to be considered how a village may be economically supplied by public co-operation. It is not improbable that, even where private sources now exist, a public supply may, under a combination of advantageous circumstances, be the cheaper means of service. The various means at command may be classified under the following heads:—1. The use of a constant or an intermittent supply existing above the village, and conducted to it by gravitation. 2. The raising of subterranean water lying beneath or near the village. 3. The use of a stream near at hand, but at lower level than the village, both as a supply and as motive power to raise the required quantity. 4. The use of steam-power in the place of other motors."

"The difference" (says Mr. Denton) "between a constant run of water and the supply to be gained from an intermittent discharge by the aid of storage is very great, both with respect to cost and quality; for as the supply to a village is comparatively small, and the opportunities of collecting it in any deep natural receptacle rare, recourse must be had to comparatively shallow reservoirs, which are open to the objection that vegetable and animal life thrive in them, and when they decompose render the water less pure. This objection is, however, met by constructing the reservoir in such a manner as will allow of its being emptied every year and properly cleansed. The proportion of the rainfall discharged by under-drainage during the winter from clay lands will not be less than 3½in., where the annual rainfall does not exceed 24in., and the proportion due to the winter is not less than 9 out of the 24in. This amounts to 79,183 gallons per acre. To supply a village of 400 inhabitants with 10 gallons each per diem, a total quantity of 1,460,000 gallons will be required for the year's supply, half of which (730,000 gallons) must be stored during the discharging period for use during the remainder of the year, with an addition of 50 per cent. for evaporation, waste, &c. By this means a village may be amply supplied with water all the year round, the quantity used during the winter being supplied direct from the outlets, and that of the summer from the reservoir. A reservoir capable of holding the quantity required would occupy about 4-10ths of an acre, assuming the depth of water not to exceed 10ft. The whole expense of constructing such a reservoir, with supply-pipes, &c., would probably not exceed £400 (putting a fair value on the land required), which, if repaid with interest in thirty years, would involve an average annual charge upon each dwelling of about 8s. if sixty dwellings composed the village. This is rather lower than the minimum rate which it has been already stated the labouring cottager can fairly afford to pay."

In regard to the second proposition, the raising of spring or subterranean water lying beneath or near a village, Mr. Denton says:—"The depth from which the water will have to be raised may vary very considerably in different formations but there is no limit to the height to which it may be raised if the motive power is appropriately selected. Three kinds of power present themselves for application—namely, horse, wind, and steam-power. Of these it is only intended to dwell upon wind as the most appropriate, if it be supplemented by horse-power when the force of the wind is not sufficiently great to drive the machinery. The cost of the wind-engine, with tank to hold 16,000 gallons, and all requisite appliances, would probably reach £750, including a supply-main down the village street for a distance of half a mile, but excluding connections with the dwellings. A cessation of the duties required by the wind would seldom last more than a fortnight at a time. When this should occur, a horse working half a day would suffice to furnish the village with the supply of 4,000 gallons, and thus two whole days' work would suffice to fill the tank of 16,000 gallons, or four days' supply. Where a stream is near at hand, but at a lower level than the village, and where it can be utilised both as a supply and as motive power, three descriptions of machinery present themselves for consideration. These are the hydraulic ram, the turbine and pump, and the undershot wheel and pump. The cost of the hydraulic ram, working with a fall of 8ft., and capable of raising daily, to a height of 40ft., and a distance of half a mile, 4,000 gallons of the same water by which it is moved, with a supply-pipe down the village street, half a mile long, and exclusive of the connections with the dwellings, would be £360. The turbine, working with a fall of 20ft., and capable of raising daily 10,000 gallons of water (taken from the stream, and filtered in its passage from thence to the pump well) to a height of 100ft., with pumps and raising-main for forcing the supply a distance of a mile, including supply-pipe down the village street, half a mile long, but excluding connections with the village, would cost £650. The water-wheel, capable of doing the same work as the turbine, but working with a fall of 3ft. only, instead of 20ft., with pumps, raising main for forcing the supply a distance of a mile, including supply-pipe down the village street, half a mile long, exclusive of house connections, would cost £750. Where none of the foregoing plans are available, the steam-engine forms the last and a never-failing resource. The kind of pump most suitable would be the double-acting lift and force-pump, or possibly three ram-pumps forcing water into one ascending main. To form a comparison between this description of power and that of wind or water, it will suffice to state that the first cost of a steam-engine to raise the same quantity, height and distance, as was assumed in the case of a turbine and wheel, would be £725; but with steam-engines the annual cost of fuel, stores, wear and tear of the machinery, and attendance, would amount to a considerable sum; while with rams, turbines, and water-wheels, worked by a constant flow of water, the annual outgoings are only nominal."

THE PATENT LAWS.

If we examine a long patent litigation, from its miserable commencement to its lamentable close, we perceive nothing but imperfect decisions appealed against and reversed, again appealed against and again reversed, recommenced with similar results—an absolute confusion out of which no side or party can see the end or issue, and in the end success of the party possessing the greatest tenacity and the longest purse. Look at the litigation which Mr. Bovill underwent, and during the progress of which he died; when brought to an end by the complete success of his executors the defendant was found to be a man of straw, and went through the Bankruptcy Court owing no other debts than the costs of this litigation and £3 for a water-rate.

What is the remedy for which inventors and patentees cry out aloud? Give us a competent tribunal, where our causes may be carefully heard and where authoritative decisions can be arrived at. The present courts are too crowded, their judges are overworked, the questions involved are too technical to be understood or weighed without professional knowledge, the present judges are bewildered, and the juries confused. When a patent case comes before a judge, does he not try to shirk it by every means he can? The array of models and scientific witnesses throws him into a terror. How can his mind, occupied by ten thousand other things, bring itself to understand and enter upon some subtle question in an act of which, probably, he has only hitherto heard the name! If there be this difficulty with the judge, how much more must there be with the jury, an assembly of men of ordinary but not refined intelligence! How can the grocer, fresh from his shop, decide some nice point in chemistry; or the baker, from his oven, weigh some delicate law of mechanics? The thing is absurd; and why the system should have so long endured is only another proof of the extreme conservatism of English institutions, and inelasticity of its boasted common law.

We believe that if a court were specially appointed for the trial of patent causes, presided over by a judge selected for his special technical attainments, and whose previous practice has been greatly in patent causes, and this judge were assisted by scientific assessors chosen for their special eminence in the various branches of knowledge, and that a jury be summoned of men possessing special knowledge of the matter in question—if one of chemistry, a jury of chemists; if one of mechanism, a jury of mechanics, and so on—that the patent system of England would no longer be a disgrace to her, that we should no longer hear of crude notions of its entire abolishment, and that the life of an inventor would need no longer to be spent in litigation.

WORKING MEN'S EXHIBITIONS.*

After nearly twenty years of experience it has been discovered that in order practically to interest working men in artistic and industrial exhibitions, they must be partakers in their management and share the rewards of success. At the Agricultural Hall, Islington, there is to be a display commenced during the present month, in which this principle will be, for the first time, amply recognised. Celebrated firms and large employers of labour will compete; but to every specimen of ambitious handicraft will be affixed the name of the artisan who wrought it, so that, by obtaining a prize, he will carry a perpetual certificate of skill, which can scarcely fail him, even in the worst of times. A few attempts of a similar kind have been made in England, but upon a limited scale, and under mistaken arrangements. At the Floral Hall, for instance, and at the Mechanics' Institute, in Leeds, working-class emulations have been seen; yet they bore an amateur and immature appearance. We regretted to find so much ingenuity and patience wasted upon elaborate patchwork quilts, representing every colour in the uniforms of the British army; tables and tea-caddies, combining a thousand pieces of wood; automaton chimes, and other monuments of devotion, illustrating a Chinese dexterity and perseverance, but not improving either the position or the capacity of the worker. At present we have no means of judging how far this or a different system has prevailed at the Agricultural Hall, but there is reason to believe that the emulation will be seriously and strictly industrial. It is to be international, as we have said. Now a great difficulty has always stood in the way of communication between the artisans of one country and those of another. The cost of travel is one obstacle. The want of a common language is another. The value of time, to people who, by daily effort, earn their daily bread, is a third. Still, as our superior working-classes will find in course of time, when more habituated to these rivalries, they are of immense, and even immediate use. We are kept out of many fields by that rarest of all sentiments—a national modesty. This point requires explanation, which we hasten to give. It is a popular idea, among us, that we can never hope to vie with the weaver of Lyons in the production of silk tissue. Why not? Lyons borrowed her cunning from Venice, buys a principal part of her machinery in Great Britain, and imports her raw material, as we do, from China, Persia, and Italy. At Paris, at Amsterdam, at Munich, at Wittenberg, at Leipsic, at Mayence, last year, specimens from the English loom were shown which by no eye could have been distinguished from the finest of French manufactures. So, too, with porcelain, with bronze, with all the fictile arts. We have been deafened out of self-respect by foreign praises of foreign wares, and have been in danger of forgetting that which in reality we ourselves have taught to half the world. Not, by any means, that we would counsel conceit or complacency on the part of our workmen when exhibiting; but a due consciousness of merit is a species of wholesome pride. Next week, no doubt, when the French and Italian artisans are among us, we shall recognise, in both, the signs of a peculiar genius, worth studying and deserving to be applauded. But, to get a true gain from a movement which, unquestionably, will grow into a European custom, we must trace for it the right direction, and point for it a practical end. In enforcement of this view we would indicate some specialities of International Exhibitions in the past. To begin with, they have not generally afforded fair play to the artisan; they have been too much dedicated to arts, to luxury, to fancy, fashion and the voluptuousness of civilisation. Then, flourishing and renowned houses, winning diplomas, gold medals, honorary mentions, and other awards, have completely drained out of sight the merit of the individual workman. What did we hear of him, the associate-artist of all the strong and beautiful elaboration, in 1851, in 1855, in 1862, in 1867, and in other years when the earth was supposed to be, in laureate language, "blessed with all the fruits of peace, and crowned with all her flowers?" This time, however, his toil, invention, and mastery over his craft, will be patent, and, while the employer will enjoy the credit of knowing a good workman, the workman can claim the credit of his own performance. This is as it should be. We shall witness greater results from a series of Working Class Exhibitions than even working men themselves are prepared for—all to their advantage, all to their elevation in the social scale. Let us refer to one episode. In 1868, the peat-cutters of the Belgian frontier—an entirely rural population, and the skilled mechanics of the Amsterdam building-yards—men utterly distinct in habits, culture and modes of thought, conceived together the idea of an International Exhibition on the banks of the Amstel. They wanted the one from the other to learn new lessons in industry and life; and, while excluding no class, they resolved that the Exhibition in the Dutch capital should principally represent their own. Their attention was given to houses and their materials, plans of dwelling-rooms, bed-rooms, kitchens, and yards; samples of mortar, cement, concrete, iron-work, and means of preventing damp, and foundations. They next considered cheap and useful furniture, and found that the world had a larger plenty for their comfort than they had imagined—seaweed for softening their beds, compressed tan to make warmth for their winters, and an infinitude of trifles, adding much, however, to the cheap facilities of their domesticity. So with clothing: they multiplied its economies for themselves. So with food: they detected eatable qualities in a thousand things hitherto despised. So, once more, with tools: they compared their own with the implements of other nations, and even learnt lessons from the flint axe of a thousand years ago. The art of life on the Continent is never lost sight of in working men's exhibitions. Nevertheless, it is perhaps true that their main and ultimate object must be the advance of the workman in his craft, and his power of triumphantly competing not only with his fellows from the Continent, but also with the necessities of his age. Much has been said and written of late concerning the importance of technical education. Mr. Samuelson, of Banbury, compiled for Parliament a very important Blue Book on this subject. In it he endeavoured to show that the British artisan was inferior in many respects to the French, the Belgian, and the German; the Russian, Spanish and Italian being *hors de concours*. Now there was a good deal of plausibility in all this. Workmen's mechanical schools, no doubt, abound more on the mainland of Europe than in these islands; but we are not aware of any failure which has been humiliating to the working class genius of England in the international competitions which have taken place. Indeed, it strikes us that this is not the real question involved. It is not whether we are outdone by rivals, but whether we might not outdo ourselves as we are, by what we are capable of being. To that result do these workmen's exhibitions tend, and in that prospect we must welcome them. The choral workman's song, sung in Dutch at Amsterdam, sets forth the idea, and, if a free translation may be pardoned, we quote from it one stanza:—

> No monster of iron, or gunpowder-fed,
> No clangour of steel, no whizzing of lead,
> Makes the blood in our arteries tingle;
> But the whirl of the wheel and the whistle of steam,
> And the bubbling hiss of the seething stream,
> Is the sound where our sympathies mingle.

Of course a Workmen's Exhibition may be intended to serve one of two purposes, or the two together. It may be designed to meet the many wants of his class which have hitherto been unprovided, or it may aim at extending his power over the materials which he has to manipulate, so that his ability shall exceed that of his rivals belonging to other nations. Or, we repeat, it may attempt both purposes. We are inclined to think that the former scheme is the more important. Taking the two, however, together, we may assign them to seven descriptions. The first is that of habitations. When the poor, herded in crowds, occupy common lodgings, mingling their wants and miseries, losing all sense of individuality and home, they become inevitably demoralized, and no work so good has been done on the Continent as that which has been done in connection with exhibitions, by teaching the industrious classes that their dwellings may be cheap and yet decent, humble and yet very comfortable. The Belgians and the Prussians are far in advance of all other nations in this respect, although the Dutch may claim a high pre-eminence on account of their model workshops. As to furniture, it may confidently be said that our working classes do not understand it at all. A Dutch or a German cottage inhabited by a family, the united earnings of which do not average 20s. a week, will exhibit a neatness, a snugness, and a completeness which we should look for in vain, as a rule, in the homes of our artisans. We should like to find some of our working class exhibitors turning their attention to the means of economising space, and securing ventilation in their abodes. In North Europe, in Sweden and Denmark, for instance, no such evil as that of foul air is ever heard of. Again, the idle time of continental workmen, apart from the Parisian, is rarely really idle. It is devoted to invention, to gardening, or to simple contrivances for the house, and that is a reason why so many more comforts are found in the Dutch or German cottage than in the English. In the matter of clothing, a great advantage possessed by the foreign artisan is that, having the raw material so much at his own door, his family have not yet given up the practice of manufacturing for him and themselves; but no doubt that is an exceptional circumstance of which we shall hear very little when capital and machinery have completed their conquests. The distaff is doomed at the first glance of the loom. It is, indeed—passing from the domestic necessities suggested by the varieties of a Working Men's Exhibition—the future control and improvement of the new forces constituting the industrial power of modern nations that is the chief object of emulation. It is the implement for fieldwork, for the workshop, for the factory, that is to be perfected; and if in our day an artisan discovers how to multiply and bring into more direct action these forces, he may win not only a medal or a mention, but a chance of fortune in its most worldly sense. We have witnessed of late years many proofs of this from among the dyke-builders of Holland, the most self-contained country in the world, China excepted; and its agriculturists and its net-makers have arisen rich firms which command the markets of Europe. The leather-dealers of Mayence, many of them not long ago only journeymen, have so profited by their skill that they have no competitors in Germany, and even supply our Australasian colonies. The opticians of Leipsic hold their ground against all comers. The Venetian glass manufacturer has his home in London—and not one of these industries exists which has not been promoted by the emulous spirit of international exhibitions. We would therefore counsel our mechanics to take these opportunities in good earnest, and to appreciate the chances they offer of general and personal advantage. The world knows too little of its workmen. Thousands of tasks finished by apt and patient hands, tender suggestions of form and colour, marks of thoughtful capacity and memorials of loving care, like that bestowed by Ascanio on his lily, abound in the workshops whence, hitherto, no name has ever issued forth to fame. It is with pleasure, then, we notice that in the forthcoming exhibition which Her Majesty has privately visited, and the Prince of Wales will open, the personal merits of the workman will be recognised. Indubitably while he demonstrates his own high quality he will perceive that he has much to learn from his fellows, and we trust, notwithstanding our denial of the idea that foreign workmen are, upon the whole, superior to ours, he may yet be so unprejudiced as to acknowledge that something may be taught to him by the Frenchman, the Dutchman, or the German. How is it that we cannot make *articles de Paris?* How is it that we are utterly beaten in toy-making by the manufactories of Nuremburg? This localisation of peculiar industries is among the most unintelligible of phenomena. A workman's exhibition brings it, however, before the workman's eye, and sets him reflecting upon his position in the great race of industrial nations. At an exhibition he can see clearly on what course, and for what prizes, he is first, second, or third, or not placed at all. We have every confidence in the prowess of our exhibitors at the Agricultural Hall, but would prefer that our mechanic should look to the exhibition less for triumph than for teaching.

STRASBURG AND RHEIMS CATHEDRALS AND THE WAR.

THE Cathedral of Strasburg has already suffered injury from the effects of the *feu d'enfer* poured upon the place; and the case may arise, nay has arisen (it has already been threatened in Strasburg), that cathedrals may be deliberately sacrificed to the necessities or vengeance of war. The greatest risk, however, of course is from misadventure and carelessness. As the *Daily Telegraph* well says:—"A stray shell may shatter to atoms the delicate lacework of Strasburg spire, or smash the magnificent stained glass of Rheims. Either of these towns may be set on fire, and, as the old S. Paul's of London attested, flames do not spare the mightiest creations of the architect. Or when the towns are bombarded at night, and when the shells are pitched half at random, the great churches may be made a mass of ruins before the besiegers find what havoc they have wrought. And whatever mischief may be done to Rheims or Strasburg is done for ever. Money and skill, it is true, might repair the rents in towers, or even cunningly imitate the soft and sombre glory of oriel window; but, after all, the result would be only patchwork and only imitation. The value of Rheims and Strasburg springs in great part from the fact that they link the present to a darkly remote past, of which they are the saintliest symbols, and of whose holiest longings they give the most vivid revelation. We prize the temples of mediæval religion, not merely because they bear the stamp of incomparable beauty, but because they wed us to the past by the tie of consecration. Their beauty we might copy; their wealth of historic association we could never produce. If Westminster Abbey were levelled to the ground we might rear a building exactly the same in form, and give it even the mellow hue of age; but the structure would not be the Abbey of history—the coronation and the resting place of our kings—the church in which is deposited the dust of the greatest among Englishmen. As the holiest symbols of a great past, the ancient cathedrals stand under the guardianship of civilization itself, and hence the whole world of educated and religious men looks with dread to the desolation which war may work at Strasburg or at Rheims."

◆

COMPETITIONS.

Bombay.—We learn from the *Bombay Gazette* that at the annual general meeting of the Mechanics' Institution, held on the 14th of August at Bombay, a gold medal, with 300 rupees from the President on behalf of the municipality, was awarded to Mr. F. W. Stevens, C.E., for his design, &c., for native baths and wash-houses. There were six other competitors for the prize. The Municipal Commissioner intends adopting Mr. Stevens's design, with a slight modification, in two or three places in Bombay. Mr. Stevens was formerly a pupil of Mr. C. E. Davis, F.S.A., of Bath.

Winchester.—It is now definitely settled (says a local paper) that the new Town-hall for Winchester is to be erected on the Globe Inn site, which is to be purchased for £1,550. The Town-hall Committee recommend that £12,000 be the sum fixed for the building. The Town Council have empowered the Committee to advertise for designs, plans, and estimates for the proposed building, and to offer a premium of £50 for the best design. It is to be an instruction to the architect that the building must include a room capable of seating 1,000 persons.

◆

SCHOOLS OF ART.

Ryde, Isle of Wight.—After many struggles and considerable expense, the committee have found the difficulties in the way of the establishment of a school of art in this town insuperable, and have determined to make no further attempt for the establishment of an art school in Ryde. The great difficulty was in the getting of a suitable building, which is a *sine qua non* with the South Kensington authorities.

Yarmouth.—Mr. J. S. Dominy, who for several years has held the position of master of the Government School of Art at Yarmouth, has obtained a more lucrative appointment at York. He has been succeeded by Mr. J. F. Ryan, from the Central School, South Kensington.

◆

ARCHÆOLOGICAL.

North Oxfordshire Archæological Society.—The North Oxfordshire Archæological Society has just visited Burford, whose fine old church is now being restored under the superintendence of Mr. G. E. Street, A.R.A. The church is dedicated to S. John the Baptist. Its chancel and nave are of great length, with tower between and transepts on either side, with several large chapels grouping around, and it has a large-chambered porch. Its architecture is chiefly Perpendicular, but in parts it is Norman and Early English. The lantern and west door are Norman, and the porch on the south is Late Perpendicular, and of exquisite details. After inspecting the church, some of the party went to the bridge and thence to the Priory. After dinner a paper on the Priory was read by the Rev. J. H. Burgess, vicar of Burford.

Archæological Excursion to the Herefordshire Beacon.—The Archæological Section of the Midland Institute have arranged for an excursion to the camps on the Herefordshire Beacon and Midsummer Hill, Malvern Hills, on Monday, the 12th instant. A Midland train will leave New Street Station at nine a. m., arriving at Malvern Wells about eleven a. m. From thence the members of the section will walk to the Beacon Camp, a distance of about three miles. Luncheon will be provided on the hill about one o'clock, after which Mr. H. H. Lines, of Worcester, will conduct the members of the section over the camps, and will read a paper describing them. Dinner will be provided at Malvern at six o'clock, and the members will return to Birmingham by the train leaving at eight p.m.

Roman Millstones.—Mr. Blair, an antiquary residing at Oundle, has lately been in possession of a pair of Roman millstones which were recently discovered in Car Dyke, between Eye and Peterboro', by men who were digging for water for cattle. They were upper and nether stones, weighing from 40lbs. to 50lbs., and were formed of a sort of lava stone. One was perfect, and the other was fractured so as to be easily joined. They have been sent to the Northampton Museum.

Opening of Tumuli in Northumberland.—The Rev. Canon Greenwell, of Durham, and Mr. C. H. Cadogan, of Brenkburn Priory, Northumberland, have completed the examination of three tumuli situate upon the Harbottle Castle estate (the property of Mr. P. Clennell), Northumberland. The first tumulus was a cairn of stones, 32 feet diameter and 2 feet high, but some stones had been removed. There was a circle of large stones round the base. At 7½ft. east from the centre there was found a deposit of burnt human bones on the natural surface, in a heap rather over a foot in diameter. At 3ft. S.E. by S. from the centre, and 9in. above the natural surface was another similar deposit, and immediately below it, and upon the old surface, was a third, very much burnt, the bones few in number, but evidently those of a separate burial. At 5ft. N.W. of the centre was a large stone, naturally present, and deeply fixed in the ground. From this stone the cairn had been commenced, the other stones being laid against it, as from a centre—all flat stones set on edge—and the second deposit of burnt bones was just beyond these stones. The second barrow was 24ft. diameter and 3½ feet high—a cairn perfectly undisturbed. At 4ft. S.S.E. from the centre was a deposit of burnt bones 8in. above the natural surface. At 5½ft. S.S.E. from the centre, in a hole sunk one foot into the ground, was another burnt burial, the body having been burnt upon the spot. At the centre was a cist of four stones on edge, with a cover filled with fine sand. At the east corner of the cist was a "food vessel" on its side, with mouth to the south, and facing a hollow to be presently mentioned. At the south-east end were some burnt bones and charcoal, but the cist probably contained an unburnt body. At the south corner of the cist was a hollow, as if the remains of the impression made by the skull. The "food vessel" is flower-pot shaped, and in perfect condition, and is ornamented externally with lines arranged herring-bone fashion with horizontal rows of dots between. The third barrow was 24ft. diameter and 3ft. high, made of stones. At 8ft. S.E. of centre was a burnt burial in a hole lined with flat slabs of shaly limestone, and at the bottom two sandstone slabs, and on the top two covers and a large stone over all. The burial urn contained the remains of two or more bodies. At 8ft. E.S.E. from the centre was a deposit of burnt bones on the natural surface of the ground. At 5ft. E. by S. from centre was a small plain urn, upright, with much charcoal about it, and between this urn and the hollow there was much sign of burning. At 4ft. S. of the centre was another burnt burial, two pieces of flint being among the bones, one part of a "scraper," and part of a bone pin, burnt also. Just S.E. of the bones and a little above them was a large urn, upright, enclosing a smaller urn. The large urn had a reticulated pattern of thong markings. At the centre of the barrow was a burnt body and another urn, and two flints. The pottery obtained is of great interest.

◆

Building Intelligence.

CHURCHES AND CHAPELS.

Barton-le-Street.—The ancient Norman church of Barton-le-Street, near Malton, dedicated to S. Michael, had become so ruinous through length of years and neglect, that its repair became hopeless, and Mr. Meynell Ingram, of Temple Newsam, the proprietor of the parish, has determined to rebuild it as a memorial to his deceased father. Messrs. Perkin and Son, of Leeds, were employed to prepare the necessary plans, and the work was let, Mr. John Thornton, of Slingsby, being employed as mason, and Mr. John Tomlinson, of Leeds, undertaking the carpenters' and other work. The sculpture is entrusted to Messrs. Maw and Ingle, of Leeds. The whole work is being executed under the persona supervision of Mr. Isaac Newton, the clerk of the works. The new church is of good proportions. There is a fine Norman porch on the north side and a vestry abuts on the chancel on the south side. The interior dimensions of the nave are 54ft. 6in. by 20ft. 6in. The chancel is 20ft. 6in by 16ft. 6in. The bell turret at the extreme wes end of the church will be 50ft. high, and sur mounted by a Norman cross. The porch is very rich in Norman sculpture, principally old work. The exterior walls of the nave and chancel are strictly Norman in their style, and in the interior a very large amount of ancient carving is introduced in the string-courses, the window moulds, and other parts, and the wall plates are supported by ancient corbels. The old chancel arch had been destroyed, but the new one is very rich, and is strictly worked from remnants of old work found in the church. The windows throughout are circular-headed. About three hundred ancient stones, richly carved, are worked into the new structure, and the new sculpture is adapted, as far as possible, to the old style. The nave is to be covered with thirty-two ribs of red wood, cleaned and moulded, the intervening spaces being filled in with boarding. The form of the roof in the interior will be circular. The chancel will be roofed in the interior with oak ribs, in panel work, richly carved. The stone used for the building is from the Whitby and Appleton quarries.

Dundee. — The Restoration of the Old Steeple.—Mr. Gilbert Scott, who lately inspected the Old Tower, Dundee, with a view to its restoration, has forwarded a report on the subject to the local committee. Mr. Scott supposes the tower to date from the close of the fourteenth century, when Scottish architecture assumed a very distinctive and national form. He is of the opinion that the original termination of the tower was after that of S. Giles', Edinburgh, the resemblance of the upper stages of the two towers being most marked. The Dundee tower, however, was much the best in design, which led him to think that at Edinburgh must have been of a little later date, and imitated from it. He was unable to discover when the original termination was removed, and the present uncouth house substituted. The house, he supposed, was erected as a watch-house in the time of Henry VIII. or Edward VI. The tower, as a whole, he said, was in a substantial condition, but externally it was much decayed. After referring to various details in regard to restoration, Mr. Scott concluded his report by recommending the employment of a thoroughly practical mason and an efficient clerk of works to undertake the necessary work. The cost of restoration would be at least £5,000, and possibly might exceed that sum. It is calculated that £3,300 has been subscribed; and if this is found to be the case, operations at the tower will be immediately begun.

Fenton Chapel.—The cost of erecting this chapel was not £4,000 as mentioned last week, but £2,640.

Gloucester Cathedral Restoration.—The restoration of Gloucester Cathedral has now been carried out, under the supervision of Mr. Gilbert Scott, on as large a scale as the funds will permit. The south porch has been nearly completed; the rich front of tabernacle work has been faithfully reproduced, and niches for statues, with beautifully carved canopies, have taken the place of the modern dial. Mr. Redfern, of London, is carving 14 statues for the porch. The aisles of the choir have been carefully cleaned and repaired, S. Andrew's chapel has been finished for some time, S. Paul's chapel is being completed, and the renovation of some of the other chapels is in a forward state. The magnificent roof of the choir has been coloured by Messrs. Clayton and Bell. Messrs. Farmer and Brindley, of London, have undertaken the carving of the woodwork of the choir; and Mr. Scott will proceed with the restoration of the sedilia, and prepare plans for the reredos, for which the Freemasons of the Province have subscribed £650. The south transept is nearly ready for the stained glass in its great south window, and the repair of the north transept has been begun. The estimated cost of the whole work is £45,000, whereas the total amount paid and promised up to the present time, even including £5,000 given by the Dean and Chapter, is only £14,157. Already some £6,000 has been expended, while estimates accepted for the choir and south porch exceed £4,000 more.

Jarrow.—On Monday afternoon the foundation stone of a new Wesleyan Methodist chapel and school was laid near the new railway station to be erected at Jarrow. The plans have been made by Mr. F. R. N. Haswell, North Shields, in the Italian style, the chapel to be built of brick with stone dressings. The building is calculated to accommodate from 800 to 900 persons. The estimated cost is about £3,000.

Little Cowarne.—The parish church of Little Cowarne was re-opened on Tuesday week, after restoration under the superintendence of Mr. F. R. Kempson, architect, Hereford. The work of restoration has comprised the entire re-building of the east and south walls of the chancel and the re-building in part of the south wall of the nave; the opening out of the chancel, which was formerly separated from the nave by a very small and insignificant arch; and the substitution in place of the latter of a lofty and handsome arch nearly the entire width of the chancel. The tower has also been thrown open to the nave, and has been raised 10ft. The work has been carried out by Messrs. Morris and Bufton, of Ocle Pitchard, at a cost of £500.

Little Marcle.—The new church of S. Michael, Little Marcle, was consecrated last week. The church is in the Geometrical style, and comprises nave, chancel, north porch, and vestry on the south side. The material used is native red sandstone, with Bath stone dressings. The roofs are covered with Broseley tiles. The whole of the work has been substantially executed by Messrs. Wall & Hook, contractors, of Brinscombe, near Stroud, from plans by Mr. J. W. Hugall, architect, Oxford.

Llanerfyl, Montgomeryshire.—The parish church of S. Erfyl has been re-opened, having been re-built on the old site. The new church consists of nave and chancel, western bell turret, vestry and south porch. The old nave roof has been restored and refixed, and the font repaired and provided with a cover. Local stone has been used for the walling, and shelvoke for dressings. The open seats are of pitch pine ;the chancel stalls, pulpit, lectern and other fitings of oak from the old church. Messrs. Maw & Co. have supplied the encaustic and enamelled tiles for the reredos and floor within altar rail. The single light window in the west gable is filled with painted glass by Messrs. Done and Davies. There is provision in the new church for about 200 persons. The total cost of the building is £1,500, and the work has been carried out by Mr. Morgan, of Llanfair Caereinion, from the designs of Mr. E. Haycock, junr., architect, Shrewsbury.

Munslow.—The church of S. Michael, Munslow, Salop, was re-opened on the 19th ult. by the Bishop of Hereford, after restoration. The church, which consists of tower, nave, north aisle and chancel, is of very ancient date, and of various styles of architecture. The interior of the old church was much disfigured by a ceiled roof, an unsightly gallery, and high pews; these have all been removed. The new pews are of oak, with carved heads of old wainscoat oak. The removal of the west gallery disclosed a fine old Norman arch, formerly hidden, and opens a view of the full length of the edifice. By the removal of the gallery is also gained a good view of a memorial window of stained glass (by Done and Davies, of Shrewsbury), the gift of the architect, Mr. S. Pountney Smith. The walls of the church, and the pillars and arches of the arcade, have been scraped, and the plaster which disfigured them has been removed. In removing the thick coat of plaster from the chancel end of the south wall, a staircase, leading to the old rood-loft, was brought to light, and is now fitted with oak doors with ornamental hinges and ring handles. The church has been re-roofed, but the character of the old roof has been retained, and the massive old beams, side-pieces, and principals replaced. The church has been laid throughout with encaustic tiles, by Mr. Bathurst, of Broseley. The old wooden pulpit has been removed, and a stone pulpit by Mr. John Cross, of Shrewsbury erected in its place.

Newark, New Jersey, U.S.—The Right Rev. Dr. Bayley, of Newark, U.S., has lately visited London to consult Mr. Goldie upon the proposed cathedral and Bishop's residence to be erected at Newark, from the designs of that gentleman, in connection with his partners Mr. Child and Mr. O'Rourke, of Newark. The cathedral is to be dedicated to Our Blessed Lady and S. Patrick, and is to be erected in the earlier and purest form of mediæval architecture, of which Mr. Goldie has already raised up such striking specimens in the pro-cathedrals of Westminster and Beverley. The plan will be that of a perfect cathedral, vast nave and aisles with flanking chapels, two western towers, and spires with the mortuary and baptistry chapels in the basements, and a noble atrium, or porch, stretching across the whole width of the nave between them; transepts with apsidal chapels, and a choir with aisle making its entire circuit, and giving access to the Lady Chapel at the extreme end of the cathedral. The total length of the church will be over 300ft, the width of transepts being 120ft., and the lofty spires will rise to a height of nearly 300ft. The local materials, freestone and brick, will be employed, and probably polished granite for the shafts. The bishop's house will be attached to the cathedral by a cloister, and will be commenced early next spring, and the foundation stone of the cathedral will be laid soon after.

Ripon.—The foundation stone of a new Congregational Church at Ripon, was laid on Friday last. The church will have a tower and spire at the south-west corner, 100ft. high, and will afford sitting accommodation for 600 adults. Mr. J. P. Pritchett, F.R.I.B.A., of Darlington, is the architect, and the cost, including schools and a minister's house (which will adjoin the church), will be £3,000.

Silksworth.—On Wednesday week the corner stone of a new church, to be dedicated to S. Matthew, at Silksworth Colliery, near Sunderland, was laid by the Countess Vane. The new church, which is situate midway between the village of Silksworth and the colliery, will be of Early English Gothic character, built of limestone, with freestone dressings; to contain free sittings to the number of 250, and to cost £1,800.

Tyldesley.—A new Congregational Church, in High-street, Tyldesley, was opened on Wednesday week. The church is of brick, with polished stone dressings, and is Gothic in style. Sittings are provided for 550 persons. Beneath the church are schools for 400 children. Mr. Atherton, of Bolton, is the architect. The entire cost is about £2,200.

BUILDINGS.

Birmingham.—New lodging-houses for working men have been fitted up in Summer-lane, Birmingham, and will be ready for occupation on Monday next. The premises have been adapted to their new purpose by Mr. Jas. Williams, architect, New-street; and are under the superintendence of Mr. T. Brown, who has had long experience in the management of lodging-houses.

Bolton.—The old Wesleyan School, in Moss-street, Bolton, has been pulled down, to make way for more commodious school buildings, from plans by Mr. T. Ormrod, architect, of Nelson-square, Bolton. The foundation stone will be laid to-morrow (Saturday).

Clifton.—A new library has just been added to Clifton College, by the munificence of the Rev. John Percival, the head-master. It is from the designs of Mr. C. F. Hansom, the College architect, and consists of two floors, the ground one being devoted to a couple of class-rooms, about 23ft. square. Over the class-rooms is the library, which consists at present of four bays, 49ft. by 23ft., but will eventually be carried on to a fifth, now used as a temporary office for the secretary, and will then be 62ft. long. This will be fitted up with bookshelves running out at right angles from the walls, and dividing each bay into separate compartments. The principal architectural feature is an elegant open timber roof, with hammer-beam principals, supported on wooden columns with moulded capitals and bases. The general contractors for the work were Messrs. Wilkins & Sons.

Halifax.—Stannary Congregational Church Schools.—The above schools have just been satisfactorily completed. The style adopted is Gothic, severe in character, and apparently designed for stability and convenience. It is so arranged as to answer admirably the joint purpose of a chapel and school, pending the erection of a new Congregational church on the site adjoining, when the large room now devoted to public worship will be used as a school-room only. The ground floor is divided into class-rooms, ten in number, which range down either side of a central corridor leading from a spacious hall, and connecting the front and back staircases. A chapel-keeper's house is also provided for on this and the basement floor. The first floor is approached from the hall by a good wide stone staircase at the west end. There is also a staircase at the east end, intended principally for ministers and choir. The large room, with its galleries and vestries, occupies the whole of the first floor, and is 85ft. 6in. by 42ft. in the clear. It is light, lofty, and well ventilated, and is spanned by an arched-principal hammer-beam roof, rising to the clear height of 38ft. to the underside of the collar, and is a remarkably fine specimen of its kind. The minister's platform and gallery front are executed in pitch pine, and are of a very bold and elaborate character. The large room, class-rooms, &c., are effectually heated by hot-water apparatus, supplied by Messrs. W. & S. Thornton, of Huddersfield. The large room, exclusive of vestries, will accommodate 750 adults, and the class-rooms below will seat 540 scholars with comfort. The contractors are all local, and the building, which has been erected at a total cost of £3,750, has been carried out from the designs and under the superintendence of Messrs. Horsfall, Wardle, & Patchetts, architects, Halifax.

Market Drayton.—New premises for the Manchester and Liverpool District Banking Company have just been erected in Cheshire-street, Market Drayton. The building is Gothic in character, substantially built of a red stone and yellowish brick, and is seen from all sides. Great care has been taken by the architects in designing the building to have each front equally good in detail. The building is two stories high, covered by a high-pitched slated roof, with ornamental finials. The banking-room is 33ft. long by 24ft. wide, the counters and desks being specially designed to accord with the style of architecture of the building. Messrs. Swindells & Little, of Manchester, have been the contractors, and Mr. Harrison, clerk of the works; Mr. Fox, of Market Drayton, has done the plumbing, glazing, and gas-fitting. Messrs. Barker & Ellis, of Manchester, are the architects.

Nottingham.—The theatre at Nottingham, a plan of which we illustrated some time since, has, since June 24, undergone a thorough renovation. The massive pillars of the proscenium have been removed, and the whole design of that part altered and improved, and small private boxes built at the sides of the balcony circle. This has wonderfully improved the interior, which, in every other respect, has been proved to be as complete as could be wished. The new work has been decorated by Mr. George Gordon, of London, who has also painted a new act-drop. The decoration of the fronts of the various tiers, the ceiling, and Mr. Holliday's charming frieze, have been carefully cleaned, and the small running ornament painted on the mouldings and cornices freshened by a little stronger colour. Some spacious refreshment and supper-rooms have been built, in addition to those in the theatre previously. The builders' work has been done by Mr. Wright, of Nottingham, and the whole has been designed and superintended by the architect of the theatre, Mr. C. J. Phipps, F.S.A., of London, the cost being about £1,500.

Sheffield.—The Duke of Norfolk laid the corner-stone of a new music hall at Sheffield on Thursday week. The architecture of the building will be Italian in character, and the interior will be elaborately decorated. Accommodation will be provided for from 2,500 to 3,000 persons.

South Shields.—On Wednesday week Earl Percy laid the foundation stone of S. Peter's National Church Schools, South Shields. The buildings will comprise boys' school, 46ft. by 20ft., girls' school, 44ft. by 20ft., with convenient class-rooms and a covered playground, and will be capable of accommodating 300 scholars. The contract, amounting to £1,513, is in the hands of Messrs. Sopwith & Kent, of North Shields; the designs having been prepared by Mr. F. R. N. Haswell, architect, of that town.

Staveley.—The Midland Railway Company has just erected a new locomotive shed near the Staveley Station. It is a very commodious building, capable of holding twenty-four large locomotives, and the tanks, mess-room, and offices adjoining are conveniently arranged. Mr. J. E. Hall, of Nottingham, was the contractor, and the cost has been £20,000.

◆

The Grand Prize of Rome.—The "Death of Messalina" was the subject given in competition for the Grand Prize of Rome this year. The winner is described as not 20 years of age; he is a pupil of M. Cabanel. The inferior honours of this class are due to Mathieu, another pupil of M. Cabanel. "Samson with the Lions" was the subject of the competition for the prize in sculpture. M. A. E. Charles was successful. M. A, Jacquet won the prize for engraving, and M. Thomas that for an architectural design of a school of medicine.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

To Our Readers.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office not later than 5 p.m on Thursday.

W. Mc E., D. J. W., J. C. J., A. G. H., J. H., M. V. and M., J. H. R., J. H., J. N., J. P. S., C. B. A., S. and Son, J. M. G., H. G.

J. W. T.—See article this week on "Hand-railing," which will be followed by several others.

S. O.—Please send view and plan.

J. T. M.—Drawing returned. Too many sketches of Norman doorways sent before.

S., Son, and R.—Plan of mansion to hand.

J. C., Jun., must take the slight responsibility, if there be any.

A Subscriber for Fifteen Years.—Apply to the Turkish Embassy, 1, Bryanston-square, London.

C. A. J.—The sketches will be returned.

Correspondence.

ARCHITECTS' CHARGES.

(*To the Editor of the* Building News.)

Sir,—I had a case about nine months ago similar to that mentioned by "Young Architect." A freeholder wished to have a cottage built on a portion of his ground, and applied to me to prepare him some designs for his choice, cost not to exceed £200. I, expecting to do the job, sent him three plans and elevations in different styles, with approximate estimates for each. He replied, thanking me for the designs, and stating that he had already engaged another builder. I sent him in a bill for two per cent. of the total cost of the three, and took proceedings in the county court, and obtained judgment for one per cent. I shall be happy to furnish your correspondent with further detailed information.—I am, &c.

Country Builder.

Sir,—It were almost amusing, if it were not painful, to read such inquiries as that of "A Young Architect" in yours of this day, To read such, one might suppose we were living in Timbuctoo or New Caledonia, instead of in a country where, more than in any other, law and order are maintained. The law of England guarantees to every subject fair payment for honest work, and, therefore, if his client will not give him that, I advise, as the result of my experience, that he lose no time parleying, offering references, &c., but issue a writ forthwith. The client will then be compelled within twelve days either to pay the amount in full, or as much as he admits due, or else to show good cause for withholding payment. Of course the architect should do this through some respectable solicitor.

The Institute scale will inform him fully what he has a right to charge; and though for a long time it was pretended that this scale "would not be recognised, could not be enforced," &c., recent cases, and in particular the case of "Ebdy *v.* McGowan," reported in your columns, have shown that, when properly proved, the courts will regard this document as binding and authoritative, and direct verdicts in accordance with it.

If he takes firm and decisive action, the client will probably "cave in" at once, unless he be peculiarly obstinate or ill-advised. Young architects are often told "they ought on no account to go to law, &c." And certainly neither they nor anybody else should do so rashly or unnecessarily. But if people will not pay on one or two civil requests, what else are you to do? How would my tailor or your printer act if their claims were not duly honoured?—I am, &c.

Wm. Fogerty.

8, Buckingham-street, Strand, Sept. 2.

ARCHITECTURAL CUSTOM.

Sir,—Would you kindly inform me if it is a custom in the architectural profession for an employer to dismiss an assistant with a month's notice after a twelvemonths' engagement has been entered into. An answer to the above query through course of post will greatly oblige a constant reader of your valuable paper.—I am, &c.,

John Y. M'Intosh.

Birmingham, Aug. 31.

Intercommunication.

◆

QUESTIONS.

[1938] TURKISH BATHS.—Can any one inform me if there is any work published, and by whom, how to construct a Turkish bath, or who would be likely to supply working details for the construction of one?—John Scott.

[1939] COTTAGE HOSPITAL.—Can you or some of your readers give me a description of a cottage hospital?—X. Z.

[1940] BREACH OF CONTRACT.—A vicarage being to let I was asked by a mason to tender for the carpenters' and joiners' work on the understanding (verbal, but with witness) that if he got the contract I was to do the above work. He got the contract and appointed a time when I was to sign the agreement, but previous to the signature he informed me that the plans and specifications not being to hand we must wait until their arrival. Subsequently he let the work to another firm of carpenters and joiners. Can you or any of your correspondents say if any, and what compensation I can recover against him? I expected to have made about 8 or 10 per cent. by the job.—G. W.

[1941] ORNAMENTAL INLAY.—In the Building News for December 10, 1869, directions are given for ornamental inlay. I have tried the molten lead poured into letters cut in marble, but the heat of the lead causes the marble to burst; the centres of the letters O and A are all burst out. Would some reader oblige me by describing the method? Can the lead be softened so as not to require so much heat to melt it?—A Mason.

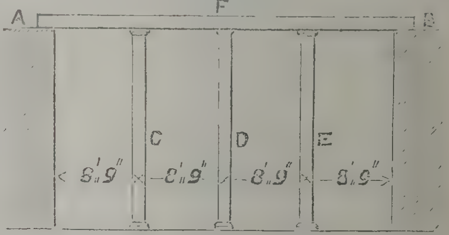
P.S.—What is "colophony?"

[1942] REMOVING WHITEWASH.—Will you oblige a four years' subscriber by inquiring through your "Intercommunication" column the most effectual way of removing old whitewash from the face of stonework, especially from the small holes made by the mason's pick when dressing?—Foreman.

[1943] WALL BUILDING.—Will some of your "practical" readers be kind enough to tell me if a hollow wall constructed 4½in. on face. 2½in. cavity, and 9in. brickwork internally, is in accordance with the proper construction of such walls, and what ties should be used?—B. F.

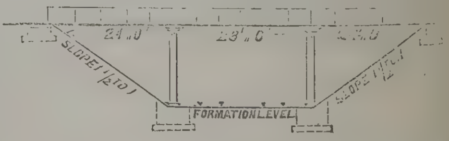
REPLIES.

[1921] LOAD ON IRON COLUMNS.—The question raised by "Student," in "Intercommunication" column, is apparently difficult, but in reality very simple, provided it is commenced properly. The only point to be determined is the distribution of the load, and the manner in which it affects the columns. It has not been stated by "Student" at what distances apart the three columns are placed, but there is no doubt that the whole space of 35ft. is equally subdivided, as represented in the sketch I have given. The total load carried by the bressummer will consist of the front wall of the building, half the weight of the floors of the front rooms, and half the weight of the roof, and this load will be divided among the columns as follows. In the first place let us take the distance along the bressummer from A to the first column C. Manifestly half of the load situated on this part will be supported by the wall at A, and half by the pillar C. Similarly, half of the weight situated between the columns C and D, or between any two of them, will be borne by each respectively. But the distance between the pillars, measuring of course from centre to centre, is 8ft. 9in., or a quarter of the whole span from wall to wall. Each pillar carries therefore a quarter of the load, and if we call this W, the distribution is $\frac{W}{8}$ at the walls A and B, and $\frac{W}{4}$ at each of the three pillars. The actual load must of course depend upon the height of the wall, and the character of the building, but "Student" will now have no difficulty is calculating the strength of the columns. Let him bear in mind that his load upon the columns must not be greater than one-sixth of the breaking weight for cast-iron.—T. C.



[1924] ASPHALTING.—From experience I can inform your correspondent that amateur asphalting always comes to grief, especially when performed upon a scale so large as he mentions. His best plan is to get the Pyrimont Seyssell people to lay down what he requires, and he will have a good job made of it once for all.—S. K. P.

[1926] CARRYING A STREAM OVER A RAILWAY.—The simplest means of taking any water over a railway is to make the bridge act as the aqueduct as well. This is the manner in which the main drainage is taken across



the Great Eastern Railway near Abbey Mills pumping station. I have given, for the information of "Contractor," a sketch showing the arrangement. There is no necessity for placing columns in the middle of the "six-foot," as the span is comparatively small. The girders should be of the plate form, and the riveting and joints done very carefully, as the work must be watertight.—Engineer.

[1927] PILEDRIVING.—"Balk" should place a piece of wood on the head of the cast-iron piles, and he will be then able to drive them without their breaking off short. From the circumstances of the case I am inclined to think that screw piles would have been the proper things to use. The driving of cast-iron piles is always precarious work.—L. M. N.

[1928] TESTING CAST-IRON—It would scarcely be possible in testing small specimens of cast-iron to observe the deflection without the aid of delicate and expensively constructed instruments. The best plan will be decidedly to break them by either an actual weight at the centre, or by help of a lever. The approximate breaking weight can be readily calculated from the equation $W = \frac{A \times D \times C}{L}$, in which W is the breaking weight at the centre, A the area in square inches of the bottom flange of the girder, D the depth, and C, a constant equal to 26, and L the span between bearings. It must be borne in mind that D and L must both be in feet or in inches.—Calculus.

[1932] SKETCHING IN THE TOWER.—For permission to sketch generally apply to the Constable, F.M. Sir T. F. Burgoyne, 8, Gloucester-terrace, Bayswater, W.; for admission to the armouries, to the Secretary of State for War, War Office, Pall Mall, S.W.; and to the Hall Tower, to the Lord Chamberlain, Lord Chamberlain's office, Stable-yard, S. James' Palace, S.W. A fair amount of work may be picked up in the subsidiary towers, but scarcely anything beyond thick walls to be got out of the keep.—C. S. W.

LEGAL INTELLIGENCE.

Important Decision under the "Building Act."—Mr. Abraham Cohen, builder, of Southgate-road North, on Wednesday week appeared to a summons at the Lambeth Police Court for refusing to pay £2 1s. 3d. due to Mr. C. A. Long, the district surveyor for S. Mary, Newington, and part of Lambeth. Mr. Long said he surveyed the alterations made to the Jewish Synagogue, Walworth-road; but although he sent several times to defendant, he refused to pay the amount of fees. Defendant said there had really been no additions or alterations to the building within the meaning of the Act. Before the building was completed it was found that the roof was too heavy, and caused the walls to bulge. In consequence, three buttresses were built. Those matters were, he contended, necessary repairs, and did not entitle Mr. Long to the fees. The magistrate said, according to defendant's own version, it was clearly an alteration to the building, and not a repair, as meant by section 9 of the Act. Mr. Long said that section referred to necessary repairs, and nothing affecting external or party walls. The roof was found to be not sufficiently strong, and extra supports had to be put in. The walls bulged so dangerously that brick buttresses were obliged to be erected, and iron rods inserted to tie the work together. The magistrate said it was quite clear the case for the complainant had been made out, and he should make the order for payment of the amount, with 2s. costs.

A Builder Committed for Manslaughter.—Mr. George Hall, builder, of Hardingstone, Northampton, was last week committed on a coroner's warrant to take his trial for the manslaughter of William Hill, a mason's labourer. Mr. Hall was engaged in repairing a house in the Kingsthorpe-road, and a large hole or opening, giving access to a flight of stairs leading to a cellar, was left unprotected, and the plaintiff, in going to fetch his tool-basket, fell into the hole and fractured his skull. The jury, on the evidence adduced at the inquest, returned the following verdict:—"The jury are of opinion that the deceased came by his death through the negligence of Mr. Hall in not properly securing the hole." The coroner remarked that the verdict was tantamount to a verdict of manslaughter against Mr. Hall. He thought it proper, under the circumstances, that the case should go before another tribunal.

WATER SUPPLY AND SANITARY MATTERS.

Brighton.—At a meeting of the Brighton Sewers Board on Tuesday last, a communication was read from Mr. Hawkshaw, C.E., offering to undertake the superintendence of the work, and prepare drawings and specifications, for £4,000, being 5 per cent. upon his estimated cost of the work. The offer was accepted.

Castle Northwich.—New water works have been erected for this increasing township near Moss Hall Farm consisting of a well 6ft. in diameter, which has been sunk to a depth of 32ft. and indicates every appearance of yielding an ample supply of pure water. In the engine house which has been built over the well is a high pressure horizontal engine, which lifts the water into a water tower built on the high ground near the Wimington Branch Railway, the lift being 115ft. The tower is circular, and 48ft. in height. On the top is a wrought-iron tank, 25ft. in diameter, and 10ft. 6in. in depth, and contains, when full, 32,000 gallons of water, or an estimated supply of a day and a half. The contractors for the several works were Mr. C. Shaw, of Castle, for the erection of the tower, engine, and boiler house and chimney; Messrs. Milburn and Sons, of Staleybridge, for cast-iron pipes and tank; Mr. E. Sharp, of Lancaster, for valves and hydrants; Mr. J. Nutton, of Elland, for laying pipes; and Messrs. Holdford and Shepherd, of Hyde, for the engine and boiler. The works were designed and carried out by Mr. Henry Bancroft, C.E., of Manchester.

Darlington.—The Darlington Town Council met on Thursday week, when the town clerk read a letter he had written to the Home Secretary, urging that the council could not decide immediately as to the best means for the disposal of the sewage otherwise than by running it into the Skerne and the Tees in the present unsettled state of the question. The Secretary of State, on the 22nd of August, replied that the plea urged for delay could not again be entertained, and called upon the council to prepare a complete scheme for applying the system of sewage irrigation before Oct. 31st, or, failing to do so, he would appoint some competent person to carry out the work. It was agreed to refer the matter to a committee to meet without delay. The Commissioners for the Polution of Rivers intimated, in a letter read from the town clerk, that they would attend at Darlington to examine into the condition of the Tees and the Skerne at the commencement of October.

Jersey.—Dr. Lankester has been spending his holiday in Jersey; and, finding the sanitary condition of that beautiful island far from what it is represented to be, he has liberally given the inhabitants a lecture, which was attended by the Governor and principal inhabitants. Jersey ought to be the healthiest place in the kingdom; but its average deathrate is 22 per 1,000, equal to that of London; while among the 29,000 inhabitants of S. Helier the death-rate has reached the high figure of 26 per 1,000. The water-supply from wells seems to be scanty and defiled.

Rugby.—An important sanitary experiment is being carried out at Rugby. The whole of the sewage of the town, of which part formerly polluted the Avon, is now used for irrigating the fields. It is stated, in a recent special report to the Privy Council by Dr. Buchanan, that the health of the children living in the midst of the irrigated districts, far from suffering, has actually improved.

STAINED GLASS.

Westhoughton.—A stained glass window has just been placed in the chancel of the new church at Westhoughton, to commemorate the munificence of Mr. John Seddon in rebuilding the church. The window, which is in five lights, is by Messrs. Clayton and Bell. The subject is the Te Deum. In the base of the central light is represented "Our Lord Crucified," and above is "Our Lord in glory, sitting at the right hand of God." The side lights are filled up with representations of apostles, prophets, martyrs, and "the holy church throughout the world." The wheel light in the pediment is filled with an emblematical representation of the Holy Ghost—the Dove—round which are angels, and on each side the cherubim and seraphim. Beneath the window is an inscription.

STATUES, MEMORIALS, ETC.

Liverpool.—The equestrian statue of the Queen to be erected by the Corporation in front of St. George's Hall is completed, and in a few days will arrive from the bronze foundry of Messrs. Elkington and Co., of Birmingham, by whom it has been cast. It will be remembered that shortly after the erection of the statue of the late Prince Consort which now adorns the southern extremity of the open space fronting the hall, the Corporation resolved to erect a companion statue of the Queen, at a cost of £5,000. Mr. Thorneycroft was the artist approved by her Majesty for the execution of the work. The granite pedestal on which the statue will rest has long been finished.

Our Office Table.

The Alexandra Palace and Park.—A third, and let us hope a more fortunate attempt, is about to be made to open the Alexandra Palace and Park to the people of North London. The effort is being organised by Mr. Francis Fuller, of Whitehall Gardens. It is proposed to form a company for this purpose on the Tontine principle, with a capital of £650,000, in fully paid-up shares, of 20s. each, with power to issue debentures bearing interest at 5 per cent. per annum, to the amount of £150,000 if necessary. The shareholders first registered up to the amount of £500,000 will be those alone entitled to the ownership of park, palace, and contents, which it is estimated will be worth, at the close of the Tontine in 1880, about one million and a half sterling.

The Great Western Railway.—The line between the Hammersmith Junction and the Westbourne Junction is being considerably widened in order to keep the main-line traffic distinct from that of the Hammersmith and City traffic. A station, to be called the Harrow-road Station, is contemplated in the garden of Mr. F. G. Saunders, the secretary of the company. The alteration of the gauge from the broad to the narrow has just been effectually completed on the Wycombe branch, and the local service of that line will be carried over the narrow gauge to and from London.

The Whitworth Scholarships.—The practical examinations for the Whitworth scholarships were commenced on Tuesday week and finished on Friday last, at the works of Sir Joseph Whitworth & Co., Manchester. There were 33 candidates, all of whom had previously qualified by passing in the theoretical examinations of the Science and Art Department. They were examined in the handicrafts of turning, fitting, and pattern-making, and in the use of the various classes of mechanical tools. The results of the examination were inspected by Sir Joseph Whitworth, Mr. E. J. Reed, late chief constructor of the Navy; Professor Greenwood, principal of Owens College; Mr. M. Kirtley, locomotive superintendent of the Midland Railway Company; Mr. Wright, chief engineer of the Navy; Mr. Manby, secretary of the Institute of Civil Engineers; and other gentlemen. The results of the examinations will be ascertained, and the names of the successful candidates made known in the course of a few days.

Improvement of the Thames Navigation.—The extensive and important works undertaken by the Thames Conservators in the re-construction of a new lock below Windsor Bridge, are completed. The work is very substantial, and has been carried out at considerable expense, towards which the Crown contributed £2,000, as it will tend to prevent the flooding of the Home Park.

Windsor Branch of the Amalgamated Society of Carpenters and Joiners.—The members and friends of the Windsor Branch of the Amalgamated Society of Carpenters and Joiners held their fifth anniversary on Tuesday week. From a statement read by Mr. Lawton, it appeared that the income of the Branch during the past year had amounted to £318 3s. 11d., and the expenditure—the principal items in which were:—donations and travellers, £47 7s. 8d.; tool benefit, £11 9s. 11½d.; sick benefit, £32 13s. 8d.; remitted to other branches, £119—showed a total of £257 5s. 1d., leaving a balance in hand of £60 18s. 10d.

American Railway Items.—The greatest year for railway construction in the United States was 1869, in which 5,000 miles were laid. The next year to it, in rank, was 1856, in which 3,640 miles were constructed. The 5,000 miles of road constructed during the last year cost 150,000,000 dols., or about 30,000 dols. per mile. Massachusetts has the most railways in proportion to its superficies and its population. It contains 1,489 miles of iron road on a surface of 7,800 square miles, or about 100 miles to every 526 square miles of territory. Were all the railways in that State laid down in parallel lines they would be but 5¼ miles apart, and were the entire territory of the Union as closely marked with railways as Massachusetts it would contain 600,000 miles of iron track. The new depot of the Hudson River and Harlem, in New York, will be a magnificent affair in size as well as finish. It is built chiefly of iron and glass, and it will require 8,000,000lbs. of iron, and 100,000 square feet of glass. The roof is 200ft. by 652 feet. It is expected to be completed by the first of January.

Encounter between a Liverpool Architect and a Burglar.—Somewhat later than his usual hour, on Tuesday evening week, Mr. J. N. Crofts, architect, of Cook-street, Liverpool, was sitting in his office writing, when he heard the lock of the room door tried twice. On going into the lobby he encountered a tall powerful fellow, who had by some means broken into the lower part of the building. Mr. Crofts at once seized him, and a long and severe struggle ensued, during which Mr. Crofts was thrown to the ground several times, but he continued to hold the fellow until the arrival of a policeman. On being brought up before the magistrates the man was remanded.

Improvements at Halifax.—On the 15th ult. the formal opening of the new road from Halifax to Southowram, and of the western half of the new North Bridge across the River Hebble, took place. The Mayor presided at the ceremony, giving the name of Beacon-hill-road to the new highway. The road has cost £12,000, and the bridge, when completed, will have cost £20,000.

The Proposed Great Western Maritime Ship Canal.—The projected Great Western Maritime Ship Canal is now attracting considerable attention. According to the *Mining Journal*, the capital required to construct it (£3,500,000) will no doubt soon be asked for from the public. The success of the Suez Canal has given increased confidence to the promoters in the practicability of their proposition. The construction of the canal would do much to open up a much enlarged market of South Wales coal in all the counties south of the line of the Thames, and would diminish the distance between the South Wales coalfield and the various French ports, avoiding, at the same time, the principal difficulties of the voyage. The canal is to be 59 miles long, and 21ft. deep, the width being at the bottom 31ft., and gradually increasing to four times that width at the surface, It will extend from Bridgwater Bay in the Bristol Channel to Exmouth on the south coast of Devonshire, and it is estimated that from

4,000,000 to 5,000,000 tons of coal will be taken through annually. A harbour of refuge is proposed to be established in connection with the canal. The project originated with Telford in 1825, and it is now being promoted principally by Mr. F. A. Owen.

◆

Chips.

Mr. William Stork Beckit, the architect of S. Martin's Church, Lincoln, writes to say that the statement in our last issue that the lowest tender for the erection of the church was £2,000 above his estimate is untrue, the lowest tender being only £250 above his estimate. Our statement was taken from the *Lincolnshire Chronicle* for August 26.

The Melton Mowbray new Cattle Market was opened on Tuesday last.

A new Free Church, seated for 300 persons, was opened on Sunday week at Lumphanan, Deeside, Aberdeenshire.

A new Temperance Hall is in course of erection in the Cleethorpes-road, Grimsby, from plans by Mr. G. Siminson. The cost will be upwards of £1,200.

Three groups of stone carving in basso relievo, executed by Mr. Ruddock, of London, may now be seen on the south porch of S. Swithin's Church, Lincoln. The three groups refer to various events connected with S. Swithin's history, and the cost is to be defrayed by the architect, Mr. Fowler, of Louth.

On the 22nd ult. the employés of Mr. George Punnett, builder, Tile House Works, Tunbridge, held their annual holiday, when about 160 of the home department visited the Crystal Palace. On the same day about 160 men of the same firm, and now employed at Hawkhurst in the erection of a mansion for the Right Hon. G. J. Goschen, M.P., President of the Poor Law Board, had an excursion to Hastings.

The original chancel arch of S. Peter's, Cumberworth, Alford, has been restored, and a new arch of Ancaster stone added. Columns which had been plastered up in the walls many years were brought to light. Other improvements now in progress are a new roof of Baltic timber, supported by twelve braces, on corbels; a new two-light north window, in character with the original, and modern benches instead of the old high pews. It is also proposed to build a new porch.

A handsome new tower, together with a spire and clock, in connection with the parish church of Rothes, is now all but completed. The total cost will be about £200.

The works in connection with the Serpentine are now reported as being pushed vigorously forward. The contractor has now engaged a large additional number of men, who are actively engaged for many hours per day.

The site selected by the Corporation of London for the Foreign Cattle Market is situated on the West side of Deptford. It has not yet been approved of by Government, and it is possible a larger frontage may be deemed desirable.

The inhabitants of Kew and Brentford have appointed a committee to take steps for freeing Kew-bridge from toll, in accordance with the act of 1869.

About two-thirds of the capital required for the erection of the new Town-hall and Museum at Nairn has been subscribed.

The church and congregation worshipping at Sion Chapel, Bridge-street, Bradford, of which the Rev. J. P. Chown is pastor, are engaged in the task of raising funds for a new chapel and schools, at an estimated cost, including the site, of not less than £12,000. The plans for the new buildings are now under consideration.

The Corporation of Glasgow made a profit of £19,619 on the supply of gas to that city last half-year. Of this amount the greater portion will go to wipe off the expenses of the transfer from the old companies, and £5,000 will be credited to the ordinary funds of the Corporation. The ratepayers of Glasgow are to be directly benefited by a reduction in the price of gas.

On the 25th ult. the foundation stone of a new Wesleyan Chapel was laid at Earl's Barton. The estimated cost is £1,050.

Two memorial stones of a new Baptist Chapel were laid on Monday week at West Coseley, Bilston. The contract for the new chapel, exclusive of heating apparatus, is £1,150.

It is in contemplation to insert a new stained glass window in the choir of Hereford Cathedral.

The foundation stone of new Wesleyan Schools at South Stockton was laid last week. Accommodation is to be provided for 300 children, at a cost of £600.

The foundation stone of a new Wesleyan Chapel was laid at Weymouth on Wednesday week.

Savernake House, near Marlborough, Wilts (the seat of the Marquis of Ailesbury), is now receiving important additions. The right wing, hitherto incomplete, is in the hands of an army of workmen. The outlay will be about £10,000.

S. Peter's Church, Dover, East Cliff, has been reopened after restoration. The elevation of the roof has been increased, and the chancel and north transept extended.

The Rector of Hadleigh, Suffolk, is soliciting subscriptions towards the restoration of the parish church. Mr. Valpy, architect, has surveyed the building, and estimates the cost of the proposed works at £1,100.

The Portland Stone Company lately took on about 30 additional men for a roach order, but these have since been stopped for a time.

It has been decided to restore the Lady Chapel of Chichester Cathedral, as a memorial to the late Bishop Scott.

S. Helen's Church, Ore, near Hastings, was consecrated on Friday last.

The Earl of Zetland has laid the foundation stone of a new Masonic Hall at Redcar. The style of the building will be Italian.

THE BUILDING NEWS.

LONDON, FRIDAY, SEPTEMBER 16, 1870.

ANNUAL EXHIBITION AT MANCHESTER.

THE Fiftieth Exhibition of Works of Modern Artists was opened last week in the galleries of the Royal Institution in Mosley-street, Manchester. Originally destined for the display of works of painting, sculpture, and architecture, the present year's exhibition too closely emulates that of the Royal Academy—the works exhibited consisting nearly entirely of paintings in oil and water colour: sculpture being represented by scarcely a score of contributions, chiefly in plaster; whilst architecture has even improved on the Royal Academy rôle, and does not even put in an appearance! There are, indeed, architectural subjects exhibited; but these are paintings of existing buildings: not, what might in former years have been seen on the walls of the Royal Institution, designs by metropolitan or local architects for edifices intended or imagined. The fact is greatly to be deplored. It has its cause, we fear, in the unhealthy rage for perspective representation, not only linear but aërial, that has afflicted our architects for the last thirty or forty years. They manage these things better in France; as any one may see by the public interest taken in the beautiful geometrical drawings of M. Lamiere, at South Kensington, and the public indifference which the pictorial paintings of our own architects (or their artists) meet with at the Royal Academy or the Architectural Exhibition. Surely there is a moral in all this, and an entirely new régime demanded, if we would educate the public in a noble art, being somehow elbowed out of our Fine Art galleries, both in London and in the provinces. People who have been just admiring the landscapes of Stanfield, Linnell, or Lee, don't care to gaze with interest on the "perspectives" of Mr. Pecksniff, bedight though they be with those wonderful foregrounds and figures, "put in" by the popular architectural colourist of the day. Moreover, the brush of the latter is too ubiquitous on the walls not to be tiresome. Let us leave the painters to themselves, study perspective, if we will, and apply it in our studies; but, in our appeals for public appreciation, rely more often upon sound geometrical drawing.

There are, we said, architectural pictures contributed to the Exhibition. We will proceed to notice them before giving any description of the other works exhibited.

No. 459, by A. MacCallum, is a large oil painting of the "Houses of Parliament from Lambeth," an excellent subject, very unsatisfactorily treated. The drawing is pretty faithful, if we except a very pardonable deviation of the painter's from the precise form of the actual finish of the Victoria Tower; but in one important particular the view is quite deceptive. Let any one conceive a prospect of the Houses, taken, as it would seem, from Lambeth Bridge; which, albeit it shows the Thames Embankment in course of construction, omits all representation of the new Westminster Bridge. As a piece of chiaroscuro the composition is a very unpleasant one; the river below and the sky above being streaked here and there with large blotches of yellow fog, for no very obvious purpose save that of caricaturing our London atmosphere. The picture, oddly enough, is hung side by side with No. 463, a portrait, somewhat affected in its attitude, of Dr. Barry, of King's College, the architect's son.

No. 307, "Caen," by W. W. Deane, is a very spirited and faithful painting in water-colour, bought up (and very cheaply too) on the first day's exhibition. The subject is S. Pierre, seen from the quay on the north side of the cathedral, looking towards San Sauveur's. The purchaser has borne off the best architectural picture in the exhibition, rich in intelligent delineation of some of the picturesque bits of old France, that are, alas, passing out of existence in these sad days of "civilization." On the same wall hang two other architectural pictures—No. 388, "The Town-hall, Cologne," by A. E. Everitt, and No. 369, "Wych-street, London," by Miss Louisa Rayner. We prefer, of the two, the lady's water-colour painting, putting in, however, a modest demurrer to a slight liberty taken with the steeple of S. Mary-le-Strand. Cologne Town-hall is depicted as seen after a snow-storm, with its Palladian details, crude and stiff, brought out into somewhat oppressive relief, so to speak. The painting is, in fact, too architectural to be pleasing. No. 206, "Abbeville," by R. E. Holding, is a very indifferent production. The turreted corner of a Continental street is obviously too ambitious a subject for the artist, with his present training in perspective. No. 275, "Temple Bar," by Miss Rayner, is a meritorious little work, very badly hung. No. 305, "Interior of the Church of Caudebec, on the Seine," by John Burbidge, struck us as one of the best works of its class—the picture well conceived, and the artist evidently at home with his subject. No. 341, "Interior of Ypres Cathedral," by Wyke Bayliss, exhibits, apart from its cloudy, opaque handling, a perversely-chosen subject—an aisle with lateral chapels filled with "pestilent Renaissance" fittings, in midst of which is (what we must presume the artist beheld as he painted the scene) a priest saying mass, with a big book in his hands! Opaqueness is by no means a common defect in the productions of our national artists. We have exhausted the list of them who have this year contributed architectural subjects to the Manchester Exhibition, if we except, as we must, some minor works of the kind, too bad to either hang or criticise. Foreign painters, however, contribute some pretentious architectural works, very inferior, as we think, to those of our own countrymen. In No. 524, "Ruins of a Villa at Rome," by A. Vertunni, we have, it is true, a magnificent exception; but in Nos. 424, "Interior of the Church of S. Jacques, Antwerp," T. Cleynheus, and 379, "The Choir of Santa Maria Novello, Florence," we have examples of the opaque handling just condemned. Both of these subjects—very tastelessly chosen by the way—are treated in a provokingly dull, literal, lifeless manner, which we should be sorry to see our own painters affect. There is no life, nor motion, nor air in such paintings. We hear of lawyers who will prove that black is white, and vice versâ, as the case may need; but with these Dutch and Belgian architectural painters, blacks, browns, greys, and greens, once committed to the canvas, know no alternations of light or shade, but assert themselves in the picture with monotonous intensity; the outlines are, moreover, crude and harsh, imparting a weird, repulsive aspect to the composition. Speaking of foreign contributors to this exhibition, we may add that great complaint is made that, while local artists have been made amenable to the rule of the council restricting exhibitors to two contributions, one foreign artist, Signor Vertunni, has been allowed to exhibit no fewer than five pictures. They are all of them large costly paintings, and, it must be confessed, very fine ones.

The principal sculptors who contribute are Mr. E. G. Papworth and Mr. J. Lawlor, the contributions of the former being all portrait busts, without interest of any kind as works of art; but many of Mr. Lawlor's works—such No. 547, "Head of a Nymph"; Nos. 546, "The Rose," and 546, "The Lily,"—are remarkable for their grace and delicacy of conception.
